These policies had been introduced in many third world countries (mainly in Africa and South America), since the early 1980s. A constant feature of the adjustment policies adopted in these countries was the rolling back of many gains of the previous decades—however insubstantial they may have been—in the areas of health, education and food security. In the last two decades the World Bank has emerged as the key spokesperson on almost all sectors, including social sectors like health. Armed with the clout to follow up its prescriptions, the Bank has marginalised bodies like the World Health Organisation (WHO) and UNICEF in policy matters. The World Bank commented on the early trends set in motion by adjustment policies in Africa and South America in the following manner, "Because cuts in government spending are usually central to an adjustment programme, health spending is likely to be reduced. In many countries early cuts were indiscriminate and failed to preserve those elements of the health system

with the strongest long-term benefits for health" [WDR 1993:51].

But much before the World Bank woke up to the damage done by the structural adjustment policies, other international bodies had already been drawing attention to this. The UNICEF commented, "For the first time in the modern era, a subcontinent is sliding back into poverty. The number of families in sub-Saharan Africa who are unable to meet their most basic needs have doubled in a decade. The proportion of children who are malnourished has risen" [UNICEF 1993:48]. The UNICEF went further in squarely blaming such conditions on the debt burden imposed by the Bank's policies on these countries, noting: "The total inhumanity of what is now happening is reflected in the single fact that even the small proportion of interest which Africa does manage to pay is absorbing a quarter of all its export earnings and costing the continent, each year, more than its total spending on the health and education of its people" [WDR 1993:45], and further, "Great change is in the air as the 1990s begin...And great change is needed if a century of unprecedented progress is not to end in a decade of decline and despair for half the nations of the world. In many countries poverty, child malnutrition and ill-health are advancing again after decades of steady retreat. And although the reasons are many and complex, overshadowing all is the fact that the governments of the developing world as a whole have now reached the point of devoting half of their total annual expenditures to the maintenance of the military and the servicing of debt [UNICEF 1991:1]. The impact of these policies were reflected in rising mortality and morbidity figures (Table 1).

As a result of the realisation of the disastrous impact of the early structural adjustment programmes in many countries, there was a move towards toning down of many of the prescriptions for the adjustment process—the so-called "adjustment with a human face". This shift did not fundamentally endanger the adjustment policies in these countries, but at the same time initiated some sort of "disaster management". It is in this

context that the World Bank introduced the concept of a 'safety net' for the poorest, who were feeling the brunt of the adjustment policies most acutely. The term used is in itself interesting, implying as it does the hazards associated with the adjustment policies—thereby requiring the use of a safety net.

The need for a safety net is not determined by any altruistic concerns for the victims of adjustment policies in developing countries. Rather, they are an extension of the very same concerns which led to the World Bank/IMF combine pushing for the adjustment policies in the first place. Internal contradictions within the ranks of market economy countries in the 1970s fuelled the urgency for carving out third world markets. The precise mechanisms tailored to efficiently carve out the 'global cake' was pushed through in the 1994 GATT agreement. But much earlier, the World Bank had moved to initiate the structural adjustment programmes, which it hoped, would make markets of the third world freely accessible on one hand, and at the same time would bring an element of stability in these markets for long-term exploitation.

In the schema of seeking out markets in the third world, India occupied an almost unique position. The 'middle class' consumer market in the country is estimated to cater to a population of around 100 million—i.e., larger or comparable to the total market in

the largest countries in Europe and about 40 percent the size of the entire domestic market of the US. There is thus a special interest in 'prising' open the Indian market for various global players to exploit. In order to nurture this market it is also necessary to increase extraction of surplus value from the 800 million who do not constitute a part of this potential market. In other words, policies designed, on the one hand, to increase the paying capacity of the target population in the potential market and, on the other hand, to keep the rest of the populace at a level of mere subsistence.

However, as noted earlier, the signals emanating from the countries that had taken up structural adjustment programmes in the early phase, were disturbing for those interested in exploiting untapped third world market. Disturbing not because of its actual effects, but because the effects threatened to totally disrupt the stability of these countries, and thereby of their markets. The safety net formula was hence required to bring back a semblance of stability in these countries, and had to be extended to countries now going in for structural adjustments, so as not to repeat the past experience.

The safety net formula can thus be also seen as a partial strategic retreat of the earlier World Bank prescription of near total withdrawal of the state from all social and infrastructure sectors. While the World Bank continues to espouse policies geared towards private takeover of other infrastructure sectors like power, telecommunications, etc., in the area of health and education it has had to make certain concessions to the logic of state support. However the attempt is still to formulate a package which involves minimum state involvement. The intent is not to make provisions for comprehensive health care that required, in the words of the Alma Ata Declaration of 1978, "All governments should formulate national policies, strategies and plans of action to launch and sustain primary health care as part of a comprehensive national health system and in co-ordination with other sectors. To this end, it will be necessary to exercise political will, to mobilise the country's resources and to use available external resources rationally." The World Bank, in sharp contrast, believes in the necessity for a political will to restrict health care access when it says, "As policy-makers try to reach compromises, they must deal with powerful interest groups...and strong political constituencies, including urban dwellers and industrial workers" [WDR 1993:45].

II

Impact of Reforms on Health Sector

These are really the ideological underpinnings of the reforms process, which have moulded the content and reach of

reforms initiated by the previous government on the health sector. The immediate fallout of the new policies was a cut in budgetary support to the health sector. The cuts were severe in the first two years of the reform process, followed by some restoration in the next three years (Table 2).

Some interesting facts emerge from the above figures. While between 1990-91 and 1993-94, there was a fall, in real terms, of expenditure on health care both for the centre and the states, it was much more pronounced in the case of the states. Expenditure for states, even in 1993-94 was lower than in 1990-91, though it had risen in the case of central government expenditure. Moreover, the percentage of expenditure incurred by the states on health care, as a percentage of total developmental expenditure incurred by them, remained fairly constant. What however did happen in this period was a compression of total developmental expenditure of state governments. Thus expenditure, in real terms, for state governments plummeted in 1991-92 and 1992-93, and just about touched the level of 1990-91 in 1993-94. But by 1993-94 central government expenditure had increased by almost 20 per cent over the level achieved in 1990-91. The fall in expenditure by state governments is a direct consequence of the reforms. States, in this period, were starved of funds due to lower transfers as well as due to the yield from shareable taxes (i.e., taxes in which states get a share) falling from 5.6 per cent of GDP in 1990-91 to 5.1 per cent in 1993-94. This squeeze on the resources of states was distributed in a fairly secular fashion over expenditures incurred under all developmental heads. Health care was a major casualty as the share of states constitutes a major (approximately 75 per cent) portion of expenditure. A similar kind of squeeze in resource allocation was felt in all programmes, largely financed by the states, including water supply and sanitation. In contrast even in the worst 'resource crunch'

years, the almost exclusively centrally funded family planning programme fared much better.

The above indicates the broad trends, but the inter-state differences bring out even more interesting nuances. Table 3 shows revenue expenditures in states between 1990-91 and 1992-93. The table indicates a distressing trend. While revenue expenditures (i.e., largely expenditures for sustaining ongoing programmes) stagnated or improved marginally for the middle income and richer states, they fell sharply for the poorer states. Further, the fall was more dramatic in the case of expenditure on public health. Public health includes the major disease control programmes, considered as national priority areas, viz., malaria, tuberculosis, diarrhoeal

diseases, kala azar, etc. States tended to try to maintain expenditures at previous levels on medical care, a bulk logically flowing to institutions clustered in urban areas. Thus, in a period of compression of available resources, the most vulnerable states shifted funds away from programmes designed to benefit the most vulnerable sections. In practice, quite the opposite of the concept of 'adjustment with a human face' advocated by the World Bank. Table 4 gives the budget allocations for health in 1991-92 and 1992-93 for the poorer states. Except for Bihar, allocation fell sharply for all the other four poor states of Uttar Pradesh, Rajasthan, Madhya Pradesh and Orissa after 1990-91. In the case of Uttar Pradesh and Rajasthan the fall was as high as 40 per cent. It should be remembered that collectively, these five states account for in excess of 45 per cent of infant deaths in the country. Compression of funds available with states is likely to have had a number of other far reaching effects. Generally, expenditures on salaries tend to take up an inordinately large part of total expenditure. Table 5 is indicative of this. Salaries constitute 70-80 per cent of expenditure for most major programmes, and the trend is most distorted in the case of rural programmes, viz, rural hospitals and primary health centres. Faced with limited funds, while salaries still require to be maintained at previous levels, the burden of cut-backs are increasingly placed on supplies and materials. Ultimately a skeletal structure survives, incapable of contributing in any meaningful manner to amelioration of ill-health.

Expenditure patterns on health care are grossly skewed in favour of urban areas (Table 6). Expenditure cuts further distort this picture with the axe on investment falling first on rural health services. Table 7 shows the pattern of expenditure for different states, under the Minimum Needs Programme in the health sector, which targets the rural health sector.

Here again the effects of compression of resources are evident. For the whole of India, there was a decline in expenditure of 9.3 per cent in real terms, if the figures for 1990-91 and 1993-94 are compared. Moreover, there was a decline in real terms in expenditure in the case of seven of the 15 major states. Among them, Uttar Pradesh and Bihar showed the greatest decline. It must be remembered that expenditure under the Minimum Needs Programme are under the heads of rural health, rural water supply, urban slums and nutrition – all areas qualifying for special attention under the 'safety net' concept of structural adjustment programmes.

As a result of this rolling back of state support to health care the first major casualty in infrastructure development has been the rural health sector. There has been a

perceptible slowing down in infrastructure creation in rural areas (Table 8).

The problem of gauging the actual impact of these cuts in spending and infrastructure development on mortality and morbidity indicators, is the notorious unreliability of health statistics in the country.¹ From the limited data available, the trends though equivocal, do appear to suggest a slowing down of the gains of the past few decades. Infant mortality figures (Table 9) are not as startling as the figures for Africa cited earlier, but do indicate cause for concern. The IMR in the first half of the 1990s does suggest a major slowing down in the rate of fall. This is further borne out by data available for the states (Table 10).

The IMR figures for major states indicate a slowing down in the rate of fall in IMR in the post-reform period. Ten states showed a slower rate in fall of IMR between 1989-91 and 1992-94. Only West Bengal, Andhra Pradesh, Karnataka, Madhya Pradesh and Uttar Pradesh showed an increase in the rate of fall of IMR in the period under review. These indications however are as yet equivocal and nowhere near the drastic rise in IMR seen in some African states. Of course, one possible explanation for this could be the fact that it takes 3-5 years for the impact of reduced health care facilities to be reflected by mortality indicators. Further, cut-backs in social sector expenditures in countries following adjustment policies in the early 1980s were much more severe than what was seen in India. In India, after 1993-94, there was even a trend towards restoration of many of the cuts exercised in the initial years of the reforms. The latter, was probably less an admission of the flawed logic of the reform process and more a reaction to political exigencies following repeated reverses faced by the Congress Party in state assembly elections across the country.

III

Conferring Legitimacy to the Market

The extent of cuts in health sector funding by the state and the consequent impact, as part of the reform process, are in a sense peripheral issues. The central issue that needs

attention is the theoretical underpinning of the reform process vis-a-vis state involvement in social sectors like health. It is important to take note that structural adjustment policies are geared to restructure the economy in a certain manner and not to improve welfare measures. Reforms initiated in this country and elsewhere start from the premise that present levels of subsidies to the social sectors are unsustainable. So prescriptions for restructuring of the health sector are designed, not to provide the best possible health care but to maximise outputs from greatly reduced state support. Much of the theoretical justification for this is spelt out in the *World Development Report of 1993* titled *Investing in Health*. It states for example, "Adoption of the main policy recommendations of this Report by developing country governments would ... help to control health care spending. Millions of lives and billions of dollars could be saved." The report further adds, "Using cost-effectiveness to select health interventions for public financing does not necessarily mean spending the most resources where the burden of disease is greatest. Instead, it means concentrating on the interventions that offer the greatest possible gain in health per public dollar spent."

An abiding concern of the reform process in the country has been the need for the state to withdraw from areas of infrastructure. It

is a germane question, whether such areas are at all amenable to market forces, and if so at what stage. As has been pointed out, "It is common knowledge that savings/investments (and labour productivity and incomes) are low in a developing country. There is no 'market demand' for basic infrastructure services. This is where Adam Smith's famous argument in favour of the state – erecting and maintaining those public institutions and those public works, which, though they may be in the highest degree advantageous to a society, are however, of such a nature that the project would never pay the expense to any individual or small number of individuals, and which it therefore cannot be expected that any individual or small number of individuals should erect or maintain – becomes obviously relevant" [Ghosh 1994].

It would be interesting here to examine in some detail the kind of spending that is done by countries on health care and the percentage of such spending that is borne by the public sector. Table 11 gives the comparative figures.

An analysis of this data shows very clearly that countries with higher income levels spent a larger percent of gross domestic product on health and, further, these countries also have a significantly higher percentage of these costs paid for by the public sector. Except the US, in all the large market economy countries the share of public sector in total health expenditure is in excess of 70 per cent. Even the US, with 44 per cent of health expenditure coming from public funds, is way ahead of India in this regard. Thus, what we have here is a clear illustration of the fact that market economy countries have been consistent in following the logic that development of health infrastructure requires state funding. Yet economic reforms in the country, initiated arguably at the behest of these very countries, that in order to accelerate economic growth developing countries must cut public spending on health infrastructure. This is however not a novel method of argumentation any more – we have heard similar logic being put forward in the pressure being put on developing countries to change consumption patterns in order to reduce the threat of 'global warming' while the global north can, with impunity, continue its unsustainable consumption pattern.

India's situation in terms of spending of health care is unique on two counts. At 6 per cent of GDP spent on health care, India spends more on health care in per cent terms than most developing countries. At the same time, at 21.7 per cent, public spending of the total expenditure on health care, India is one of the lowest in the world, both in actual terms as well as in percentage terms. Health spending in India is thus already

heavily distorted in favour of the private sector. It should be understood that the extremely low level of public funding in India is not a new phenomenon that post dates the reforms process. In fact successive Five-Year Plans have shown a fall in percentage terms, in budget allocation for health care (Table 12).

There has been little effort towards sustained investments to build up health care infrastructure in the country. To be fair, periods of stagnation have been punctuated by sporadic efforts to enhance public health funding. Mention may be made in this context, of the National TB and Malaria programmes of the 1950s and 1960s and the primary health care programme in the late 1970s and early 1980s. In the case of all these programmes, much of the earlier gains were frittered away as the initial infrastructure created was not supported in later years by matching investment. In fact

between 1985-86 to 1990-91 there was already a major slow down or decline in state expenditures on medical and public health. This was more glaring in the case of capital expenditure for the setting up of new infrastructure (Table 13).

These experiences have prompted some to suggest that health expenditure at enhanced levels cannot be sustained and hence alternative strategies need to be considered which do not look upon the state as the sole supporter of health programmes. It is sought to be argued that public funding is already low in most developing countries, and a formal role for the private sector, with the state acting as a regulator of the market for health care, will only work towards making the present system more efficient. Unfortunately, in the health 'market', those who need health care the most are those who are the least likely to be able to pay for it. The economic reforms in this country appear

to be further compromising the ability of people to pay for health care. In fact today, after dowry, private expenditure on health care is the commonest cause for rural indebtedness.

The issue really is what is the minimum level of public health expenditure necessary to build the momentum for a health infrastructure that can be sustained with additional resources generated from private sources. While a ready formula for the same is not available, one has to fall back on the experiences and practices of the economies we are believably trying to emulate – be it the Asian 'success stories' like South Korea, Taiwan or Malaysia or market economies in western Europe, North America or Japan. My observations of public spending on health in these countries show that public health expenditures in India do not approach anywhere near the levels in these countries. Even the World Bank is constrained to comment, "Adoption of the package (of minimum health interventions) in all developing countries would require a quadrupling of expenditures on public health ... There (in the poorest countries), paying for an essential package will require a combination of increased expenditures by governments, donor agencies, and patients and some reorientation of current public spending for health" [WDR 1993:11]. But the crux lies in mobilising the extra resources to quadruple spending on health. Except in sub-Saharan Africa, such aid accounts for, 1.5 per cent or less, of the total spending on health in developing countries. NGOs are dependent on either foreign donors or government funds, or act as a part of the private sector. User fees from patients account for less than 5 per cent of the total public health expenditure. Even optimistic estimates for the IDA-aided State Health Systems Development Project – underway in Karnataka, West Bengal and Punjab – put the possible recovery from user fees at 15-20 per cent of public health expenditure. A far cry indeed from the 'quadrupling' necessary for a 'minimum' package.

It should hence be obvious that international agencies like the World Bank, who have been instrumental in pushing adjustment policies in the third world, really have no answers regarding how health infrastructures are to be sustained after even the inadequate state support is further trimmed. Rhetoric regarding 'wasteful' government expenditures and the extolling of virtues of non-governmental organisations and the private sector are meant to obfuscate the central issue. Even the UNICEF is constrained to point out, "Its (the World Bank's) implication continues to be that markets can do little wrong and that all economic growth is necessarily to the good... government intervention in the economy, on

the other hand is always regarded as guilty until proven innocent" [UNICEF 1993:34]. While the vision of an efficient private sector that will provide clean beds in hospitals, helpful hospital employees and prompt service is seductive, one cannot forget that for the vast majority of Indians this can at best remain a seductive dream. Such services come at a price that only a minuscule minority can afford. It is instructive to note that when plague hit Surat, it was the public health system that was left to provide succour while the private facilities folded up and disbarred plague victims. In the immediate context the alternative to poor public health facilities cannot be high-priced private facilities, but strategies to improve the public health infrastructure.

This is not to suggest that optimal use has been made of public health expenditure in the country before the reforms process. In fact, quite the contrary. Much of the blame for what is today being termed the "resurgence of communicable diseases" lies in strategies adopted well before the reforms programme in the country. These strategies relied on various centrally administered programmes (vertical programmes) for disease control and prevention. Such programmes included the national programmes on tuberculosis, malaria, leprosy, immunisation, diarrhoeal diseases, blindness and family planning. With no integration at the level of delivery, these programmes were insensitive to local conditions, unresponsive to local needs, highly bureaucratised and inefficient. These programmes were accountable to officials situated in the national and state capitals, and had little or no flexibility based on local conditions. Local populations were indifferent and in some cases hostile to such programmes, resulting in fair measure to the very poor utilisation of government health facilities in many areas.

The prime example of vertical programmes undermining the health care programme in the country has been the country's family planning programme. An assessment of the programme in its four and half decades of existence raises many interesting issues. Today acceptors of contraception constitute

just 43 per cent of couples in the child-bearing age group. This, in spite of massive central funds being pumped into the programme. Even this is likely to be a major overestimation, linked to overreporting – a bane of the target-oriented approach – and to the fact that a large proportion of acceptors are older women who have undergone tubectomies. The programme can hardly be held responsible for the few success stories in population planning in the country – Kerala and Tamil Nadu. Kerala's success in achieving results comparable to countries in the developed world – *vis-a-vis* both demographic and health indicators – have been widely attributed to factors such as high minimum wages, land reforms, high literacy rates and access to universal health care. Much of Tamil Nadu's success in pegging down birth rates in recent years is being attributed to improved child survival due to the massive statewide feeding programme for undernourished children. Both experiences strengthen the maxim that 'development is the best contraceptive'.

Experiences within, as well as outside the country, shows that a reduction in population growth rates follow overall socio-economic development. Except in conditions of war and famine they seldom precede such development. Yet this has largely been ignored during our planning process, possibly

as it prevents our planners from blaming the country's tardy development rates on the pressures posed by population increase. As a result family planning strategies have tended to be paternalistic, prescriptive and coercive. Such a strategy has undermined the effectivity of the general health care infrastructure as well as the faith that women have in this infrastructure to address their real concerns. Most programmes have tended to view women as assembly line appendages required to produce babies. Thus a woman's health becomes important only when she is pregnant or lactating. But in India 65 per cent of deaths in women are due to infection related causes and only 2.5 per cent of deaths are related to childbirth. Even among women in the reproductive age group only 12.5 per cent of deaths are due to childbirth associated causes.

Attempts to integrate the vertical programmes recently within the primary health structure (since the 1980s) had, if possible, even more disastrous consequences. Public health experts have repeatedly argued in favour of integrating the vertical programmes within the primary health care structure to ensure better co-ordination and a more holistic approach to health care. However, the manner in which this integration was done, resulted in even greater chaos. The programmes were integrated without serious attempts to strengthen the primary health care network. Thus, almost overnight, the multipurpose worker at the sub-centre was saddled with responsibilities to look after a host of vertical programmes. As a result even the limited gains of some of the vertical programmes (viz, malaria, tuberculosis, etc) were frittered away. The situation was compounded by the fact that the sub-centres and primary health centres (PHCs) were woefully lacking in facilities and manpower to properly co-ordinate the integrated programmes. In 1995 49.97 per cent of sub-centres and 37.18 per cent of PHCs had no buildings of their own. Further, 5.21 per cent of PHCs had no doctors and 22.58 per cent of sub-centres were working without health workers.

As a consequence, the greatest killers in 1996 are still familiar diseases like cholera, TB, malaria, kala azar, and worse of all hunger. In the case of malaria for example, from an estimated incidence of 75 million cases and 0.8 million deaths in 1947, the figures fell to 0.1 million cases and virtually no deaths by 1964. But by the early 1970s the disease was back in business again, with seven million cases reported in 1976. The incidence figures have been pegged down at roughly two million cases every year but what is alarming is the steady rise in the number of deaths due to malaria in the last few years. Today there are tribal pockets where over 50 per cent of people test positive

for malaria. April 1995 saw outbreak of Falciparum malaria in Assam resulting in the loss of many lives. Large number of cases of malaria were also reported from Bihar, MP, Orissa, West Bengal and other states. Malaria epidemics are known to be associated with economic depression.

Similarly, kala azar virtually disappeared by the mid-1960s, but was back in epidemic form by 1977-78. In 1991, 77,100 cases were reported with an estimated 5,000-7,000 deaths. The experience with filaria has been even more disappointing, and the number of cases have shown a steady rising trend in spite of the National Filaria Control Programme. Deaths due to tuberculosis have remained steady at 3,00,000-5,00,000 per year. Gastrointestinal diseases associated with diarrhoea and vomiting has also shown similar trends. Cholera was one of the largest killers at the turn of the century. While the first two decades after independence saw a dramatic fall in the number of cases, today major metropolitan centres like Calcutta, Madras and Delhi, regularly report epidemics of cholera. Prevalence of worm infestation is estimated at about 70 per cent of the population and there are an estimated three lakh to five lakh cases of typhoid every year. The outbreak of plague in 1994 in Beed and Surat, has brought into sharp focus the growing crisis of public health. It is evident that the top down strategy of vertical disease control programmes and the belated slipshod attempts to integrate them have failed to deliver. Disease surveillance has been a major casualty with the primary health care system ill prepared to undertake the task.

A major determinant of the morbidity and mortality load in the country is malnutrition. In India 63 per cent of children suffer from some form of malnutrition - this adds up to a staggering 75 million children, that is more than 40 per cent of the estimated 170 million children in the world suffering from malnutrition. Of these, 30 million suffer from severe malnutrition. Probably because

the statistics are so staggering, we have developed a defence mechanism towards an unpleasant reality. While infant mortality

and under-five mortality rates are reported to be on the decline, these rates conceal the ability of the modern state, armed with the tools provided by modern science, to maintain a much larger number of people at a level of bare subsistence.

The UNICEF has developed a scale for measuring progress of nations in tackling malnutrition in children. By using economic and nutritional data from all nations, the percentage of child malnutrition that can be expected for any given economic level, is calculated. The difference between this expected level and the actual level represents each country's national performance gap [UNICEF 1994:11]. The comparative figures show that India has the largest negative performance gap among all countries in the world (Table 14). In fact south Asian countries fare particularly poorly with respect to this index. An explanation for this may be sought in the widespread prevalence of landlessness in the peasantry, which is quite unique to this region. A major concern of the reforms programme in the country was to reduce food subsidies. Within a year of the initiation of reforms per capita monthly consumption of cereals had come down for rural and urban areas from 14.1 kg and 10.8 kg respectively in 1990-91 to 13.5 kg and 10.7 kg respectively in 1992 [NSS 48th Round 1994]. The effect of this squeeze on food consumption is likely to have an over-arching effect on all areas of public health.

It is against this background that an assessment of the reforms in health care in the country needs to be undertaken. The reforms do not constitute a watershed in terms of reduction in allocations and expenditure on health. Trends, as discussed earlier, of declining health expenditures were discernible before the reforms were initiated. The reform years have only seen an acceleration of this process. Within this, some other trends can be detected. In the reform years, the fall in state expenditures have generally been more precipitate, thus increasing the importance of centrally run programmes. On the face of it, such an approach is consistent with prescriptions of the World Bank for the health sector, in countries implementing structural adjustment programmes. The Bank, as mentioned earlier, favours implementation of a minimum package targeted at vulnerable sections – part of its safety net strategy. However in practice, the squeeze on states' ability to commit resources to health results in programmes losing steam after the initial phase of central funding. States, being starved of resources, are eager to garner central funds. But once these funds are not forthcoming and the programmes have to be sustained by allocation of non-plan funds from state budgets, such programmes are allowed to decay.

The period of reforms, however, does mark a watershed in one regard. The ideological barrage associated with the reforms package served to confer legitimacy to the virtues of the private sector and the market. This legitimisation of the state's withdrawal from infrastructural areas, including infrastructure in social sectors, is a signal contribution of the reforms era. In the process, the supposed inability of the state to sustain funding of medical care and public health seems to have gained acceptance. The new found legitimacy for the private sector in health care can now be openly 'showcased' as can the concept of 'user fees' for government run health facilities. It may appear strange that a greater role is being sought for the private sector in India when, as explained earlier, almost 80 per cent of health care expenditure is already accounted for by the private sector. Ambulatory care (that is care not requiring hospital admission) is already overwhelmingly catered to by the private sector. The public sector is today a major contributor only in case of hospital care and in preventive and promotive public health measures. Even in the case of hospitalised cases, an estimated 40 per cent are admitted to private facilities [Baru 1994]. The belief that it is possible to regulate the private sector and thereby regulate the 'health market' to provide efficient services seems to be grossly misplaced. The private health sector is chaotic and largely unregulated today. In rural areas it is comprised of untrained quacks and faith healers. It is indeed strange that the same government which has been accused of not being able to run its public health facilities efficiently, is being expected to regulate this private sector.

It is this legitimisation of the virtues of the logic of free market which has allowed the introduction of an IDA-aided project in three major states in the country without any significant debate (except to an extent in Punjab). The State Health Systems Development Project is being implemented in the states of Punjab, Karnataka and West Bengal. The five year project involves a loan of \$342.2 million (Rs 540 crore) from the IDA. The project is significant because it is the first systematic attempt at putting into

practice the twin prescriptions of involving the private sector (or NGOs) in primary health care and of levying 'user fees' at government run health facilities.

TABLE 12: CENTRAL PLAN ALLOCATION ON MEDICAL CARE AND PUBLIC HEALTH

	Total Outlay	Allocation on Health	Investment in Health as Per Cent of Total
First Plan (1951-52 to 1955-56)	1960.00	65.20	3.30
Second Plan (1956-57 to 1960-61)	4672.00	140.00	3.00
Third Plan (1961-62 to 1965-66)	8576.50	225.90	2.60
Fourth Plan (1969-70 to 1973-74)	13778.80	335.50	2.10
Fifth Plan (1974-75 to 1978-79)	39426.20	760.80	1.90
Sixth Plan (1980-81 to 1984-85)	97500.00	1821.10	1.86
Seventh Plan (1985-86 to 1989-90)	180000.00	3392.89	1.88
Eighth Plan (1992-97)	434100.00	7575.90	1.75

Source: Various budget documents and *Economic Survey*, 1995-96, government of India.

The objectives of the IDA-aided project include (i) strengthening management and implementation capacity of institutions; (ii) developing surveillance capacity for major communicable diseases; (iii) upgrading PHCs and improving access in select areas and by vulnerable sections; (iv) upgrading community, sub-divisional and district hospitals; (v) upgrading effectiveness of clinical and support services and (vi) improving referral mechanisms. All the stated objectives are laudable and would merit inclusion in the general objectives of the primary health care system in the country. The important caveat in the project is that these objectives will be linked to levying of user fees and contracting out chunks of the primary health care network to NGOs and private institutions. The project seeks to increase collection of user fees to 15-20 per cent of total recurring costs from the present level of less than 4 per cent. User fees are sought to be levied for those who do not qualify under a predetermined exclusion criterion in each state. The projected foreign exchange component of expenditures to be incurred include 15 per cent for civil works, 20 per cent for professional services, 10 per cent on furniture, 60 per cent on equipment, 12 per cent on locally manufactured vehicles, 90 per cent on imported vehicles, 20 per cent on laboratory supplies and 50 per cent on medicines.

The IDA project is an important landmark as it is a serious attempt at implementing many of the World Bank's prescriptions for health care in third world countries – levying user fees (a stated World Bank position since 1987), involvement of the private sector, targeting of services, reduction in permanent manpower, etc. In other words the construction of an orderly withdrawal route, for the government, from involvement in public health. Over the years, systematic neglect of government run facilities have sowed the seeds of discontent about these in the minds of the public. Now to test the waters, to gauge whether the discontent is deep enough to accept the government's withdrawal from the health sector. As a test case, a Rs 540 crore loan over five years – less than 5 per cent yearly support to the existing state budgets – is good investment for international funding agencies. The project will merit close scrutiny in the ensuing years in regard to its ability to qualitatively change the direction of health care funding and management in the country. In this respect the project's importance far outstrips the amount of loan involved.

IV

Reforms and Pharmaceuticals Sector

The pharmaceuticals sector in India had been one of the success stories in development of an indigenous, self-reliant industry. It is a sector that made impressive

progress in the 1970s and 1980s, largely as a consequence of focused policy level interventions. The progress in this period is all the more impressive given the state of the industry after independence.

In 1947 the Indian market was fully controlled by MNCs. In the 1950s, drug prices in India were one of the highest in the world – a fact commented upon by the Kefauver Committee (a US Senate Committee set up to study the working of pharmaceutical companies), which said, "As a matter of fact, in drugs generally India ranks among the highest priced nations in the world, a case of an inverse relationship between per capita income and the level of drug prices" [Majumdar 1986]. India was denied access to technologies for production of vital drugs. Antibiotic production finally started indigenously when Hindustan Antibiotics was set up with help from the World Health Organisation (WHO) and the UNICEF in 1954. Subsequently, IDPL was set up with the help of Soviet technology in 1961.

With the setting up of the Indian public sector, antibiotic prices fell by as much as 60 to 70 per cent. MNCs, in order to survive in the Indian market, slashed their prices and for the first time set up basic production facilities. In the 1960s, the Indian private sector set up substantial capacities for indigenous production of bulk drugs. However, the former, in view of their superior marketing network, managed to keep a stranglehold on the Indian market.

In 1974 the Indian government set up the Committee on the Drugs and Pharmaceuticals Industry (popularly known as the Hathi Committee). The Committee's recommendations were seen by many as a landmark for drug manufacture in the third world. Countries like Bangladesh and Sri Lanka were to borrow heavily from it. The Drug Policy of 1978 and the Drug Price Control Order (DPCO) 1979, were broadly based on recommendations of the Hathi Committee. For the first time, comprehensive and graded price control mechanism was introduced in the drug industry. The philosophy behind this graded system of price control was to make more essential

drugs cheaper. The 1978 Policy also reserved major areas in the market for different sections in the Indian sector – both private and public. These measures led to a rapid growth of the Indian sector, which soon gained the capability of producing most essential drugs. In 1980, the UNIDO identified India as one of the countries with capacity to produce all essential drugs indigenously.

The foreign sector continued to produce principally in low technology areas and increased production of inessential drugs. They showed little inclination towards increasing bulk drug production while increasing their production of formulations enormously. In essence they continued to play the role of trading centres. During this period, the public sector came to be increasingly marginalised.

But in 1986 the government, in a new policy, reversed many positive features of the 1978 Policy. The span of price controls were reduced, greater profitability was allowed, imports were liberalised and various production control measures were scrapped.

In the last two decades, while the Indian drug industry has grown considerably, a disturbing trend is discernible. Most manufacturers are vying for the up-market section of the Indian consumer who can pay heavily to 'buy' health care. Production of expensive drugs outstrip demand while less expensive drugs are in short supply (Table 15). Thus the indifference shown by companies towards production of low-cost essential drugs. In doing so the industry is also in danger of falling into a self-destructive loop where 1,000 manufacturers fight for the market for drugs among 5 per cent of the population who can pay. This will act

as a major constraint to further development of the industry.

In 1994 the government announced its new policy on drugs and pharmaceuticals. While continuing the trend set in 1986, the government reversed all positive features of the 1978 policy which had helped to build a self-reliant industry, the best of its kind in the third world, and comparable to those in many developed countries. In the new policy the government granted major concessions to the industry in terms of reduced price and production controls. They included the slashing down of the number of drugs under price control (Table 16) and increase in returns allowed for bulk drug manufacture. Domestic treatment of companies with 51 per cent foreign equity participation is now assured. Industrial licensing is no more required for manufacture of pharmaceutical formulations. Controls on use of imported bulk drugs have also been abolished (Annual Report, 1994-95, Ministry of Chemicals and Fertilisers).

The new policy has reduced the number of drugs reserved for the public sector have been reduced to only five (vitamin B1, vitamin B2, folic acid, tetracycline and oxytetracycline). Today when the global pharmaceutical industry is poised for a new revolution with the help of bio-technology, only the public sector has the capacity to compete with MNCs and ensure a self-reliant growth. No company in the private sector has either the inclination or the will to make the kind of investments necessary to keep pace with technological developments in frontier areas.

The basic plea from the industry (to which the new policy has reacted positively), is that the drug industry should be decontrolled – both with regard to production and pricing. However, the industry's claims that their profitability had been going down due to excessive controls is not borne out by facts. Profits as well as turnover of drug companies have shown a large increase in the period just prior to the announcement of the new policy (Table 17).

The underlying rationale of the 1994 policy is in line with the free market ethos of the reform process in the country. But to attempt to treat the drug industry like any other consumer goods industry, is tantamount to abandoning all concerns for the health of the people. A study of the production pattern of monitored bulk drugs shows that larger companies are not interested in producing bulk drugs, but rather prefer to act as mere traders and middlemen by concentrating on the formulations market. In such a situation there can be no justification in liberalising production controls, and in fact more stringent production controls are called for.

The market forces logic is even less applicable to the pharmaceutical industry

than other sectors. Unlike consumer goods, drugs are not purchased by the consumer on the basis of his choice or preference. They are purchased/ consumed on the advice of the medical profession. The drug companies have built a market for their drugs through their extensive marketing network. The consumers have little or no choice in such a 'rigged' market and are forced to buy anything and everything that doctors are 'induced' to prescribe by the 'friendly neighborhood' medical representative. This is surely not the best climate for market forces to stabilise prices.

The government's pious hope that market forces will work to keep prices of drugs stable has been belied and the country has witnessed a spiralling rise in drug prices since the 1994 policy (Table 18). What is possibly even more important is the manner in which the list of price-controlled drugs has been worked out. In the Drug Price Control Order (DPCO) of 1979 essentiality was the basic criterion used to decide upon the categorisation of drugs, and more essential drugs were kept under price control. The Kelkar Committee, which formulated the list of drugs for DPCO 1987, used essentiality as only one of the criteria. Other aspects like turnover of drugs, monopoly within a certain sector, etc, were also taken cognizance of. In the new policy, essentiality is not a consideration at all and reliance has been placed only on the turnover of drugs to determine which drugs are to be price-controlled. Obviously, the health needs have not been addressed at all by the policy.

The situation is compounded by the fact that there are an estimated 60,000 to 80,000 brands of various drugs available in the Indian market. In this situation of extreme anarchy the task of an already overstretched Drug Control Authority becomes almost impossible to cope with. A majority of the estimated 80,000 products in the market are either hazardous, or irrational or useless. There is almost no source of regular unbiased, authentic information on drugs available in the country. A bulk of medical practitioners depend on promotional material supplied by pharmaceutical companies. In this context a WHO report says, "There is an inherent

conflict of interest between the legitimate business goals of manufacturers and the social, medical and economic needs of the providers and the public to select and use drugs in the most rational way" [WHO 1993].

The need to increase drug production to Rs 15,000 crore by 2000 AD from the present Rs 9000 crore is repeatedly stressed both by the industry and the government. But no thought seems to be given to what kind of drugs this large volume would include. In the absence of a clear-cut policy to ensure and channelise drug production, there is nothing to prevent a major share of the production from being diverted into non-essential areas. The new policy has no ideas to offer in this regard and only talks of liberalisation as the answer. More liberalisation may well mean licence to produce more hazardous, irrational and inessential drugs.

After having built a self-reliant industry much of the gains are today sought to be frittered away. In recent years import dependence in the industry has grown (Table 19).

The excess of exports over imports is an illusion. Formulation production is a relatively much simpler exercise and even countries like Bangladesh are relatively self-sufficient in this area. Self-reliance in bulk drug production is actually the true indicator of self-reliant development of the drug industry.

The government would do well to go back to the Hathi Committee report of 1975 detailing the sins of omission and commission of the foreign sector in the drug industry, when it is set to roll out the red carpet for MNCs. Nothing has changed since then, in fact the situation has worsened. The foreign sector are the worst offenders when it comes

to production of irrational and hazardous drugs and non-production of essential drugs. In fact the small scale sector produces more bulk drugs than the foreign sector. The measures in the 1978 Drug Policy restricting this sector, is the single most important factor responsible for the growth of the Indian drug industry in general and the Indian sector in particular. The foreign sector has never in the past brought in new technology and will not do so in the future. Allowing concessions to them (in the form of national treatment to companies with 51 per cent foreign equity) will only result in emasculation of the Indian drug industry. Table 20 shows the comparative contribution of different sectors in different therapeutic groups. It clearly shows the reluctance of MNCs to produce drugs in areas of importance for the health needs of the country.

Steps to encourage R and D in the drug industry, mentioned in the new policy, are welcome. But, pronouncements cannot stimulate R and D efforts in a climate where the industry spends a mere 1-2 per cent of its turnover on R and D and most of the R and D done has very little innovative content. Moreover, the strength of the R and D base in the drug industry, for whatever it is worth, lies in the area of process technologies.

If the Indian Patent Act is changed in line with the GATT agreement, in one sweep this base will become meaningless. Today the industry is not, by and large in a position to invest in development of new product technologies. Investment required to develop a new product with definite therapeutic advantage is far in excess of the total turnover of most Indian companies. Compare the present R and D expenditure of about Rs 100 crore annually to the estimated cost of development of a new drug, which is about

\$ 300 million or roughly Rs 950 crore. In fact, anticipating change in the Patent Act many MNCs have closed down their R and D facilities in India. These include the facilities run by Ciba Geigy, Boots, Hoechst and Rhone Poulenc. A change in the Patents Act will greatly help MNCs, who control new product technologies, to take over the Indian market and rig drug prices and drug availability at will.

Today, older drugs which have been off patents for some time are costlier than in many developed countries. Only newer drugs, which are still patent-protected are comparatively much cheaper in India. Change in the Indian Patents Act of 1970 would also deny Indian consumers the benefits of new drugs produced in India at affordable prices.²

A major section of Indian industry in the pharmaceuticals sector had opposed a change in the Indian Patents Act of 1970. But today some have changed track and many seem ready to follow suit. They see an opportunity in tying up with MNCs as junior partners to target the huge generics market in the US. While this may provide some immediate benefits to a few Indian companies, in the long run their very survival is at stake as the 'uncaged' MNCs prepare to take over the Indian market once again.

Contrary to the reforms ideology the market does not regulate prices of drugs, as demand primarily depends on prescription habits of doctors, disease profiles, drug resistance, etc. Hence the market cannot ever be a proper mediator of prices of drugs. The oligopolistic nature of the industry, where few companies have monopoly within various therapeutic groups, makes the operation of the market even more infructuous. The present policy of abandoning price and production controls has already led to unjustified rise in prices. The concessions to the foreign sector mark a dangerous shift in our policy framework. These concessions and a possible change in the Indian Patents Act will return the drug industry to the situation prevailing in the 1950s. A situation where MNCs can earn super profits due to their control over technology and brand images.

Notes

1 In this regard the UNICEF in *The Progress of Indian States, 1995*, p 3, is constrained to comment, "Whereas effective policy design requires good data, the Indian data-base on children has several limitations. Basic statistics on several quantifiable indicators relating to morbidity, education, nutritional well-being and so on, are not systematically collected and presented even at the state level. ... However, we believe that in the Indian context, with each year that goes by, this weakness reflects less and less a lack of capacity and more a lack of priority.

On Anthropological Discourse

Carol Upadhyia

I AM writing in response to Meenakshi Thapan's reaction (*EPW*, September 21) to my review of two recent ethnographic texts on rural women in north India (*EPW*, July 20). My intention in that review was not to attack anthropology in general, but to raise questions about certain trends within (mainly American) cultural anthropology through a critique of recent work on India. Since Thapan appears to have misunderstood the basis of this critique, I would like to clarify my position by situating it in the context of recent debates, which I describe briefly (of course, at the risk of over-simplifying the issues and various positions taken). Because it is not possible to spell out any of these arguments in a brief note, I refer below to a number of writers who have taken a similar position.

In response to Thapan's accusation that I have not read Crapanzano, Rabinow or Geertz, I can only say that to know is not necessarily to love. She seems to think that anthropology has been entirely consumed by the 'postmodern' wave represented by these writers (in this context postmodernism itself is a debatable term, but since it has come into common usage to refer to a particular cluster of positions, it seems best not to quibble over terminology). Therefore I would first like to point out that by no means all anthropologists subscribe to either the position articulated by Fischer, Clifford et al, nor to the related subfield of interpretive anthropology whose central figure is Geertz (and it is important to distinguish between the two). Quite to the contrary, postmodernism has given rise to bitter and divisive debates within American anthropology, as it has in other disciplines. Critiques have come mainly from two directions: from traditionalists who believe that cultural anthropology is or should be an empirical science of some sort, and from what may be loosely described as a political economy position. It is primarily from the latter perspective that my own objections arise, and it is mainly the debate between political economy and postmodernism to which I refer below. For the sake of brevity, I leave out the important feminist interventions on these issues.

The postmodern move in anthropology began with the deconstruction of ethnographic writing, which highlighted the literary devices that are used in ethnographic texts to establish the authority of the ethnographer and to obscure his own voice [Clifford and Marcus 1990; Marcus and Fisher 1986]. The critique, which problematised the interpretation and representation of 'other' cultures,

led to experimentation with ethnographic writing aimed at conveying more authentically the multiplicity of discourses found in the field, for example, by representing informants' voices with minimal mediation or by making them joint authors. This in turn gave rise to the stress on 'intersubjectivity', 'multivocality', the dialogical production of knowledge, reflexivity, and so on, which Thapan identifies as the crux of the ethnographic method. According to this position, because anthropological knowledge is produced intersubjectively through a dialogical process between the anthropologist and her informants, there can never be one 'true' knowledge but only numerous 'partial' or 'situated knowledges' (which nonetheless contribute to a "deeper understanding of the whole").

But in what way does this position answer to the problem of the 'construction' of the subjects? As some of the postmodern writers themselves acknowledge, however dialogically and reflexively the anthropologist may write, she remains the author [Rabinow 1990]. Therefore, one needs to ask whose voices really are being projected and to interrogate the way in which the subjects are portrayed in such writing, rather than simply accept the account as someone's 'partial knowledge'. After all, one of the central contributions of the postmodern critique was to show that the ethnographic text is both *constituted* and *constitutive* rather than a simple description and analysis of social reality. In the wake of this deconstruction of ethnographic writing, it is surprising that anyone (especially someone who appears to accept those arguments) could still describe the ethnographer as a "faithful recorder and interpreter ... of social reality". While of course the ethnographer does not 'construct' her subjects in real life, she certainly does so in the text. Nor is this a trivial matter, for ethnographies sometimes do have real life effects in 'producing' their subjects, as for example when they become sources of knowledge on 'traditional' practices [Friedman 1992; Hanson 1989]. In this context (and given the well known relationship between anthropological discourse and colonialism), is there any reason to believe that academic discourses being produced today have no political reverberations beyond the academy [Escobar 1995]?

Another reason why anthropologists now speak of 'dialogics' and often subject their writing to scrutiny by their informants is that the ethical dilemmas of doing fieldwork are

increasing day by day: anthropology's subjects today are often capable of reading what is written about them and of writing back, even to the extent of bringing a lawsuit against the anthropologist [Lee and Ackerman 1994]. But does involving the informants more explicitly in the research or writing process mean that the ethnographic text is produced through a participatory process among equals? Except when the anthropologist, because of her expertise, has been employed by people to perform a specific task (for example, native Americans sometimes hire anthropologists to work on land claim cases), the entire ethnographic exercise is conceived and carried out *by and for* the anthropologist, and its terms of discourse are therefore determined outside of the field situation itself. Although the subjects of course do influence the kind of information the ethnographer is able to acquire, the questions she is asking and the perspective she brings to her work are guided by her own knowledge quest, while the final result, to be acceptable within the academic community, must be couched in a particular kind of language (including, for example, the invocation of concepts such as polyphony, dialogics, resistance, etc), which in turn is determined by various political considerations (academic and otherwise). Although the postmodernists make much of reflexivity, most do not take full account of the power asymmetry between researcher and subjects in real life, as well as that between the knowledge that is produced in the academy and the local knowledges of the subjects.

Thus, as many critics have pointed out, the problem of ethnographic authority has not at all been solved by new methods of writing which attempt to 'de-centre' the ethnographer [Geertz 1988; D Scott 1992]. Rather, these can be seen as tactics which have been deployed to reconstitute the authority of the ethnographer by mystifying the actual processes of knowledge production during fieldwork and appropriating the voices of the subjects [Fox 1991b; Sangren 1988]. Moreover, in spite of its claims to epistemological 'sophistication' the advocates of postmodern ethnography appear to be quite naive about the way in which the narratives collected by the anthropologist are produced. What people are able to say about their own lives is circumscribed by their subject positions within a concrete social formation, which they are not free to determine. The postmodern critique, while highlighting the issue of power in the making of ethnographic texts, for the most part has failed to interrogate the political bases of the multivocality found in the 'field' [Sangren 1988, Scholte 1987, Ulin 1991]. Yet it is the power relations

among those who are producing this intersubjective knowledge (including the anthropologist) that need to be understood if an ethnography is to be truly 'reflexive'.

It was in this context that I made a remark in my review, which Thapan has challenged, about the knowledge that is produced by activists as opposed to academics. An activist or an anthropologist who is politically involved in some way with the people she studies, and whose research is therefore guided to some extent by the people's own expressed interests and desires, is starting from a different subject position than is an academically oriented anthropologist, and therefore produces a different kind of knowledge. But I would go further to argue that this knowledge is not merely different but better: the engaged researcher is more likely to produce a culturally authentic interpretation of the lives and consciousness of the people, to be sensitive to the different discourses produced, and to be able to integrate this understanding into a 'multivocal' analysis which takes into account not only the various 'voices' involved but also their positions within the larger social or political situation [Escobar 1992, Nash 1992]. But while advocating engagement in research, I would not adopt the mainstream feminist strategy, cited by Thapan, of identification with the subjects on the basis of their common oppression as women with the aim of 'giving voice to the voiceless'. This position has long since been criticised by radical black and third world feminists who argue that the former appropriate the lives of poor and non-white women and project a spurious solidarity with them to further their own projects [Caplan 1994].

Thapan objects to my statement that the anthropological tradition views people as "automatons who only reproduce their traditional cultures". Here I was of course referring to the dominant theoretical paradigms which held sway prior to the 1970s or so and not to present-day anthropology, and in writing this I was trying to suggest, perhaps too elliptically, that the practice of anthropology is circumscribed by what came before. The earlier dominant theoretical systems were notoriously empty of concepts of conflict, agency, or power, and their objects of study were cultural or social systems rather than social action. It was precisely because of these shortcomings that both agency and history became central to the theoretical debates of the late 1970s and 1980s [Ortner 1984]. Perhaps because of this background, 'agency' as used by anthropologists tends to be located at the level of the individual who acts against a given 'structure', and it is usually conceptualised in its most limited sense as conscious, intentional action. Because most cultural anthropologists remain concerned

with the micro-processes of social life, their recent discovery of agency and history ironically has not resulted in the development of a concept of historical agency.

Another recent trend in anthropology to which I alluded critically in my review was the postmodern version of the culture concept. The older view of culture as a unified and bounded system of symbols and meanings has been replaced by a concept of culture as a multiplicity of discourses which are constantly being contested and negotiated – a formulation that has been nicely debunked by Friedman (1992:852) – as coming from modernist identity spaces dominant in the metropolitan countries: "Culture is supremely negotiable for professional culture experts, but for those whose identity depends upon a particular configuration this is not the case. Identity is not negotiable. Otherwise, it has no existence". In addition, the conventional idea that a common culture or value system is the cement of social groups has been replaced by a Foucaultian notion of power. While these critical moves have been positive to the extent that they have exposed the weaknesses of standard social theory, the overall outcome has been somewhat less so. The upshot has been a 'discursive turn' in cultural anthropology, or what David Scott (1992) calls an 'inflation of culture': an overriding concern with representations, discourses and texts (and with culture as text), the goal being to discover the multivarious ways in which people understand and represent their worlds. Of course, anthropology has always dealt with such questions; the difference now is that there is hardly any attempt to relate cultural forms to anything else, nor to investigate their historical bases. Because social life is seen as discursively constructed, the task of the anthropologist is to deconstruct received categories of social analysis (gender, class, politics) and to explore how people 'construct' their cultures or have their identities constructed for them (usually by an amorphous Foucaultian 'power').

The recent spate of 'resistance' studies partakes of these theoretical tendencies in cultural anthropology. In my review I was not questioning the value of studying relations of domination and modes of resistance *per se*, as Thapan suggests, but was trying to point out that there is a real problem with the ways in which these concepts are being utilised in the recent literature. Although Thapan refers in the same breath to a diverse group of writers who have employed the concept of resistance, there is a very big difference between this recent genre and the earlier work which is often cited: that of Gramsci, Raymond Williams and the British cultural studies school, and social historians such as E P Thompson and

Genovese, all of whom analysed in great detail (but in different ways) the complexity of cultural hegemony and resistance as historical processes. No doubt, several excellent studies of resistance have been produced, including by anthropological, but I would not include among them most of the anthropological literature in which resistance is located mainly in the realm of discourse, ritual and cultural traditions.

The shortcomings of resistance studies can be traced to their two main theoretical sources: Foucault and James Scott. Because the concept of power employed in 'new age cultural anthropology' [Knauff 1994] is derived from Foucault, it is treated mainly as a discursive or linguistic category, divorced from the social processes or institutions which produce it as well as from the people (individual or collective) who wield it. As many critics have pointed out, there is no room here for agency: the subject is produced by power, not vice versa, and in fact power itself assumes the status of a subject [Sangren 1995: 9]. Some writers have attempted to recover the subject by searching for sites of resistance, but the result in most cases has been an equally disembodied and mystical notion of resistance as power's 'other' [Ahmad 1991, Sangren 1995]. In this search, many have turned to the work of James Scott (1985, 1990), who locates resistance in its 'everyday' and less obvious forms: speech, expressive traditions, small demonstrations of defiance – the 'hidden transcripts' which the oppressed always produce in opposition to the public discourses of power. But instead of engaging in a concrete analysis of the class or political order through which relations of domination are produced, Scott (1990) constructs two reified megacategories, the 'subordinate' and the 'dominant', which appear to be the same everywhere and at all times [Brass 1991; Ortner 1995].

Anthropological studies which draw on these works and locate resistance in cultural expressions of dissension or 'alternative discourses' have been widely attacked for their romanticism and for collapsing together different kinds of resistance. By interpreting all manner of things as resistance, from songs to petty theft, there is an inclination to view systems of power as ineffective [Abu-Lughod 1990]. Another weakness of such studies is that their focus on face-to-face interaction and language use is inadequate to the task: relations of domination and resistance, as well as the subjectivities of the participants, are mediated or constituted by larger and diverse processes originating outside of the immediate situation [Gal 1995]. Moreover, this literature tends to ignore the strength of hegemony, unlike earlier writers such as Willis (1977), who showed that the development of a counter-culture among working class youth does not necessarily

lead to a radical consciousness but may only reinforce class status. But most troubling is the tendency to trivialise the degradation experienced by subordinated groups by stressing their 'cultures' of resistance and the maintenance of social identity even under conditions of extreme exploitation [Rebel 1989: 117]. It seems to me that a more careful exposition of what is meant by both power and resistance is required. One way to concretise these concepts would be through the study of social movements, which have not received much recent attention from anthropologists in spite of their new-found interest in resistance [Escobar 1992].

In conclusion, I would like to acknowledge that the postmodern move in anthropology has been extremely important in foregrounding the symbolic or cultural foundations of power – elements which were lacking in earlier anthropologies as well as in much of political economy. However, because it identifies representation as the key to reflexivity and the 'small narratives of ethnography' as the basis for cultural critique [Ulin 1991: 67], postmodernism has not lived up to its promise of developing a critical anthropology. The most fundamental problem with much of the new cultural anthropology is that it is unable to theorise the historical constitution of subjects and thus cannot adequately connect its concern with cultural meanings to larger questions of social or political transformation. From the political economy perspective, the postmodernist writers accord too much autonomy to culture and representations, disconnecting the production and power of discourses from their social and historical meanings. Political economists insist that culture, far from being an autonomous 'web of meanings', is implicated in the production of social relations of dominance and subordination as *both* outcome and instrument. Rejecting the postmodern view of cultural phenomena as inherently fragmented, they argue for the need to discover their underlying coherence by understanding culture as historically produced by human agents [Fox 1991b, Roseberry 1982, Scholte 1986]. But it would be mistaken to presume that political economists simply want to resurrect a base-superstructure theory of ideology; they recognise the need to integrate the concerns of cultural anthropology with those of political economy, but argue that the hermeneutical programme of both Geertz and the postmodernists is ill-suited to their project [Rebel 1989].

Critics in the political economy camp also point out that postmodernism has failed to turn its concern with power/knowledge back on itself by interrogating either the concrete social conditions that shape its own practices, or their political implications. Because

anthropologists neither own nor control the means of their scholarly production, as Fox (1991a:9) puts it, anthropology must be continuously recalled "...both to its own history ... and to the specific contemporary historical conditions that establish the institutional and discursive space of its thematic and theoretical formulations" [Scott 1992:373]. Besides developing a critique of anthropological discourse, it may be time to give up the mystical idea of cultural critique via the representation of 'difference' and to develop instead a kind of ethnography that is truly dialogical – one that recognises the discursive positioning of all the participants in the process and allows the direction of the research to be determined by the people rather than the researcher's own ambitions. I agree with Escobar (1992: 419) that if anthropology truly wants to de-authorise itself and its 'modern' knowledge practices, it needs to "...move away from the organisation of knowledge in which it exists – abstract, disembodied, and disembedded from popular social contexts, accountable primarily to the academy – and start to participate more explicitly in local questions and activities". By absorbing uncritically the dominant academic discourses of the day, many anthropologists appear to be moving in the opposite direction.

UTI's MONTHLY INCOME PLAN '96-IV

15% p.a. Minimum
Targeted Dividend
(16.08% Annualised Yield)

- ✓ Regular Monthly Income
- ✓ Easy Liquidity
- ✓ Safety
- ✓ Scope for Capital Appreciation

F E A T U R E S

- ♦ Close ended 5-year plan with 2 options.
- ♦ **MONTHLY INCOME OPTION :** 15% p.a. minimum targeted dividend payable monthly for the first year. Dividend for the subsequent years will be announced before the end of the preceding year and sent in advance.
- ♦ **CAPITAL GROWTH OPTION :** Income earned will be ploughed back to give capital growth.
- ♦ Repurchase facility after six months at NAV-based price.
- ♦ Minimum investment Rs. 2000/-. No maximum limit.
- ♦ Benefits under Section 80L, 48 and 112 of the IT Act 1961.
- ♦ Tax Deduction at Source as per the IT Act 1961.
- ♦ Applications received up to 15th of the month shall get full dividend for that month, while those received after the 15th shall get dividend for half the month.

PLAN CLOSES : 14th DEC.'96

UNIT TRUST OF INDIA
For your better tomorrow

Risk Factors: All investments in mutual funds and securities are subject to market risks and the NAV of schemes may go up or down depending upon the factors and forces affecting securities market. Past performance is not necessarily indicative of future results. Monthly Income Plan '96-IV, a Plan launched under Growing Monthly Income Unit Scheme '91, is only the name of the Plan and does not in any manner indicate either the quality of Plan, its future prospects or returns. There can be no assurance that the Plan's objective will be achieved. In the event of actual income not being sufficient to pay minimum targeted returns of 15% p.a. members may suffer loss of unit capital to that extent. Please read the offer document before investing.

new directions.
But our focus
remains the same.**

YOU

The customer always comes first at Indianoil.
In everything we do. Whether it is improving facilities at our retail outlets (part of our Vision 2000).
Or our TQM effort, which has already seen over 30 IOC units earning the ISO 9001/9002 accreditation. Or, our vertical integration programme – from exploration & production to power generation and petrochemicals.
And technology upgradation. And infrastructure development ... the list is endless.

During the last year, our six refineries achieved over 105% capacity utilisation. The pipeline network registered the highest ever throughput.
Not to mention a 9.9% increase in sales to 39.9 million tonnes.

All this translates into just one thing.
Better service for you.

**AUDITED FINANCIAL RESULTS FOR
THE YEAR ENDED 31ST MARCH, 1996. (Rs./Crores)**

	YEAR ENDED 31ST MARCH '96	YEAR ENDED 31ST MARCH '95
1. Income from Sales and Operation	46,416.82	38,340.30 *
2. Other Income	190.12	172.75
3. Total Expenditure	44,127.53	36,500.88 *
4. Interest (Net)	154.57	225.05
5. Gross Profit after Interest but before Depreciation and Taxation (1+2-3-4)	2,324.84	1,787.12
6. Depreciation	559.51	417.28

Vol XXXI No 49

December 1996

Industrial Productivity: Disaggregated View

Attempts at measuring manufacturing productivity in India have generally operated at a high level of aggregation involving manufacturing as a whole. But the *Annual Survey of Industries*, their common source of data, reveals pronounced variations within organised manufacturing in respect of wage rates, profit rates and techniques which demand a disaggregated analysis of productivity to the extent feasible. An attempt to study productivity trends in Indian industry dividing manufacturing into sub-sectors by the criteria of ownership (public versus private) and enterprise size (small versus large) and to provide a revised index of productivity in Indian manufacturing by aggregating the disaggregated productivity measures. **3177**

Retrieving a Feminist Image

Anandibai Joshee was the first Maharashtrian woman to leave Indian shores in the latter half of the 19th century for higher studies abroad to become the first Indian woman to qualify as a medical doctor. The Maharashtrian psyche remains captivated by the image of Anandibai as a submissive girl-wife who fulfilled her husband's visionary ambition for her. However, the series of images sketched by Anandibai's own words produce a self-portrait in which the submissive wife coexists with an intelligent woman dispassionately perceptive of herself and her society. An attempt to reach the 'real' Anandibai and to reclaim her fragmented feminism. **3189**

Burying Handlooms

The 1985 National Textile Policy, by treating productivity and efficiency as the priority concerns, removed hitherto existing restrictions on mills and powerlooms meant to protect the large-scale employment, actual and potential, in the vulnerable handloom sector. What has been the impact of the policy on the handloom industry? **3198**

In Troubled Waters

The Shiv Sena-BJP alliance in Maharashtra is in trouble, having to contend with Anna Hazare's allegations of large-scale corruption by its ministers, the judicial strictures on its conduct in the Enron renegotiation and the resentment at the Sena chief's ill-considered attack on one of the Maharashtrian middle class's literary icons. While these developments have shaken the ruling coalition, there is no political force in the state which can channel the popular discontent. **3159**

The 'Transition'

By enshrining separation of powers, individual liberties and rights of private property and entrepreneurship, Ukraine's new constitution eliminates the last vestiges of the years of communist power. **3167**

Without Water

If rural water supply programmes are to be effectively implemented, greater participation by the local people, especially women, is imperative. An evaluation of water supply schemes in eight districts of eastern UP. **3163**

Holes in the Net

With few industries taking skill upgradation seriously and the amounts paid under voluntary retirement schemes getting rapidly exhausted in consumption, the National Renewal Fund has not provided much of a safety net for workers. **3165**

Foreign Funds and NGOs

The Foreign Contribution Regulation Act which regulates the very substantial flow of foreign funds to the voluntary sector needs to be amended urgently to prevent misuse of the funds and secure a measure of accountability on the part of the NGOs. **3161**

Regional Co-operation

While the European Union can never serve as a simple model and blueprint to be transposed and imitated at will, the countries of south Asia can derive from its evolution some general insights into the possibilities and problems of construction of supra-national institutions and alliances by sovereign states. **3169**

Appeal to Commute Death Sentence

TWO dalit youths, Chalapathi and Vijayavardhana Rao of Guntur district in Andhra Pradesh, are currently in death row and are likely to be hanged to death on December 18. The warrant has been issued by the sessions court, Guntur. At the same time, a mercy petition for commutation of the death sentence to life imprisonment is pending before the president of India. Earlier, the Andhra Pradesh High Court and the Supreme Court of India had rejected the appeals and hence the mercy petition before the president.

The two accused had, on March 7, 1993, attempted to rob the passengers of an APSRTC bus which was en route to Chilakaluripeta from Hyderabad. Their *modus operandi*, as it appears, was to pour petrol across the length of the bus, and at knife point force the passengers to part with their money and valuables. In the execution of their act however, according to the accused, one of them accidentally set fire to the bus. Though in course of the trial the accused contended that they were not guilty of this crime, they appear to have changed their stand subsequently. They presently plead that only robbery was their motive but not the killings, and the accidental burning of the bus, mentioned earlier.

Chalapathi and Vijayavardhana Rao who are in their early 20s have no prior criminal record. They are the dalit urban poor having had to eke out a perilous livelihood and a miserable socio-economic and cultural existence. It is possible that chronic poverty drove them to commit this desperate crime. Their caste and class status is indeed a vital social if not legal evidence to be taken into account. Secondly, their averment of not having had any intention of setting the bus on fire and therefore the possibility that it could have been an accident. It is patent that they deeply regret the incident.

A remarkable fact is that in the present case the judicial process has been seemingly fast, the whole process of trial having been completed in a span of four months. This swiftness can also be attributed to the fact that being poor and defenceless the two accused could not take recourse to dilatory tactics so common among lawbreakers today, could not have access to ingenious legal talent, could not have access either to police officials or politicians, witnesses were under no compulsion not to testify. In short, the caste and class realities have been important dimensions in this trial.

Politicians having engineered and executed communal riots and the like, whose criminality has been proved, are yet to be brought to book. The communal riots of Hyderabad is an example of politically motivated and organised murder of hundreds of Muslims. Even where the courts have given their verdicts, a woman like Roop Kanwar who was burnt alive publicly could not get justice due to 'lack of evidence'. Bhanwari Devi was told by our judiciary that "upper caste men will not rape lower caste women". Caste, class, gender and communal politics has always mediated the nebulous zone between crime and punishment. Chalapathi and Vijayavardhana's case seems to be no exception to this general trend.

Yet another important dimension underlying this specific case is the essential philosophical and jurisprudential question of the rightness, relevance and efficacy of capital punishment. The debate still rages on with no conclusion in sight. However, the Supreme Court laid down the principle of 'rarest of the rare' in the awarding of the capital punishment. According to this principle only the rarest of the rare crimes invited the death sentence after having duly exhausted all other alternatives. Does this case fall within the parameter mentioned above is a question being posed by civil liberties groups. This is in addition to the basic question of the sustainability of capital punishment in the penal system as such. Moreover, historically the high courts and the Supreme Court have on umpteen occasions as courts of appeal regularly commuted death sentences awarded by lower courts. In the process a convention has been seemingly established of awarding a death sentence more as an exception than as a rule. (It should also be mentioned that Andhra Pradesh has not had a single death sentence in the last 17 years.) If so, could not the present case come under the ambit of the convention is another question?

We urge all civil liberties, dalit, women's groups and concerned individuals to write to the president of India asking that the death sentence be commuted to life imprisonment. Since there is not much time as December 18 is just a few days away, we request you to immediately intervene in the media by issuing statements, protest letters and also mobilise public opinion against the death sentence. Otherwise the system seems determined to do away with two hapless dalits.

SUJAYA
Chalapathi Rao and Vijayavardhana Rao's
Death Sentence Commutation
Committee,
Hyderabad.

Money Market: Mauritian Parallel

MONEY Market Review (September 28) deserves high appreciation for its robust analysis of data. Some readers in Mauritius wanted to draw a parallel picture for Mauritius.

The central bank released substantial banks' cash reserves in July 1996 in the spirit of strengthening the use of indirect instruments of monetary control. It was also implicitly expected that banks' interest rates would come down to a level which is reasonable to boost real sector and consequently financial sector (particularly the baby stock market). The current situation is that banks are in a race to convert additional liquidity into government securities and also into foreign currency. The first conversion is not so damaging so far as the central bank's perception regarding current excess liquidity is concerned. But the second conversion is causing some damage as it is adding fuel to the fire of depreciation of rupee caused by international trends. The issue of bringing down interest rates through the pumping of significant amount of liquidity seems to be an academic one here too. Non-resident deposit rates and financial liberalisation are cited to explain high interest rates as well as its lack of responsiveness to availability of funds.

Bankers think that financial liberalisation has made them more concerned about the quality of credit, not the amount of credit. Therefore, banks in general are reluctant to lend whenever creditworthiness is in doubt. The growth in demand for quality credit is lagging, so excess supply is not felt in the credit market and lending rates remain sticky. If the quality of credit is compromised, the additional funds are certain to bring about a notable reduction in overall lending rates.

The fact should be recognised that banks are willing to provide personal and trade credit in order to avoid credit risk and also to earn more, instead of providing credit to (risky) production-related activities at a low cost.

This situation however does not warrant the authorities reimposing direct interest rate regulations. The trade-off between the quality of credit and the cost of credit should be analysed properly.

To conclude, when the market is slow and inactive to bring correction, policy should meet the gap with least use of fiat.

T K CHAKRABARTY
Mauritius

One More Paper Exercise

THE Planning Commission has apparently learnt nothing from past experience. Its *Approach Paper* for the Ninth Plan (1997-98 to 2001-02) harps on the same time-worn, mechanical Harrod-Domar type of macro-economic relationships and, based on them, presents alternative GDP growth targets together with estimates of the required saving and investment rates and implicit incremental capital-output ratio. The document, just like the ones prepared for the earlier plans, fails to present a plan-frame linking the plan programmes and targets to policies and institutional apparatuses. If the Planning Commission believes that the incorporation of impressive numbers of overall and sectoral growth into the Ninth Plan will revive popular faith in planning in the face of the onslaught of liberalisation and globalisation, it is sadly mistaken. What the Commission needed to do, and what it has not done, was to engage in a critical reassessment of its role in the context of the vastly changed national and international economic environment and set out a path of development more relevant to the needs and capabilities of this country than that being sought to be forcibly imposed by the so-called economic reformers. The Commission, it is well known, was assigned no role in the shaping of the economic reforms dictated by the stabilisation and structural adjustment programmes of the IMF and the World Bank. What was worse, given the actual record of the type of economic planning pursued in the country, no one seemed to seriously mind this complete marginalisation of the Planning Commission during the Narasimha Rao-Manmohan Singh regime. The Commission's own response, despite all the sound arguments for holding that our particular brand of reforms hinged to free markets, free trade, stable money and globalisation were likely, at this stage of the country's development, to aggravate the accumulated problems of poverty, unemployment, rural-urban, inter-regional and inter-class disparities and even technological backwardness, was thoroughly spineless. The 'discussion paper' it prepared in early 1994 in effect cut the ground from under economic planning by its mealy-mouthed assertion that "in the absence of a free market the system becomes blind to costs and efficiency and leads to enormous wastage of resources and ultimately in the wasting of growth potential". It was instead content to seek a role for itself in terms of proposing certain socially desirable objectives in an essentially market-driven economic set-up. This is, of course, what the Commission has been doing from the very beginning; what has been missing is a role for it in working out how the desired social goals were in fact to be achieved. The Commission's planning exercises by and large remained an academic activity even as different government departments,

at the centre and in the states, went about making and implementing economic policies generally unconcerned about their macro-economic implications.

The new Planning Commission has failed even more glaringly to face up to the challenge before it in the current dispensation. Curiously enough, one expression of the challenge has come from one of the Commission's own members who has chosen to go on record with the assertion that "the first priority of planning in India today would be to complete the unfinished task of economic reforms". The member concerned has questioned the very basis of so-called target-oriented planning for investment allocation over a five-year period. Doubting that there is any relationship between the size of investment and the growth of output, he has expressed misgivings about the usefulness of any notion of the size of plan outlay for a period of five years. There was also no point in seeking the commitment of the finance ministry or the state governments on the size of the five-year plan outlay since no credible commitment could be given by them for so long a period. This member at least wants the Planning Commission to turn its efforts to planning for policies in a market economy, to move away from macro-economic to micro-economic planning with the emphasis on development of agriculture, infrastructure and social sectors through flexible annual plans.

The Planning Commission has failed to confront these positions, though taken as a whole they could be said to come quite close to demanding an end to the whole planning exercise. Instead, in its *Approach Paper*, it has once again put on public display the yawning gap between the Plan's physical targets and the policy instruments for achieving them. In the process it has in effect conceded the economic reformers' central contention that there is no link between planning and the growth of the economy. Goaded by the prime minister, the Commission has concocted visions of 7 per cent annual growth of GDP, comprising 3.5 per cent growth of agriculture and 9.3 per cent growth of industry. The *Approach* document wants it to be believed that its sectoral and overall growth targets are consistent with a fiscal deficit of 4 per cent of GDP, a domestic saving rate of 26.2 per cent, a current account deficit of 2.3-2.4 per cent, an investment rate of 28.6 per cent and an incremental capital-output ratio of 4.1. Even on this aggregative plane what stands out is the absence of any policy-frame for raising the saving propensity of the community, since a lacklustre rate of domestic saving has been an ever-present and particularly intractable hurdle to sustained high growth of the economy in the past. This is particularly relevant just now since, under the spell of liberalisation, all aspects of

macro-economic policies are geared to boosting consumption by the middle classes and the rich. The average gross domestic saving rate for the three-year period 1988-89 to 1990-91 was 22.5 per cent and it may have been around 22.8 per cent in the last three years from 1993-1994 to 1995-96. With the base-line estimate of 24 per cent for 1996-97 used for the Approach document's Ninth Plan exercises, the projection of a saving rate of 26.2 per cent for the Plan's terminal year, implying an incremental saving ratio of over 30 per cent, is on the optimistic side. There is nothing in the Planning Commission's thinking, as revealed in the *Approach Paper*, which would go to correct the present pro-consumption bias and raise the economy's savings base.

The Planning Commission's fiscal objectives likewise cannot be achieved as tax reforms have already significantly eroded budgetary resources. Given the committed non-development expenditure on interest payments, subsidies, defence and the administration, taking into account also the implications of the recommendations of the Fifth Pay Commission for government employees, no significant improvement can be expected in the current situation of dissaving by the government administration. This is, of course, the reason why the finance ministry is unwilling to commit itself to the high level of budgetary support of Rs 3,70,000 crore – compared to the initially expected level of Rs 2,80,000 crore – to make possible a public sector outlay of Rs 8,00,000 crore in the Ninth Plan. The additional budgetary support is being sought for financing larger public sector outlay on infrastructure, as it is abundantly clear by now that the economic reformers' expectations of private sector investment, including by MNCs, on infrastructure areas will turn out to have been pipedreams. In the absence of a substantial improvement in domestic saving, the economy's potential for absorbing either higher private sector investment or foreign direct investment of the projected order of \$ 10 bn per year or anything remotely approaching that can be easily written off.

The mismatch between targets and policies and instruments is notable also in the nine-point goals set for the Plan, all supposedly reflecting the highest priority accorded by the Planning Commission to the generation of productive employment and eradication of poverty. Apart from unexceptionable, and equally meaningless, statements about accelerating economic growth at stable prices and strengthening efforts towards self-reliance, the nine-point programme encompasses food and nutritional security for vulnerable sections, safe-drinking water, primary health, universal primary education, shelter and road links, containing population

growth, empowerment of women and socially disadvantaged groups and promotion of panchayat raj institutions, self-help groups and co-operatives. All of these objectives were enshrined in the earlier plans as well. But one of the more important lessons of our recent experience is that we cannot make do with low savings and expect to achieve high industrial growth on the strength of the consumption propensities of the rich and middle classes and at the same time hope to make significant improvements in the socio-economic conditions of the poor in the above manner. For one thing, the high GDP growth target of 7 per cent and industrial growth of 9.3 per cent imply a certain investment strategy which would have significant opportunity costs in terms of starving the social sectors of the required attention and financial resources. For another, the Planning Commission has no suggestions for improving the organisational and institutional capability of public administration to actually deliver these social services to the poor in an efficient and effective manner.

POLITICS

Pushed into a Corner

IN its desperate bid to keep the United Front government in power, the Left appears to give in to pressures from all quarters. First, it was home minister Indrajit Gupta who had to eat his words after the Congress Party objected to his critical remarks about it. He has now been virtually reduced to a non-entity in the cabinet, with the prime minister rarely consulting him even on decisions involving his ministry. Now it is the turn of the CPI(M) leader Harkishen Singh Surjeet to bow under pressures from the World Bank, sweetened by the suave presentation made by finance minister P Chidambaram at the recent meeting of the Steering Committee of the United Front.

The Left representatives, along with Surjeet, were so overwhelmed by Chidambaram's statistics and assurances, that without batting an eyelid they agreed to his proposal to privatise the insurance sector and disinvestment of public sector units (PSUs) shares up to 74 per cent. In exchange, they got the sop of a revamped public distribution system (PDS) that would give wheat and grain at half the issue price to people living below the poverty line. It apparently never occurred to the Left leaders attending the meeting to question whether the PDS reached the remotest villages – in the poorest tribal districts or the drought-hit areas of Orissa where people are dying of starvation – and people who can never afford to buy foodgrains even if the prices are reduced by half. The prompt acceptance of Chidambaram's promise on PDS by the Left

indicates the growing alienation of the Left leaders from the ground reality – an alienation which leads to the sort of gullibility that one discerns in the behaviour of Communist ministers and politicians, the former depending on the advice of dyed-in-the-wool bureaucrats and the latter swayed by the rhetoric of Harvard-educated or World Bank-trained 'experts'.

The composition of the United Front government being what it is – a mishmash of hitherto unknown regional leaders suddenly propelled on the national scene, a few veterans from the past Left movement still trying to adhere to their socialist commitments, and two ministers holding the major portfolios of finance and industry totally wedded to the World Bank programme of opening up of the Indian economy to foreign multinationals and privatisation – what else can one expect from those in the Left who are a part of the United Front government (like the CPI) or those who are supporting it from outside (like the CPI(M))? In the uncomfortable political equations within such a United Front, the Left, if it is still loyal to its ideology, should find itself an alien. But it is trying to keep up the *bonhomie* with its partners and in the process it is giving up, one by one, its commitments not only to its electoral constituency but also to its followers in the trade union fronts.

Following the Left's acceptance of Chidambaram's proposals, rumblings have emerged in both the CPI's trade union front, AITUC and the CPI(M)-run CITU. They are opposing tooth and nail the proposals for the privatisation of the insurance sector and disinvestment in public sector units and are planning to chalk out a programme of direct action against these proposals in early December.

The Left will thus face an unenviable situation of being forced to confront its own constituency in the trade union movement. The trade unions, nurtured by the Left all these years in the public sector, have their stakes in its continuation. The stakes are not only the ideological issue of traditional Leftist support of nationalisation of major sectors of the economy, but also the privileges and perks that employees in the PSUs have been enjoying all these years.

KARNATAKA

Shifting Sands

WHEN J H Patel took over as chief minister, it was generally believed that Deve Gowda, the outgoing chief minister, was installing a compromise candidate, who was the best choice at that time. After all Patel, it must be remembered, was a nominee of Ramakrishna Hegde and he was accepted by

Gowda over the other more favoured candidates, all vokkaligas. At that point of time, with Hegde obviously miffed at Gowda being chosen as the United Front's candidate for the prime ministership, it was necessary to appease him to keep any turbulence in the state Janata Dal in check. And with Hegde's exit from the party it became even more important that any rumblings within the party be quietened and no new tensions be allowed to be articulated. Patel used these developments skilfully to keep control over party affairs in the state, despite provocative interference by the prime minister. In the last month, however, the political equation in Karnataka has changed somewhat, making Patel more vulnerable to Deve Gowda's manipulations.

For one thing, Hegde is no longer a factor in the power play. His Rashtriya Navnirman Nagarik Samiti has all but fizzled out. It could secure only three out of the 100 seats it contested in the Bangalore civic elections. Nor has it been able to make much headway through the assembly by-elections where it attempted to selectively support candidates regardless of party affiliations. It supported two BJP candidates, one BJP-supported independent, a Karnataka Congress candidate and even a Janata Dal candidate (reportedly because he had been picked by a Hegde supporter within the party). So Hegde can no longer be deemed a threat to Gowda or the Janata Dal. It is true that the Janata Dal has not done too well in the civic elections and the assembly by-elections. It secured only four of the eight assembly seats, losing in the vokkaliga stronghold KR Pet (much to Gowda's discomfiture) and Gudluggudd to BJP and rebel Dal candidates, respectively. It secured only 19 seats in the Bangalore civic body whereas it had controlled the corporation the last time. It has nevertheless emerged as the single largest party. But in other cities it has suffered heavily.

However, it is not as if there is any other party, either the BJP or the Congress(I), which has been able to pose a challenge to the Janata Dal. Although the BJP was able to emerge as the second largest party in the Bangalore corporation, this fell far short of the party's expectations. Nor was it able to register any significant victories in any other city. In the assembly by-elections too, apart from wresting the prestigious KR Pet seat from the Janata Dal, it could win only one other seat, Bhatkal in south Karnataka, where its margin of victory was considerably reduced. However, the party's candidates, both winners and losers, have been able to secure a larger proportion of the vote than earlier, strengthening the view that BJP's efforts to capture the south should not be written off, not yet. The Congress(I) did not win in a single assembly constituency, nor does its urban profile appear well defined.

The stage is thus set for dissidence in the Janata Dal to bloom. And so it seems to be doing. Supported apparently by Gowda, the dissidents have demanded an immediate convening of the state legislature party. By publicly and disarmingly declaring that he had no objection to that, Patel has for the moment taken the wind out of the dissidents' sail. They had more to gain from a long-drawn-out campaign to pressurise a reluctant Patel to convene the meeting.

PDS

Where Is the Food?

FOR sheer irresponsibility it will be difficult to improve upon the announcement by the union minister for food and civil supplies in Ranchi on November 27 that all hurdles in the way of the new public distribution system, under which foodgrains are to be made available to those below the poverty line at half the normal PDS issue prices, had now been removed and that the scheme would be launched from January 26 next year. The scheme, it will be recalled, is a part of the UF's common minimum programme and the prime minister had announced in his independence day address that it would be introduced from October 2. How typically hasty and ill considered the announcement had been became clear once attention was paid to the problems of implementing the scheme. Esoteric theoretical misgivings about the advisability of targeting subsidies and practical concerns about leakage of subsidies to the undeserving non-poor apart, the really daunting consideration, of course, was that if even a fair proportion, not to speak of all, of those below the poverty line were to be covered under the scheme the quantum of foodgrains to be released through the PDS would shoot up with a more than proportionate rise in the food subsidy, given the commitment to supply foodgrains to the poor at a fraction of the normal PDS prices. Clearly this factor alone – not to mention other hurdles such as that over large parts of the country, especially in states with the largest proportion of the poor, the essential infrastructure for the PDS is virtually non-existent – was enough of a guarantee that the scheme would remain a talking point, a symbol of the UF government's concern for the poor, but would never be introduced with any seriousness. The dismal fate of the so-called revamped public distribution system announced by the Narasimha Rao government is a conclusive pointer in this regard, even though its objective was the much more modest one of supplying foodgrains in areas of heavy concentration of scheduled tribe populations at prices just 10 per cent below the normal PDS prices.

These considerations have been known all along, but what the food minister was deliberately ignoring when he made his statement on the new PDS was that since the time when the scheme was thought of, in howsoever hare-brained a fashion, the foodgrain availability situation in the country has changed dramatically. Reflecting the shortfall in production last year, prices of wheat, and of foodgrains generally, have been rising sharply. The wholesale price index for primary food articles on November 9 showed a rise of 2.4 per cent over just one month. Expectedly, this has led to an increase in the offtake of foodgrains under the PDS, because of the widened difference between PDS and open market prices. The government has also directed the Food Corporation of India to increase its open market sales of wheat to dampen the rise in market prices. As a result it is expected that, from a situation of the PDS being burdened by excess foodgrain stocks, the stock of wheat in the central pool will fall a million tonnes below the minimum buffer stock norm of 3.7 mn tonnes by April next year. So where are the foodgrains for the new PDS for those below the poverty line to come from?

But why should Devendra Prasad Yadav allow such inconvenient considerations to interfere with his public pronouncements? He is the union food and civil supplies minister after all.

JANATA DAL

In a Shambles

THOUGH the 150-odd Janata Dal (JD) senior leaders had gathered at the party's two-day national camp at Surajkund to settle organisational issues, problems which the Congress and the United Front (UF) allies featured more prominently in their discussion than intra-party matters. This was expected since Laloo Prasad Yadav, the only leader able to stand up to Deve Gowda, is on the defensive as his government faces serious charges of corruption in Bihar. With the Left allies distancing themselves from him in his state, Laloo Prasad has been left with little option other than playing second fiddle to Gowda. Yet Laloo Prasad had his pot-shots at his Left allies, indicating that in spite of the growing threat from the BJP-Samata Party alliance in Bihar, he is not in a conciliatory mood.

Gowda too has been at the receiving end of criticism from his allies. Yet unlike Laloo Prasad, he can ill-afford to nonchalantly dismiss them. Heading a 13-party government, without the JD having a dominant presence in it, he is in no position to bulldoze his way through. Gowda has been successful in roping in Ajit Singh and Farooq Abdullah into the UF. But his attempts with the Gujarat

chief minister Shankersinh Waghela and Arunachal chief minister Apang have been frowned upon by his Left partners. The Gowda government's decision to form a separate state of Uttarakhand still rankles with the CPI(M) as it has resulted in reviving the demand for Gorkhaland in West Bengal. The Left parties have also been quick to point out what they consider as 'deviance' from the common minimum programme and have been mounting pressure on the eve of UF co-ordination committee or steering committee meetings. The TMC and the DMK, the two constituents of the UF from Tamil Nadu, have expressed their displeasure at Gowda's talks with Jayalalitha and are also suspicious of a bias in favour of Karnataka on the Cauvery water dispute. The TDP in Andhra Pradesh also harbours a similar suspicion about Gowda ever since the Almati dam row. Andhra Pradesh chief minister Chandrababu Naidu's belligerence has also grown with the tardiness of the central government in disbursing relief assistance to the state.

Gowda's advice to his party workers to be tolerant of criticisms also stems from the fact that none of the UF constituents, in spite of their incessant grumbling, can dare to attempt to topple the government. The threat of the BJP is strong enough to rein them in. Rather it is the happenings in the Congress that are far more crucial to the survival of the UF government. With the change of guard in the party and the call for unity given by Sitaram Kesri, the splinter groups, by rejoining, can bolster the Congress position. Already, since Kesri's nomination, the Congress has become a vociferous critic of the UF government's economic, foreign and defence policies. That also explains why, in spite of home minister Indrajit Gupta's grouse that he is hardly consulted, prime minister Deve Gowda deems it more important to have formal and regular consultations with the new Congress president, Sitaram Kesri.

PAKISTAN

Self-Inflicted Wound

WHEN president Farooq Leghari dismissed the three-year-old Benazir Bhutto government on November 5, there would have been few among the general public who would have questioned the president's charge that the government's functioning had ground to a virtual halt because of the large-scale corruption and there was danger of the situation deteriorating further. Benazir's increasing compulsion to sideline parliamentary debate on the issue – the last involving her husband's alleged investment in properties in England – had created even among her party members increasing

disgruntlement. What was at issue, however, was the constitutional validity of dismissing a government on such grounds, which were unproven. Not surprisingly, this is in fact what Bhutto has chosen to emphasise in her petition to the Supreme Court which, twice refused admission because of the intemperate language used against the president, is now awaiting hearing. Bhutto has claimed that she is in fact *de jure* prime minister on the basis of the Supreme Court's decision on a similar petition of Nawaz Sharif in 1993.

Leghari, the astute politician he is, has taken advantage of the general discontent about the very visible inefficiencies of the Bhutto government, especially on two issues – the ethnic turmoil in Sindh especially affecting the prosperous commercial gateway city of Karachi and the tensions around the murder of Murtaza Bhutto – as well as the increasing and blatantly corrupt deals and practices of Benazir Bhutto and her husband. However, it is conceivable that there were other more pressing factors at work. There are sufficient indicators that the army, a leading player in Pakistani politics, had been increasingly disturbed by the spiralling ethnic violence and its inability to take control, especially in the context of Bhutto's recent ambiguity in dealing with the armed forces, while apparently drawing closer to the fundamentalist interests. It is also a fact that Pakistan's current debt situation and its relations with the US are such that their influence on political events can hardly be ruled out. While the army's role in Bhutto's dismissal is being much discussed especially in the media outside Pakistan, it is clear now that Leghari and the interim government will do their best to make sure of the constitutional validity of the dismissal and the formation of a new government. The

president has taken special care in all his pronouncements to portray himself and the interim government as not necessarily anti-Bhutto but only anti-corruption and having only the country's best interests at heart. The interim government has acted swiftly to set up an Anti-Corruption Commission headed by a retired Supreme Court judge under the newly passed Anti-Corruption Law. The president has for instance insisted that the proviso in the constitution which has allowed him to dismiss the government needs to be reviewed and perhaps amended, but has held that while it exists, its use cannot be unconstitutional. He has also magnanimously pointed out that the Bhutto government's foreign policy initiatives have yielded results – especially in terms of the country's relations with the central Asian countries and that the slant of policy towards its neighbours will see no change in the period before the elections. When challenged that the holding of elections when Pakistan's census enumeration was overdue may be construed as introducing a deliberate bias, he has maintained that the requirement of the constitution is to hold elections within three months.

Nevertheless, Bhutto's attempts to come back to power in the February elections are severely hampered by various factors, some of which are the consequence of the president's actions. There have been rumblings within the Pakistan People's Party (PPP) and reports indicate that the president is himself putting together a new party drawing upon those in the PPP who have become disenchanted with the Bhutto regime. At the moment there does not appear to be a rallying of forces around Bhutto. But these are early days yet, and much can happen before February.

CURRENT STATISTICS

EPW RESEARCH FOUNDATION

Despite a copious south-west monsoon and a possible bumper crop, the general WPI and the indices of primary (and food) articles as also foodgrains have all registered steady unseasonal increases since end-September. The rise in the WPI this year so far at 6.6 per cent has been higher than that over the same period of last year (5 per cent). The composite food index has registered a rise of 12.3 per cent so far against only 7.7 per cent last year. The price increases have been much higher this year in all commodity groups and sub-groups with the exception of non-food manufactured products.

GREAVES

Growing Market

AFTER a 1:2 bonus issue last year, Greaves has further improved its performance during 1995-96 with a 42.1 per cent increase in net sales and a 40.8 per cent increase in value of production. This Lalit Mohan Thapar group company is engaged in the manufacture of engines, road rollers, gears, boilers, filters, cranes, hoists, pumps, diesel three-wheeler auto rickshaws, spares and accessories. With a somewhat lower increase in operating expenses, operating profit rose by 45.9 per cent during the year under review. Lower increases in interest (31.6 per cent), depreciation (8.9 per cent) and tax provision (22.9 per cent) helped the company post a 98.9 per cent higher net profit. Exports too were higher by 12.2 per cent, though imports rose by a steeper 63.7 per cent over the previous year. With the rise in the bottom-line, the company's earnings per share rose from Rs 4.9 to Rs 6.5. Book value, however, was lower at Rs 47.8 compared to Rs 67.2 in the previous year due to the bonus issue last year which increased the equity by 50 per cent.

With the company's 'Greaves Garuda', a diesel three-wheeler, being well received in the market, Greaves has undertaken to double its production capacity. The company was able to corner up to 12 per cent of the market, which is currently dominated by Bajaj Auto, mainly due to the Greaves Garuda's lower operating costs, despite the diesel version being priced 15 per cent higher than Bajaj Auto's petrol version three-wheeler. Greaves is also planning to introduce an eco-friendly four stroke petrol engined three-wheeler during 1996-97. Deluxe and economy models of the vehicle are likely to be introduced, both in the passenger and load-carrying segments, sometime during 1997-98. The project to manufacture lightweight portable diesel engines at Ranipet in Tamil Nadu, to support the three-wheeler growth plans, has already been completed.

Greaves, meanwhile, has entered into a technical collaboration agreement with SAME spa, Italy, for the manufacture of agricultural tractors and it has already signed a joint venture agreement with the collaborator for the manufacture of diesel engines for tractors and other uses. Christened as SAME Greaves JVC, the joint venture company will have an equity capital of Rs 25 crore with SAME holding a 51 per cent stake. Greaves may also enter the small car market segment in the next two to three years through the joint venture with SAME. The company has also chalked out plans to

invest up to Rs 250 crore in the next three years in a series of capacity expansions, principally in its high speed diesel and medium/high horse power engine manufacturing plants. Expenditure in 1996-97 and 1997-98 is expected to be around Rs 108 crore which will be financed through term loans of Rs 66 crore and internal accruals.

Meanwhile, the company's share price currently quotes at around Rs 50 on the Bombay Stock Exchange, discounting its 1995-96 earnings per share by 7.7 times.

HERO HONDA

Capacity Expansion

Reflecting the buoyant position in the two-wheeler industry, Hero Honda Motors, the largest manufacturer of motorcycles in the country has performed well in 1995-96, notching a 32.7 per cent rise in net sales and a 21.7 per cent increase in value of production over the previous year. A joint venture between the Munjal group and Honda of Japan, Hero Honda Motors' product line primarily consists of 100 cc motorcycles with the company commanding a market share of 8.7 per cent in 1995-96, up 0.4 per cent from last year's 8.3 per cent. Not surprising, considering that the company spends up to 2.6 per cent (1994-95: 1.4 per cent) of its value of production on advertising.

Production of motorcycles during the year under review increased from 1,83,490 vehicles to 2,30,084 vehicles, representing an increase of 25 per cent, with the company's plant operating at more than 100 per cent capacity. Sales volume also increased by 23 per cent during the year from 1,83,650 vehicles to 2,30,164 vehicles. Against this the two-wheeler industry itself registered an overall growth of around 20 per cent in 1995-96.

The company has one of the lowest operating costs in the two-wheeler industry. This is reflected in the fact that though production increased by around 25 per cent over the previous year, manufacturing expenses increased by only 17.4 per cent. Consequently operating profit increased by 26.6 per cent. Despite a 16.3 per cent increase in the company's loan portfolio, interest charges fell by 14.5 per cent depicting its optimum loan structure management. Net profit increased by 35.5 per cent over the previous year resulting in the company's earnings per share rising from Rs 9.7 in 1994-95 to Rs 13.2 during 1995-96.

Export sales also rose from 10,475 motorcycles in 1994-95 to 11,937 motorcycles in 1995-96, representing an increase of over 14 per cent. The company

entered the Colombian market for the first time and also held a number of service training programmes in various countries during the year. With higher realisation, export revenue increased by a higher 30.4 per cent. On the other hand, though the company continued its status as a net importer, imports fell by 14.5 per cent during the year.

With its plant already performing over full capacity, the company is currently increasing capacity to 3,00,000 vehicles. It is also setting up a new plant with an installed capacity of 1,50,000 vehicles at Gurgaon at an estimated cost of around Rs 174 crore. The company expects these projects to be completed in 1998, after which it will have a total capacity of 4,50,000 vehicles per annum. These expansion programmes are to be financed primarily through internal accruals and a limited exposure to loan funds. With the two-wheeler market expected to increase from the current 8,00,000 vehicles to around 16,00,000 vehicles by the turn of the century, this expansion will help the company further consolidate its presence in the domestic market. With this in view, it plans to introduce three new models of motorcycles, the first of which will be a 100 cc vehicle with certain new features. The next two models will be in the 125 cc to 150 cc range.

The company's strong fundamentals and growth prospects are reflected in its share price on the bourses which currently rules at around Rs 230 discounting its 1995-96 earnings per share a healthy 17.2 times.

HINDUSTAN ORGANIC CHEMICALS

Higher Profit

Hindustan Organic Chemicals (HOC) manufactures a variety of organic chemicals which include phenol (35 per cent of total sales), acetone (22.8 per cent of sales), aniline (14.8 per cent of sales), nitroproducts (14.5 per cent of sales), acetanilide, acids, formaldehyde, chlorobenzene, acetyl products, propylene and cumene. A public sector undertaking, HOC is a market leader in practically every one of the above products. The company posted a sharp increase in profits in 1995-96 when it also achieved its highest ever capacity utilisation. While net sales increased by 28.1 per cent over the previous year, 1994-95, there was a 26.7 per cent rise in value of production over the same period. Production of phenol, the largest contributor to turnover, increased by 14.9 per cent from 37,688 metric tonnes (mt) to 43,302 mt while that of acetone, the second largest contributor to turnover, increased from 23,576 mt to 27,024 mt, a rise of 14.6

- means not available.

per cent. Sale volume of these two products also increased from 37,317 mt in 1994-95 to 43,489 mt in 1995-96 for phenol (up 16.5 per cent) and from 22,297 mt to 27,337 mt for acetone (up 22.6 per cent). During the year, total chemicals produced by the company increased by 12 per cent from 2,72,523 mt last year to 3,04,977 mt. The company's trading division also saw a 44 per cent increase in turnover with a number of new products being added to the list. The division also carries out market seeding for new products that the company proposes to manufacture (including hydrogen peroxide, 4-4' di-phenyl di-isocyanate, PU systems, etc).

A tight leash on manufacturing expenses (up 17.5 per cent) and other operating expenses led to a 71.6 per cent rise in operating profit during the year under review. Effective cash management also helped the company post a 42.3 per cent fall in interest charges despite a 13.2 per cent rise in total loans. In spite of a 33 per cent increase in depreciation charges and a Rs 9.5 crore tax provision (1994-95: Nil), net profit improved by a phenomenal 110.2 per cent over the previous year. The company claims that the improved results were due to various reasons such as efficiency improvement, optimisation of operations, setting up of strategic business units (SBUs), productivity improvement through continuous management audit, effective management of inventory, improved energy efficiency, higher capacity utilisation and a deliberate strategy of strengthening customer relations and quality of services. The company's earnings per share rose from Rs 4.1 in the previous year to Rs 8.7 while book value increased from Rs 51.5 to Rs 58.1 over the same period. Encouraged by its performance, the company raised the dividend rate from 16 per cent last year to 20 per cent in the year under review.

The only blemish in the otherwise excellent performance of the company was a sharp fall in exports (down 34 per cent) and an even sharper increase in imports (up 41 per cent) over the previous year.

During the year, the company commissioned its co-generation and acetyl plant and managed to recover an even higher percentage of ortho-nitrochlorobenzene from wastes.

The company's strategy during the Ninth Plan period (1997-98 to 2001-02) is to further strengthen its market position by expanding its core areas of business, i.e., nitrochlorobenzenes, nitrotoluenes, cyclohexylamine, phenol and intermediate feedstocks. It also has plans to enter into new growth areas.

The company's share price currently quotes at around Rs 30 discounting its 1995-96 earnings per share by an attractive 4.6 times.

MAHARASHTRA

Rising Tide of Resentment

Prakash Bal

The Shiv Sena-BJP alliance is in troubled waters, having to contend with Anna Hazare's allegations of large-scale corruption by its ministers, the judicial strictures on its conduct in the Enron renegotiation, and the sharp resentment of the Maharashtrian middle class prompted by the Sena chief's ill-considered criticism of its literary icon. While these events have shaken the ruling alliance, there is no political force in the state which can channel the popular discontent.

EARLY this week, in a span of 24 hours, the Sena-BJP government was lashed by the Bombay High Court, by Marathi litterateurs and by the common man. While dismissing the writ petition against the Enron power project at Dabhol, the division bench of the Bombay High Court passed severe strictures against the state government. A wave of anger and dismay has erupted in Marathi literary circles after Bal Thackeray criticised a renowned satirist, playwright and author P. L. Deshpande for his speech in which he made a veiled reference to the Shiv Sena chief's open admiration of 'thokshahi' (dictatorship). On the top of this the Sena-BJP combine has suffered a blow in the municipal council elections.

The Sena-BJP alliance had come to power on the plank of anti-corruption. As an opposition leader Gopinath Munde, the present deputy chief minister, had taken out a 'Bhrashtachar Virodhi Yatra' and had termed Enron an epitome of corruption in Sharad Pawar's Congress regime. He had promised the electorate that if they voted the Sena-BJP to power, it would throw Enron into the Arabian sea. Instead of fulfilling this promise the Sena-BJP government first cancelled the permission given to Enron after enacting a farce of an inquiry and then immediately renegotiated the deal allowing the multinational power corporation to start work at Dabhol. Now Bombay High Court has described the conduct of the state government in the whole episode as 'reprehensible'. The court has observed that "renegotiations conducted by the state government were not transparent and at every stage it is the common man who was taken for a ride by the Sena-BJP alliance by making Enron an election issue". The court has further said that the government acted not in the national interest, but in its political interests. This severe indictment by the court comes in the wake of the anti-corruption movement launched by Anna Hazare, a social activist from Ahmednagar district. This judgment would now give a fillip to Hazare's movement.

This movement has become the bugbear of the Sena-BJP alliance. Hazare had

launched a similar agitation against corruption when Pawar was the chief minister. At that time the BJP had supported Hazare and its workers as well as 'swayamsevaks' from RSS had taken part in his movement. Hazare had gone on a fast at that time and demanded that the government should take immediate action against employees in the forest department against whom he had made allegations of corruption. Pawar had promised to take action and Hazare gave up his fast. But no action was taken against those employees, not even by the present Sena-BJP regime.

Hazare has a record of selfless service and his work of village development in Ralegan Sidhi, a village in Parner taluka of Ahmednagar district has been praised all around. Hazare was in the army and had fought in the 1965 Indo-Pak war. After demobilisation he returned to his native village. That was the time when Maharashtra was reeling under a severe drought. Ahmednagar district is a drought-prone area and people from Ralegan Sidhi were affected. This spurred Hazare and he started thinking in terms of watershed management, afforestation, soil conservation, etc. He took up this challenge and transformed Ralegan Sidhi into an ideal village. Along with this development work Hazare laid stress on literacy and the anti-liquor movement. Previously Ralegan was notorious for its liquor dens and drunkards were aplenty in the village. In fact the name of the village was originally 'Ralegan Shindi' and 'Shindi' part of the name was derived from liquor which used to be distilled from the bark of 'Shindi' trees. When the village became liquor free its name was changed from 'Ralegan Shindi' to 'Ralegan Sidhi'.

During his work Hazare came face to face with the corrupt bureaucracy at the village and taluka levels. He realised that the major part of the money earmarked for development schemes was going into the pockets of local bureaucrats and the politicians who protect them. Since then Hazare has been grappling with this problem. He has been launching, off and on, various types of agitations against

corruption. His forte is that he methodically collects evidence of corruption and malpractices and demands that government take action against guilty officers and employees. In various departments of government, viz, irrigation, forestry, agriculture there are some 'lucrative' posts, such as executive engineer of irrigation projects or in the directorate of agricultural services. Appointment to these posts is viewed as a sort of passport to prosperity. Hence there is always a scramble to get these postings. But those officers who are already working at these posts want to remain there forever. Hence to get a transfer to one of these posts or to remain on these posts, a lot of money changes hands. It has been always rumoured that a part of this booty goes to the minister concerned and hence 'auction' of these posts goes on without any hindrance. Along with this, those officers who are found to be 'inconvenient' are indiscriminately transferred. Hazare has meticulously documented the number of transfers effected and reasons behind such transfers as well as details about the various types of malpractices. From this data he has come to the conclusion that the minister of agriculture Shashikant Sutar and the minister of irrigation Mahadeo Shivankar were responsible for most of these transfers as well as other malpractices. Hence he demanded action against them and pending an inquiry asked the chief minister to remove them from the cabinet. This demand put him against Shiv Sena chief Thackeray.

The BJP had tried to hijack Hazare's movement previously without realising that it is a double-edged weapon. It tried to get some political mileage from Hazare's movement against corruption and malign Sharad Pawar. Shiva Sena however did not jump on the bandwagon of any such movement. It relied mainly on Thackeray's oratorical skills to raise dust against Pawar and his Congress regime. When the Sena-BJP came to power in the state it became clear that it is no different from the Congress. This set them against activists like Anna Hazare and the clash which is taking place now became inevitable.

As is his wont Hazare first tried to convince the government to take action against the errant officials and ministers. He first met Bal Thackeray after which the Sena chief declared that a policy on transfers had become essential and he would instruct the chief minister to formulate such a policy. Hazare accepted this statement of Sena chief and announced that Thackeray was the only hope of the people in the state. This statement of Hazare raised many an eyebrow and it was thought that Hazare had been co-opted by the Sena and would help now in whitewashing all the irregular and criminal deeds of the present ruling class. When Hazare realised that the Sena chief was not

sincere he became strident and gave an ultimatum to the government to take action against the two ministers. The chief minister asked for 'hard evidence' and Hazare replied that he had already given sufficient proof and if the government were to investigate those cases then the minister's culpability could be easily established. Hazare then announced that he would undertake a fast and the chief minister panicked. To placate Hazare, he announced the formation of a committee comprising Sena chief Thackeray, BJP secretary Pramod Mahajan and Hazare himself, assuring Hazare that if the proposed committee found the ministers guilty then they would be removed immediately. This ploy of the chief minister might have worked, as Hazare was willing to participate in this committee, but for a remark made by Narayan Rane, a minister in the state cabinet, who is one of the accused in a case of murder and is close to the Sena chief. Rane's remark enraged Hazare and he questioned the sincerity of the government. Thackeray then launched a tirade against Hazare, questioning his bona fides, expressing doubts about his sincerity and giving a veiled threat to unmask financial irregularities in Hazare's organisation. Whereupon Hazare challenged the Sena chief to institute an independent probe to investigate his as well as Thackeray's financial affairs.

This exchange of words led to Hazare's fast. People from various walks of life started streaming towards Ralegan Siddhi. It became a sort of new political pilgrimage centre. The chief minister was alarmed by the way Hazare was drawing crowds. Hence to defuse the crisis he asked the two ministers to submit their resignation letters to him, but announced that they would be forwarded to the governor only if the inquiry conducted by S W Puranik, a retired judge of Bombay High Court found them guilty. Till then Sutar and Shivankar would remain ministers without portfolios. The government asked Justice Puranik to give his report within two months and issued a notification to that effect. But Hazare declined to give up his fast and co-operate with the Puranik Commission. He demanded that there should be two more members on the commission and he would suggest the names of these two members. Along with this he also demanded that the government set up vigilance committees at the taluka and district levels. At the same time Hazare declared that he would undertake a statewide tour. The state government has rejected both these demands and the Sena chief has vowed not to allow 'his' government to "dance to the tune of Mr Hazare". This indicates that a political decision seems to have been taken by the Sena now to confront Hazare and go on an offensive. This means that Thackeray's line of thinking has again become dominant and chief minister Manohar Joshi has been forced to stop his mediatory efforts. Hazare has given up his fast and started his statewide tour and has also announced that if the government tried to obstruct his tour in any way he would launch a 'jail bharo' agitation.

After Anna Hazare openly started criticising the Sena-BJP government and asked Sutar and Shivankar to resign, there has seemed to be a divergence of views in the Sena. Thackeray had always refused to accept any of Hazare's demands viewing them as a challenge to his authority. Since Narayan Rane and Sutar are close to him Thackeray felt that his men were being attacked deliberately and that he was the real target of Hazare. Surprisingly, till last year's assembly elections, Sutar was not even allowed entry into the Sena chief's inner circle. In fact in one of his public meetings at Pune, the Sena chief had openly criticised Sutar and thundered that he was aware of his ways. This implies that the Sena chief was aware of various scandals of unauthorised constructions in which Sutar's name has been mentioned. It was believed that a close friend of Raj Thackeray, who was in charge of Sena affairs in Pune city was behind this outburst of Thackeray. At the time of elections Sutar's candidature was not initially considered. He was on the verge of joining Congress and contesting the elections and Congress also was aware of Sutar's 'winnability' and it had no qualms about allowing him to contest on party ticket. But it was argued by Manohar Joshi that every seat was valuable for Sena and those who could win the seat should be given the party's candidature. Hence Sutar became the Sena candidate on the strength of his 'winnability'. How did he worm his way into the inner circle of the Sena chief? It is being rumoured that he was instrumental in helping the Sena chief and his nephew to tide over the crisis in the Ramesh Kini affair. Therefore a demand for his resignation was not acceptable to the Sena chief.

On the other hand, the Sena chief harbours a suspicion that the chief minister did not protect the interests of Thackeray family effectively enough in the Ramesh Kini affair. He was even toying with the idea of replacing Joshi with Narayan Rane. All of a sudden interviews with Rane were splashed on the front pages of *Samna*. Joshi knows the Sena chief well and has tried to use Hazare's agitation to strengthen his position. In spite of the Sena chief declaring that no minister would resign, the chief minister asked Sutar and Shivankar to submit their resignations. Joshi even announced the setting up of an inquiry. This was not to the liking of the Sena chief. But these efforts of the chief minister proved in vain as Hazare has refused to back down.

The BJP's role in this affair has been dubious. As always the party has tried to join the movement and take control while proclaiming its support for Hazare's aims. BJP's state president Suryabhan Wahadne and national secretary Pramod Mahajan have publicly backed Hazare's movement against corruption. At the same time the party has refused to direct Shivankar to submit his resignation. BJP has a long-term strategy. The party knows that the Sena's edifice will crumble within no time after Thackeray. The

party's aim is to draw a large chunk of the Sena to its fold in such an eventuality. Hence it is pandering to the whims and fancies of the Sena chief. But this strategy has its problems and they have come into full glare after the recent municipal council polls and the verbal duel between Thackeray and the well known Marathi satirist P L Deshpande.

The state government has instituted an award to be given to a person who has contributed in furthering the image of Maharashtra. The first award comprising a cash amount of Rs 5 lakh and citation was given to P L Deshpande. While replying to the felicitation the well known and widely admired satirist expressed dismay at the present situation in the state and regretted that those who have come to power through democratic means are indulging in and advocating dictatorial ways. This barb was aimed at Thackeray because he has expressed his admiration for Hitler umpteen times and has always castigated democracy advocating *thokshahi* (dictatorship). The Sena chief took this as a personal insult and lambasted him publicly in intemperate language. Thackeray declared that the state government was initially inclined to give this award to him, but he declined it and allowed it to be given to Deshpande. If Deshpande does not like my language of 'thokshahi', thundered Thackeray, then why did he accept the award? This episode has created a wave of anger among the Marathi middle class to whom P L Deshpande is an icon. They are not ready to countenance any insult to their icon. This middle class has been the backbone in Sena's winning streak in Mumbai, Pune and Konkan region. Hence in the face of this counter-criticism the Sena chief has backed down to some extent and has tried to make amends. But this event reflects the mood of the people in the state and their rising resentment against the ways and means adopted by the Sena chief, his family members and their cohorts. The setback which the Sena and the BJP has experienced in the recently concluded municipal polls also bears testimony to this changing trend. Sena has been trounced in two of its bastions, viz, Konkan and Marathwada.

The tragedy is that no other political party in the state is in a position to channel this rising tide of resentment. Congress has remained in doldrums after the defeat in the assembly elections. The Janata Dal has no presence in the state and is bereft of any organisation. Communist parties have only small pockets of influence. The Samajwadi Party of Mulayam Singh Yadav has a presence in Mumbai only and that too in the Muslim majority areas. Though the Samajwadi candidate won the assembly by-poll by defeating the Sena candidate, the party cannot pose any serious challenge to the Sena-BJP alliance. The real test of this alliance will come early next year when Mumbai and Thane Municipal Corporation elections are due. If the Sena suffers a setback in these elections, then that would herald a new era in state politics.

Open Letter to Home Minister

Foreign Funds and Threat to Voluntary Sector

The Foreign Contribution Regulation Act under which the voluntary sector receives a large amount of funds needs to be urgently amended to prevent misuse of foreign funds and to bring a degree of accountability in the sector.

DEAR MR GUPTA,

I am writing about the urgent need to amend the Foreign Contribution Regulation Act (FCRA). As you know over Rs 2,000 crore comes in every year from foreign donor agencies for rural development purposes through the FCRA and over 10,000 so-called registered voluntary groups receive this money. With too much money coming in, with no self-discipline or public accountability, with some groups building colossal empires the spirit of volunteerism is being slowly destroyed. Unless the government steps in with suitable amendments to the FCRA I fear corruption, co-option (by foreign donors) and confusion on a massive scale.

It's been over 10 years since the FCRA was put into effect and we like to think we have learnt from this experience. It was unfortunate that when the FCRA became law an open debate on the need for a code of conduct was agitating the voluntary sector and unscrupulous groups who were against any code compromising their lifestyle deliberately confused the issue thus successfully delaying any code from being adopted unanimously. Those opposed to any code enforcing discipline and accountability in desperation formed Voluntary Action Network India (VANI) and the individuals who opposed the code of conduct at that time were backed by massive foreign money. Today they still receive crores of rupees and the lifestyle of those living in the urban cities could match with any senior company executive in a multinational firm. If poverty was big business in the 1980s volunteerism is big business in the 1990s with every non-gazetted officer (ngo) starting an NGO. What a sad and tragic state of affairs that government should believe such immoral and hypocritical people to speak for grass roots groups.

It is a question of self-respect. Do we want the spirit of volunteerism to be up for sale? Do we want the fantastic work that small groups are doing showing such tremendous courage and struggling with no money (government or foreign) against injustice, discrimination, corruption and inequalities to be equated and identified with such third rate people? Surely they deserve better from this government. The voluntary groups have been splintered, they have lost their idealism and identity, they have compromised their

values, their simplicity and their integrity all because too much foreign money is available too easily. All along we are watching the moral rot being spread by such scoundrels speaking of the exaggerated fears of the control of the state.

Surely it is time for the state to step in and you as home minister has the responsibility to see such scoundrels do not get away. The FCRA is full of loopholes which let them get away with it while genuine small village groups suffer. They do not have lawyers and accountants costing lakhs to protect them. They are all at the mercy of 'thanedars' and policemen who have no idea of the type of work voluntary groups do - even today. So groups who do use foreign funds wisely are consistently harassed because they come face to face with vested interests at the village level. They are fighting bonded labour, non-payment of minimum wages, untouchability, corruption of village officials, embezzlement and other such issues for the government because the administrative machinery is on the verge of collapse. Yet they are being hounded while laid back criminally rich foreign funded groups receiving funds from the World Bank and the UN doing irrelevant work such as advocacy (whatever that means), training, (non)participatory research and producing glossy reports, studies and newsletters no one reads go scot-free. Where is your sense of justice?

Now as a result of indecision, neglect and delay the threat to the voluntary sector is from within. More than 90 per cent of the groups are totally dependent on foreign funds. They have no other source of income, they have not even thought of raising and generating funds of their own from within the country and as a result become professional beggars running around raising money by any means for whatever cause just to keep their defunct organisation alive. Stretched far beyond their means because easy foreign money is available they have become institutionalised, inflexible and incapable of innovation of any kind. Arrogant to the core when they should be supplementing government effort they are competing with the district administration in some states. Morally bankrupt they think coverage and quantity and massive expenditure is a substitute for quality. Now they are justifying themselves by com-

missioning studies titled 'Big is Beautiful'.

Regrettably a tighter FCRA is the only way of controlling these monsters and setting an example. If the voluntary groups cannot put their act together if they cannot see the writing on the wall and the poor example the well-funded groups are setting for the smaller village groups then the only way to make them understand is to hit them on the head with the law. Let them scream and rant and rave in international forums abusing the government and the state: let them organise seminars and workshops and churn out papers how their version of volunteerism is being threatened: how civil society (that is what it is called these days) is in for a bad time and dark days are ahead. It's all hot air: they have the platform, the ear of the press and the control of the printed word outside India to some extent because there are scoundrels like them in every country of the world. But believe me, minister, it will send a powerful positive message to the voluntary groups at the village level who see this open abuse of a nation's self-respect and pride by a handful of opportunists with great concern and they will applaud the steps you have taken. Privately and silently the foreign donor agencies would also welcome this move towards control, discipline and public accountability, those whose intentions in this country are in any way evil will leave which is what we want. Just to satisfy the whims of a few, just to quieten the voices of a handful who have the potential to temporarily give India a bad press should the whole voluntary sector be held to ransom?

Is it the policy of the government to privatise and commercialise the voluntary sector? Through the misuse of the FCRA this is exactly what is happening. We know \$ 500 is perhaps the poverty level in the north but it is what the secretary to the government of India gets today. Anyone who is on the 'dole' unemployed and living off the social security of the state gets this amount in the north but is it ethical to claim this amount as salary in India in the voluntary sector if they claim to be working for the rural poor, the oppressed millions who barely make \$ 30 a month if they are lucky. It makes them parasites getting money in the name of the poor and living in luxury. And your government, minister, is watching this impotently. For four years the FCRA is being amended. It's time to act now.

What are the areas that need to be addressed in the amended act?

First, the amount of funds one organisation can receive from abroad. There must be a limit, an upper limit, even if it means the organisation must split into several smaller entities. An organisation that does not have the capacity to raise funds from within the country - government, industry, banks - it should not be entitled to receive foreign funds. This will reduce the unhealthy dependency on foreign funding. The rule

should be that the organisation can receive as much foreign money as they can raise from within the country. At least this will drastically limit the proliferation that is taking place today of hundreds of groups drawing more than Rs 5 crore with no potential to be self-reliant.

Second, the act must stipulate the ceiling on administrative expenses. The money has come for the poor. If over 50-60 per cent goes on salaries what actually reaches the poor? The executive committee of the Council for Peoples' Action and Rural Technology (CAPART) – on the verge of coming apart – has approved the filling of a Transparency Form obliging the organisation to give greater financial and administrative details. Before any project is considered for financial support by this parastatal organisation of the department of rural development greater transparency is expected. After all public funds coming from abroad are being spent in this country. Along with FC3 the Transparency Form must be filled and sent to the ministry of home affairs. If this is violating the fundamental rights of an Indian citizen then this objection could be read as violating the trust the foreign donor expects from the group which certifies that the public donation from abroad will be well spent. This is not a question of rights; it's a question of public accountability and transparency in financial and administrative

matters. What was debated in the code of conduct campaign in the late 1980s has been included in the Transparency Form that CAPART has accepted today. It has taken a decade for the system to accept this in spite of the objections from within the voluntary sector. If CAPART has accepted it so can the ministry of home affairs and include it in the amended FCRA.

Third, all this information must be accessible to the public. They have a right to this information since it does not endanger the security of the state. How foreign and Indian funds have been spent on rural development, the financial and administrative details of the organisation contained in the Transparency Form should be open to public scrutiny under law. Any village panchayat can ask for copies of documents from this organisation on any issue – salary structure, staff benefits, bills, vouchers, receipts pertaining to any project supposedly spent on rural development. It is not only the job of the police to monitor and demand records from the organisation receiving foreign funding: it is the right of the rural communities as well. Today colossal organisations receiving massive foreign funding think they are above the law. Their audit statements and annual reports are secret, their staff strength and what they pay them are secret. Anyone not part of the 'inner circle' who questions too much, who

seeks answers especially in those organisations that claim to be participatory are thrown out. The contrast between management and staff, the communication and credibility gap is enough to breed resentment, discontent and anger: the duplicity and hypocrisy is carefully concealed and the fear of god is put into them – if they dare speak out they suffer the consequences of dismissal, of public humiliation, of the doors being closed to them by other organisations. Where is the spirit of volunteerism today? where have honesty, sacrifice and courage gone? Who are the so-called successful role models that youngsters copy today in the voluntary sector those who have made money, those who run large organisations, those who travel to seminars and workshops abroad, those who speak smoothly but have nothing to show on the ground. Look what easy foreign money has done.

Home minister, I hope you are reading this carefully. I speak with 25 years of interacting with foreign donor agencies, hearing their anguish and speaking with village groups. I know the politics of international agencies and how they view India. So believe me what I have written should not be taken lightly. It is the truth. Acting on these suggestions will give us a little more self-respect. I look forward to hearing from you.

Bunker Roy

How Relevant Are Rural Water Supply Programmes?

S K Pant

An evaluation study of the rural water supply programme in eight districts of eastern UP reveals a low level of coverage and poor maintenance record. If the safe water programme is to be effectively implemented, greater participation from the local people, especially women, is needed.

IN a country where around 1.5 million children below the age of five years die due to water-borne diseases every year, and the nation loses 1,800 million person-hours (over 200 million mandays), the supply of safe drinking water has been given a high priority in Indian planning. Responsibility for providing safe drinking water in rural areas rests with the states, and funds have been provided in the state budgets right from the commencement of the First Five-Year Plan. It was envisaged that the states would build up the necessary infrastructure to attend to the problems of water supply and sanitation. In spite of all these efforts, it was observed during the mid-1960s that these schemes were being implemented only in villages with easy access. The Government of India therefore requested the states to identify hard-core problem areas and provided assistance to the states to carry out special investigations during the Fourth Plan. In 1972-73, in yet another effort to accelerate the pace of coverage, the centre introduced the Accelerated Rural Water Supply Scheme (ARWS) to cover the problem areas with 100 per cent grant.¹ In August 1985, the subject of rural water supply and sanitation was transferred from the ministry of urban development to the department of rural development with the basic objective of securing the implementation of the programme and its integration with other rural development programmes.

Despite the impressive coverage of rural areas in subsequent plans, the conditions prevailing in rural areas remain far from satisfactory. Just when it was thought that there were hardly 500 villages left to be provided with safe drinking water (at the commencement of the Eighth Plan), the subsequent feed-back from the field depicted a different picture. Many of the previously covered areas had fallen back into the 'no source' (NC) category, and these figures assumed alarming proportions which subsequently called for another round of investigation.

Accepting the norms laid down by the Rajiv Gandhi National Drinking Water Mission for classifying habitations into

partially covered (PC) and fully covered (FC) categories, as well as for identifying sources as 'safe sources', the study described here evaluated the current status of safe water in eight sample districts of eastern Uttar Pradesh. Specifically, it focused on: (a) the pattern of NC (not covered) habitations; (b) the level of water supply and types of system being used; (c) the problem of non-perenniality, if any, and related issues, viz, period of non-operation, water quality, and environmental problems, and identification of plausible factors; and (d) community participation, women's involvement, communities' perception of the programme agenda.

The study, undertaken by the G B Pant Social Science Institute, Allahabad, on behalf of the Rajiv Gandhi National Drinking Water Mission in 1994-95, covered 3,715 habitations from the following eight districts of eastern UP: Azamgarh, Bahraich, Basti, Gorakhpur, Gonda, Maharajganj, Mau and Sidharathnagar.

Of these, 35.8 per cent were main habitations and 64.2 per cent were 'other' habitations. The survey revealed that only a little over 31 per cent of the habitations have been provided with 100 per cent coverage. Moreover, the progress achieved in the main habitations has been much better than in the 'other' habitations. While 45 per cent of main habitations qualified for the 'FC' norm, the level was barely under 24 per cent in the other habitations. However, the survey revealed that in hardly 0.02 per cent of habitations, less than 10 per cent of the population had been provided with safe water supply, which indicates the progress of the nodal agency. But the emphasis has been on the coverage of main habitations. Even the inter-regional comparison of coverage pattern shows uneven progress, with the highest being at just under 60 per cent achieved in Basti and lowest in Mau district at a little over 12 per cent.

The study of distribution pattern of resources is yet another indicator for evaluating the nodal agency's progress. A sizeable proportion of the inhabitants in the region (over 75 per cent) have to depend on

sources which have not been declared to be safe sources. Just 23 per cent of habitations had access to safe drinking sources, and the proportion depending on unsafe sources was much higher in districts like Gonda, Mau and Maharajganj, where over 88 per cent and 82 per cent of local inhabitants were exposed to unsafe sources, respectively.

The analysis also shows that the entire region had a very low level of incidence of non-perenniality. In all, only 11 sources accounting for a little over 0.11 per cent of the total sources were facing this problem, out of which 56 or 54 per cent belonged to main habitations and the remaining 45 per cent were located in other habitations.

The districts which suffered most from this problem were Azamgarh, Gorakhpur and Maharajganj. In addition, the pattern of defunct resources reveals the shocking state of upkeep of these precious resources.

The success of any programme depends to a large extent upon the extent to which it motivates the people of the area and induces them to take an active part in the developmental programmes initiated in their region. The study of participation of communities in the region is not encouraging, as only a little over 36 per cent of the inhabitants in the entire region had been involved in the planning, selection of location, etc., of which the level of participation in the main habitations was almost twice of what it had been in the other habitations. Similarly, community participation in other sample districts showed a marked variation, with Basti heading the overall list and Mau finishing at the bottom.

The other aspect which the study highlights is the inhabitants' total indifference or antipathy towards the operation and maintenance part of the programme. Only 16 per cent of the inhabitants expressed their willingness to participate. Hardly 22 per cent of the sources have been properly looked after. It was also shocking to note that there are no records of 16 per cent of the resources, it is presumed that these may have been installed by other agencies working in the region whose details are not with the nodal agency. Fourteen per cent of the sources were being maintained by the nodal agency, a little over 6 per cent by block officials, whereas the proportion of NGOs operating in this area was less than 1 per cent.

Similarly, the inhabitants' indifferent attitude towards the programme could be seen in the extent to which they volunteer to maintain the resources implemented within their region. The study shows that a little over 5 per cent of inhabitants had agreed to maintain these resources; once again their ratio was much higher in main habitation as compared to their counterparts. However, there has been a shift in the stand of inhabitants on the question of payment for

the maintenance of resources. Around 22 per cent of the inhabitants expressed willingness to share the burden of maintenance.

The development of the region on a sustainable basis is possible only if women also participate in the programme in a big way. A higher level of female participation ensures brighter chances of success. However, the study of female participation in the programmes in the region shows a dismal picture, and could be one of the cardinal factors affecting the performance of the programme. It could be seen that women have virtually been sidelined, as their involvement for the region as a whole was barely 1 per cent (0.81 per cent to be precise). What was really shocking was to see that in Sidharthnagar and Mau their participation was nil.

The study clearly shows that the performance of the normal water supply programme in the region has been somewhat disappointing. However, before arriving at any conclusion it would be befitting to examine some of the key issues. The analysis clearly shows that one of the prime reasons for the poor performance has been the local inhabitants' poor response to these programmes. According to them, the venue selected for installing the public stand post gets frequently shifted to a new place for no apparent reason. They allege that this takes place at the behest of a few influential people, who with the passage of time, start treating these resources as their own property. This was partially corroborated by the nodal agency during the course of discussion. According to them, since the agency has no budgetary provision for maintenance of the resource, they have to depend on local resources, which only a few influential people could afford. The price of installing the new handpump generally takes about three to four days and takes the assistance of at least four men. The task of feeding these personnel, therefore, lies with local inhabitants. This situation is exploited to the hilt. However, according to the agency such instances do not happen frequently.

Another factor contributing to poor performance is the deliberate omission of local inhabitants at the crucial 'gaon sabha' or village council meetings, during which all major decisions and programmes for village development are chalked out. The inhabitants, by and large, claimed that they are often not informed on time about such meetings; as a result they seldom participate.

All these considerations have forced a sizeable proportion of the population to utilise 'other' sources which are highly unsafe, and it was not surprising to find every alternate household having a shallow handpump at its doorstep. This not only exposes the inhabitants to various kinds of health hazard but also lowers the image of the nodal agency

in the eyes of the public. As the region has not experienced any outbreak of water-borne epidemics in recent times, the concept of 'safe' sources has not been seriously entertained by the inhabitants. However, there have been a few stray cases in two districts, Maharajanj and Gorakhpur, in which the water discharged from shallow handpumps contained excess iron content as shown by its physical appearance. Similarly, in Khalilabad tehsil of Basti district and in Nawabganj tehsil of Gonda district, the water emanating from shallow handpumps contained some foul smell, which may have been because those places had sugar factories in the vicinity and their discharge seems to have affected the first strata of the underground water table.

The study also highlights the overwhelming priority the 'main' habitations got over the 'other' habitations. This may be due to locational advantage, i.e., better infrastructural facilities and more importantly proximity to power, as it was observed that the representation of these areas in the gaon sabha or village councils was regular and 'gram pradhans' generally hailed from these habitations. In the light of the above observations, it would be better if the other habitations also get a chance at representation; for this purpose the post of gram pradhan could be on a rotation basis.

The norm of classifying habitations into partially covered and fully covered based on distance appears to be quite unrealistic, since it does not reflect the actual programmes of the nodal agency. It is mainly women who find this distance quite inconvenient to trek, besides attending to other household chores. Moreover, the distance as measured by the nodal agency is based on a 'straight line pattern', which is not in conformity to the ground realities. These habitations, for all practical purposes, remain NC habitations. Therefore, it is argued that it would be appropriate if this distance norm is further brought down to, say, 150 to 200 metres, which is possible only if more such public hydrants are installed and their distribution is evenly marked.

The study also observed that apart from the nodal agency, there were other agencies or co-operatives/organisations which were engaged in similar work. However, what was most disturbing about their functioning was the total lack of co-ordination between them; this may be one reason for the poor upkeep of these resources, as one agency does not keep any record of the previous one's work. As a result, the work at times, gets duplicated, which limits the scope of the programme. Hence, if some sort of co-ordination is evolved between various agencies in the region, not only will the performance of the programme improve

but its coverage will be considerably enhanced.

It was also noted that though the agency provided mechanics at each block with the primary function of attending to defunct sources, they had a very large area to attend to, which at times became quite difficult if not altogether impossible for them to cover within the given time-frame. Since the nodal agency did not have provision for allowances, the mechanics gradually lost interest in the work and subsequently had to rely on local inhabitants' resources. Besides, the callous attitude adopted by the inhabitants in not relaying information in time also compounded the matter, and the task of rejuvenating defunct¹ sources naturally suffered. In this regard, it could be suggested that the mechanics may be posted at the village panchayat level, which will decrease their area of work and improve their efficiency.

The nodal agency's policy of not permitting mechanics from outside to attend to defunct resources also spelt disaster for the programme and needs to be modified because it is based on unsound premises. It is true that the repair of hydrants requires specialised training and capital intensive accessories, which the local mechanics lack. But given the present scenario, it would be quite pertinent to encourage local talent to emerge under their supervision. This gesture would help to overcome the problem of the heavy load on agency mechanics, and would subsequently promote a sense of belonging, responsibility and interest in these resources among the inhabitants.

Similarly, the study shows that the rate of participation by non-government agencies has been minimal. Their integration into the rural development programme would not only help in tiding over many problems which the agency faces, viz., under-staffing, lack of co-ordination, etc but would lend some credibility to it in the eyes of the inhabitants. Likewise, their services could be utilised in the areas of creating general awareness, promoting health, hygiene, and education.

Note

- 1 The ARWS is a centrally sponsored plan scheme supplementing the efforts of state governments in providing drinking water in rural areas. During the Sixth Plan, the aim was to provide at least one source in all the 2,31,000 identified problem villages that had remained uncovered at the commencement of the Sixth Plan. With intensive efforts and investment to the order of Rs 2,457 crore (Rs 1,538 crore under state sector MNP and Rs 919 crore under central sector ARWSP), it was possible to cover 1,92,000 problem villages. However, about 39,000 hard-core villages spilled over to the Seventh Plan.

National Renewal Fund and Welfare of Working Classes

K S Chalam

With the industries not taking skill upgradation seriously, and most of the amount obtained under voluntary retirement scheme being exhausted in discharging family responsibilities, the workers, especially those belonging to the SC and OBC categories, hardly stand to benefit from the National Renewal Fund.

THE structural adjustment programme (SAP) initiated by the government in the 1980s was formally declared as new economic policy (NEP) in June 1991 with the declaration of the industrial policy. The 'commanding heights' of the public sector was reduced to the ground level and the private foreign investments were given unbridled entry into the economy. In fact, the slowing down of investment in public sector started in the 1980s in terms of the decline in fixed capital formation compared to the earlier periods. This has affected the capacity utilisation - which is reported to be less than 75 per cent - of the public sector. Several of the public sector units and their managers are helping to improve the capacity of the private sector, and also helping a contractor class to emerge through its sales outlets. Thus, the performance of public sector units in terms of rate of return and other indicators has been in the red. This promoted many public sector tycoons to recommend to the government for the slowing down of investments and reduction of recruitment into the public sector. Some of these policy-makers were involved in the financial scam of 1992.

The support to the Mandal report by the pro-reservation groups created a situation wherein it was imminent for those groups to occupy positions of power and command in the public sector. It was unpalatable to the ruling masters, and the economic crisis prevailing around 1990 was used to wean away the public sector. Thus, the weaker sections were subjected to double marginalisation: retrenchment on one hand and reduced opportunities of entry into the public employment on the other. Anticipating this, the government introduced in 1992 National Renewal Fund (NRF) for the welfare of these rationalised workers.

A major thrust of the NEP is privatisation of public sector. It is maintained that fiscal deficit is the real problem that pushed the policy of privatisation on the government agenda. The easiest way the government thought to overcome fiscal deficit and to some extent from the pressure of inflation is through divestiture of state enterprises. A total amount of Rs 4,950 crore has already been disinvested to the public sector financial institutions by March 1994.

Data presented in Table 1 show the magnitude of the public sector employment.

Further, the rate of growth of employment in this sector has been declining particularly after the NEP. A considerable proportion of these employees are opting for voluntary retirement scheme (VRS) of NRF.

WHAT IS NATIONAL RENEWAL FUND?

After introducing the new industrial policy (NIP) the government realised the importance of initiating a worker safety net to meet the adverse effects of NIP. In fact, the NIP-1991 declared, "government will fully protect the interests of labour, enhance their welfare and equip them in all respects to deal with technological change. Intensive training, skill development and upgradation programmes will be launched." It is further stated that the government will establish a national renewal fund with a substantial corpus. The main objective of this fund will be to ensure that the cost of technological change and mobilisation of productive apparatus does not devolve on the workers. The NRF, it is envisaged, would protect the interests of the workers and provide a social safety net. The broad objectives of the policy are as follows: (1) To provide assistance to cover the costs

of retraining and re-deployment of employees arising as a result of modernisation, technology upgradation and industrial restructuring.

- (2) To provide funds, where necessary for compensation of employees affected by restructuring or closure of industrial units both in the public and private sectors.
- (3) To provide funds for employment generation schemes both in the organised and unorganised sectors in order to provide a social safety net for labour needs arising from the consequences of industrial restructuring.

The NRF, to begin with, took contributions from government, financial institutions, insurance companies and industrial undertakings. In the first year of its existence, the fund was restricted to the payment of VRS in the central public undertakings. A sum of Rs 829.66 crore was allocated during the year 1992-93. In the year 1993-94, an amount of Rs 830 crore for VRS, Rs 50 crore for counselling, retraining and redeployment and Rs 140 crore for worker compensation payments arising out of total or partial closure of industries under BIFR orders were allocated. At the operation level, the NRF is divided into the national renewal grant fund (NRGF) and employment generation fund (EGF). The NRGF looks after the immediate requirements of labour in sick units. The funds will be disbursed in the form of grants to (a) assist employees affected by technology upgradation, restructuring, etc., and through approved schemes for retraining, redeployment and counselling, (b) compensation payments to employees affected by rationalisation of industrial undertakings, (c) VRS payments, and (d) interest subsidies to enable financial institutions to provide soft loans for funding labour rationalisation.

The EGF is used for approved employment generation schemes for both organised and unorganised sectors. This may include (a) special programmes designed to regenerate employment opportunities in areas affected by industrial restructuring, and (b) employment generation schemes for the unorganised sector in defined areas.

Both the categories of NRF will be in operation for a limited period of maximum 10 years. This is conceptualised as the insurance funds for employees. In order to operationalise the scheme, the department of industry, GOI, has identified a total of five agencies, including NGOs, to carry out the mandate of the NRF in five major locations where outflows of workers are considerable. They are Ahmedabad, Mumbai, Calcutta, Kanpur, and Indore. The ministry of labour through DGE and T has submitted a scheme for training of workers in 15 ITIs and six ATIs to cover 5,300 workers with a budget estimate of Rs 158.40 lakh. The identified nodal agencies in the 5 locations have started employee assistance centres (EAC) to help the rationalised workers through retraining, redeployment and counselling services. The Indian Council of Small Industries, Calcutta, is operating six centres in east India, including Visakhapatnam. One important thing that emerged out of this process is that an institutional approach has been initiated by the government to help the rationalised workers.

The NRF has now created a positive situation in the industrial economy of the country where several industrial undertakings are going in for the introduction of VRS in their organisations. Some of the employees are tempted to go in for VRS. Some sick units are declaring lay-offs and prompting the employees to approach NRF. This has been to a certain extent responsible for irrationalisation of workers. The workers are thrown out of employment on the basis of the obsolete nature of the labour skill which may not suit the undertaking in a changed situation. But, the undertaking is neither taking interest nor moral responsibility of retraining and rehabilitating the rationalised worker. The industry is pushing the responsibility on the government. The liberalisation policy in its anxiety to modernise, restructure and globalise the products of Indian industry is now wasting precious labour force which could have been modernised through retraining and on-the-job training. Precious skills and abilities of the retrenched workforce are equated with worn out physical capital which may not be susceptible to repair or modernisation. But human beings are capable of learning and are subject to modification of their knowledge, skills and application of these in producing more output. But the current euphoria for restructuring does not have the time to think on those lines. As a result, the number of rationalised workers is expected to increase. So far 75,000 workers have taken VRS, mostly in the textile sector as per *Economic Survey 1995-96*.

RATIONALISED WORKERS IN PUBLIC SECTOR

The VRS is popularly known as golden handshake. Extreme market competition and technological developments in industrial sector have brought in frictional unemployment. These changes have adversely effected groups and castes which are vulnerable to such sudden developments. On the basis of a case study conducted in Visakhapatnam, one of the industrially advanced cities of Andhra Pradesh, an attempt is made here to examine these developments.

There are 430 small and large industries located in the Visakhapatnam city with a capacity of 64,359 employees. Out of these, Visakhapatnam Steel Plant (VSP) alone employs 17,454. The VRS was introduced in public sector units (PSUs) in 1989. But it was effectively implemented from 1992 after the value of VRS amount was enhanced under the NRF policy. This has tempted many of the disadvantaged groups to opt for VRS as they were not properly oriented nor had they imagined about the long-term consequences of VRS.

Out of the total industrial units in Visakhapatnam, only PSUs are implementing VRS. There are 13 PSUs which have implemented the VRS so far. Two private units have been declared sick (see Table 2). In these 15 units, around 3,225 people have been affected by the NEP. The two private units became sick after 1991 due to extreme competition in the market and other reasons. A random sample of 10 per cent of the total workers affected by the NEP, which comes around 354, was collected. The analysis is made on the basis of the 353 (first excluded) sample size. A questionnaire was designed and the information collected from the following organisations: Hindustan Shipyard

(HSL), Visakhapatnam Port Trust (VPT), Hindustan Steel Works Construction (HSCL), Indian Oxygen (IOL), Marine and Communications Electronics (India MACE), Andhra University (AU), Bharat Heavy Plates and Vessels (BHPV), Dock Labour Board (DLB), and others.

The information relating to the VRS workers was collected from the organisation and the personal particulars from the workers at their residences.

Of the VRS workers there was only one employee from the ST category with SSLC qualification. He took voluntary retirement at the age of 53 from HSL as carpenter. There is no voluntary retired woman worker except from MACE, a sick unit of AF government (see Table 3).

TABLE 4: NUMBER OF DEPENDENTS IN THE VRS FAMILY (CASTE CATEGORYWISE)

No of Children	Community			Total
	SC	OBC	Others	
No Child	1 (2.2)	11 (6.6)	5 (3.5)	17 (4.8)
1	1 (2.2)	19 (11.4)	5 (3.5)	25 (9.3)

Note: Percentages in brackets.

TABLE 5: EDUCATIONAL STATUS OF VRS WORKERS BY COMMUNITY

Community	Educational Status						Total
	Illiterate	Below Matric	Matric and Above	Degree	PG	Technical Diploma	
SC	12 (13.04)	23 (17.97)	6 (6.82)	1 (4.54)	-	3 (14.28)	45
OBC	45 (48.91)	69 (53.91)	35 (39.77)	9 (40.91)	-	8 (38.10)	166
Others	35 (38.05)	36 (28.12)	47 (53.41)	12 (54.55)	2 (100.00)	11 (47.62)	142
Total	92 (100.00)	128 (100.00)	88 (100.00)	22 (100.00)	2 (100.00)	21 (100.00)	353

Note: Figures in brackets are percentages.

Out of the total of 354, 45 persons (12.71 per cent) belong to SC category, 166 (46.89 per cent) belong to OBC and the remaining 40 per cent belong to the other communities including the ones who have not specified their caste. Of the total 354 workers 62 per cent were employed in two major public sector units, Hindustan Shipyard and Port Trust. This shows clearly that majority of the affected workers belong to socially disadvantaged groups of SC and OBC in the PSUs. Though the representation of these communities in the existing employment structure does not reflect their proportion in population or the 50 per cent reservation quota, the retrenched VRS and sick unit workers are found to be more in proportion to the workers in the units due to the NIP. In their personal interview, workers informed that most of them were receiving a salary in the range of Rs 1,500 to Rs 5,000 per month at the time of VRS. As Table 4 shows 85 per cent of the workers have more than one dependent in their families; 73 per cent of SC workers' families have more than two dependents and 62 per cent of the OBC workers' families have similar status. Some of these dependents do not have sufficient educational background, making the VRS families among SC and OBC groups vulnerable to deprivation and destitution. The assistance offered to these VRS families is of limited use as most of them are past their prime and are not in a condition to pursue any wage employment. Further, most of them utilise the VRS money for marriage of their daughters or for getting education or employment in organised sector for their sons by offering bribes. Therefore, the NRF scheme hardly affords them a little investment required for self-employment.

The data regarding the educational background of the affected workers are presented in Table 5. It is noteworthy that not even a single post-graduate worker comes from socially disadvantaged groups. Out of the total illiterate workers, 30.04 per cent belong to SC, 48.91 per cent to OBC and 38.05 per cent to other communities. SCs constitute mere 6.82 per cent of workers with above matric qualification. There is only one graduate from SC. Among the technically qualified people 14.28 per cent are SC, 38.10 per cent are OBC and 47.62 per cent are from other communities. It is clear from this Table that majority of reserved category workers who are affected by the policy are technically qualified.

The most striking feature of the affected workers is that the socially disadvantaged groups who have entered the organisation with skills such as welding, carpentry, gas fitting, dipper feeder, fabrication, etc, have ended up in VRS after 10 to 25 years of service in the same cadre or a little higher, whereas those from other communities as those are retiring as fitter grade I, charge head, junior engineer, foreman, senior assistant, head typist, etc. This kind of upward mobility among the other communities vis-a-vis disadvantaged groups shows that there is discrimination in the promotion policies of

PSUs. Some of the VRS workers who are coming for retraining under NRF have complained that this invisible discrimination affects their prospects for promotion in the organisation where they are working. The atmosphere of discrimination and apathy towards the socially disadvantaged groups is also forcing most of the workers belonging to these groups to opt for VRS. Some of them are entering into their traditional caste occupations after securing VRS. In fact, reservations have not been implemented for OBCs in all the PSUs where the VRS is now being implemented. This means that the limited number of workers from backward artisan communities who entered PSUs on their own merit are now being thrown out of employment due to NEP. This is going to adversely affect the OBCs as the circumstances demotivate the younger generation to go in

for higher education and job employment.

The welfare of the working class is seriously affected by the NEP. The NRF introduced as a safety net has not been able to strengthen the economic conditions of the worker. Further, a peculiar situation of reverse class formation is taking place as most of the VRS workers are getting back to the original caste occupations for succour and security. This is the most adverse effect of liberal industrial modernisation on a caste-based society.

The SAP has resulted in job loss and income deprivation. The more serious aspect of this impact, as revealed from the case study, is that the socially disadvantaged groups of SCs and OBCs are severely affected. The NRF is now creating a situation in our social life wherein de-caste workers are being made conscious of their caste after opting for VRS.

UKRAINE

New Constitution Enshrines Right to Property

Stephen Steiger

By instituting the right to private property and entrepreneurship, the new Ukrainian constitution has removed the last vestiges of communist regime and paved the path to free market economy.

AFTER an unprecedented 23-hour session, the Ukrainian parliament adopted the country's first post-Soviet constitution on June 28, ending four years of resistance by the communists and averting a referendum called by president Leonid Kuchma. The new constitution guarantees the rights of private property ownership and entrepreneurship among other measures designed to establish a free market economy.

"Wisdom has triumphed today", the beaming president told law-makers after the prolonged applause that greeted the vote of 315 to 36, with 12 law-makers abstaining.

In one of the first official acts to bring Ukraine's public life into line with the new constitution, Kuchma nominated Pavlo Lazarenko as prime minister. Kuchma has unilaterally appointed Lazarenko as premier on May 28, under the extraordinary powers he was given last year under Kuchma's "constitutional contract" with parliament. The new 52-page constitution requires that the parliament must confirm the president's appointment of a premier, which law-makers did on July 10, approving Lazarenko by a vote of 344 to 22, with nine abstaining.

COMMUNIST VESTIGES REMOVED

By enshrining the separation of powers, individual liberties, and the rights to private property and entrepreneurship, the new charter eliminates the last legal vestiges of the communist power. "Until now, everything was temporary, fragmentary",

said delighted minister of justice, Serhiy Holovaty.

Ukraine's previous constitution dated from 1978 when the nation was still a Soviet socialist republic, and had been amended 20 times since the country gained independence in 1991. A draft of the new constitution was first introduced in 1992 but foundered on the controversial issues of executive powers, language, and property rights that were finally adopted four years later. The sense of legal impermanence in the interim had been a significant barrier to reform, sometimes in unexpected ways. Previously, for example, communist challenges to Ukraine's post-Soviet flag, approved by a majority vote in 1992, seemed timed to distract attention from economic reform legislation on the agenda.

But when the communists and their allies delayed review of the draft constitution in June by walking out on debates over language, Kuchma on June 26 called a referendum to circumvent the legislature and seek popular approval of the national charter. "This would have taken much longer without that pressure", said Vyacheslav Chornovil, leader of the rightist Rukh party which had backed the call for a referendum.

Besides enshrining the blue-and-gold flag and the trident as the state symbol, the new national charter proclaims Ukrainian to be the sole state language in the country of 52 million.

More directly related to economic reforms are the new provisions on property rights which were not even mentioned in the

previous constitution. Under the new one all forms of ownership are equal before the law (Article 13). The rights to ownership of land are guaranteed in Article 14.

Article 41 stipulates, "the right to private property as acquired in the manner set by law /and/ is inviolable. The forcible taking of objects of private property may occur/ only as an exception motivated by social necessity, in accordance with procedures set by law, and on condition of the previous compensation of their value. The forcible taking of objects of private property with the subsequent compensation of their value is permitted only in cases of war or state of emergency."

The constitution enumerates the rights of individuals to equal protection, free speech, movement, assembly, and conscience, and eliminates the singular political role 'worker collectives' had under the 1978 constitution. Soviet era rights to work, social security, housing, education, and leisure have been diluted.

A new 'right to entrepreneurship' has been added, and the constitution provides that the state is "obligated to protect competition", and that "abuses of monopoly status in the market, unfair restrictions on competition and unfair competition are banned".

SEPARATION OF POWERS

State power is divided among the legislative, executive and judicial branches.

The highest legislative organ is the 450-member parliament, the Verhovna Rada (supreme council) elected for a four-year term. Its authority includes passing the budget and overseeing its execution; adopting laws confirming the president's nominee for prime minister; and controlling the activities of the cabinet of ministers, including the option to vote no confidence. The legislature also approves foreign loans and confirms the president's nominees to head the national bank, the state property fund, the general prosecutor, and state television and radio. It may override presidential vetoes of legislation by a two-thirds vote.

The president may dissolve the legislature if it fails to convene a plenary session for 30 consecutive days.

The powers of the president who served as both the head of state and the country's chief executive under amendments to the previous constitution and last year's constitutional contract, have been trimmed. Under the new constitution, the president, elected for a five-year term is the head of the state while most executive duties belong to the cabinet of ministers. But there is a significant overlap between the two institutions. The president nominates the prime minister who must be confirmed by the parliament. But the president may dismiss the premier unilaterally, and also may rescind acts of the cabinet. On the premier's recommendation the president also appoints the rest of the cabinet.

While the cabinet's powers extend mostly to socio-economic issues, the president is the commander-in-chief of the armed forces and heads the council of national security, a body for co-ordinating and controlling

executive institutions involved in defence and security. The council also includes the prime minister, the head of the security service, and the ministers of defence, foreign affairs, and internal affairs. When issued as presidential decrees, the council's decisions have the force of law.

In case of treason or other crimes, a majority of the parliament may initiate impeachment proceedings. Two-thirds of the parliament must vote to indict, and three-quarters are needed to dismiss the president. If the president is dismissed, resigns or is incapacitated, most duties of the office fall to the prime minister.

The highest executive authority is the cabinet of ministers which includes, at a minimum, the prime minister, the first vice-prime minister, and three vice-prime ministers. The head of the cabinet is the prime minister whose resignation – whether voluntary or forced by a no-confidence vote by parliament or dismissal by the president – requires the resignation of the entire cabinet. This was not the case earlier when premiers resigned but the governments they headed often remained largely intact.

The president and the prime minister both may issue executive orders with the force of law. But in areas of foreign affairs, ministerial appointments, the military, national security, and decisions to dissolve the parliament, presidential decrees must be approved by the prime minister.

Nearly all economic issues – including the budget, taxes, market regulation, and government securities – are to be governed exclusively by laws, and are, therefore, the purview of the legislature. But during a transition period of three years the president may issue economic decrees confirmed by the prime minister on issues not already regulated by legislation.

In such an event the president must simultaneously introduce legislation on the subject of the decree in parliament. If the legislature fails to adopt the legislation, or if a majority fails to vote against it, the decree becomes law until parliament adopts legislation on the same subject.

Although president Kuchma had lobbied to make criminal prosecution a purely executive function, the constitution provides that the general prosecutor is nominated by the president and confirmed by the parliament. A Rada vote of no-confidence requires the prosecutor's resignation.

Judicial authority is given exclusively to the courts which are divided into two kinds: the constitutional court and courts of general jurisdiction. The former is the sole organ empowered to determine the constitutionality of laws and legal acts of the president and the prime minister, and to issue official explanations of the constitution. Courts of general jurisdiction are divided territorially and by speciality according to legislation.

ADVANCES IN TROPICAL METEOROLOGY

Meteorology and National Development

Edited by
Rattan K. Datta

Foreword by
N. SEN. ROY
President, Indian Meteorological Society

Hardbound

Rs. 950

The publication is based on the proceedings of the National Symposium on Meteorology and National Development organised at New Delhi by the Indian Meteorological Society in 1993. The symposium covered a wide range of subjects including Aviation Meteorology, Hydrology, Satellite Meteorology and Agricultural Meteorology etc.

The European Union

A Model for Regional Co-operation in South Asia?

Jakob Rosel

The gradual evolution of the European Union has coalesced into a myth where steadfastness, singularity of purpose and humility triumph against adversity. Against this teleological model, this article argues that contingent historical circumstances played important part in shaping the history of the EU. Though there are lessons to be learned from European integration, it will be naive to consider it as a model for south Asia, given the economic and demographic discrepancies within the latter.

CAN the European Union (EU) serve as a model for regional co-operation in south Asia?

This is one of those broad questions to which many answers are possible. This is because these answers will necessarily reflect what we view as the main achievements of the European Community, how we define a model and what we regard as possible in the field of regional co-operation in south Asia. Therefore I will not confront this question squarely. Instead I will approach it on a more devious route.

I will first demonstrate how the EU has evolved its own myth of creation, and how this myth is based on the belief that the European achievement can be replicated everywhere. In contradiction to this myth of creation I will show that the EU evolved in an unpredictable manner and that it is by far more unique and specifically European, than this didactic and simple myth of origin concedes.

While I dispute in Section I the exemplary character of the EU, in the second section I hope to demonstrate that although the EU can never serve as a simple model and blueprint to be transposed and imitated at will, we can at least derive some important lessons on the chances and constraints of supra-national co-operation from the European experience. Thus, while I reject the community as an empirical model, I will derive from its evolution some general insights into the capability of sovereign states to construct supra-national institutions and alliances. It is only in the third part and on the basis of these doubts and hopes that I will address the aforementioned answer directly.

I

Legends of the European Union

Parallel to its success and proportionate to its capability to fund research and to evolve its own mythology the EU has transformed its history into a success story, a historical drama and a lesson. In this legend of European integration we thus find

structural analogies to other canonised versions of historical adventures fulfilling the destiny of a nation or embodying the 'mission civilisatrice' of a state. In the European case we find at the beginning the contrast between a European history based on mutual antagonism and warfare and a European culture which gave rise to that threefold technical, economic and political transformation which gave rise to modernity. It is this stark dichotomy between Europe's continuing capability for self-destruction on the one side and Europe's ability to learn, to create and to transform, which serves as a background for the adventure of European integration. Here is an entire sub-continent – so we are told – which after second world war was capable to draw upon the best of Europe's creative traditions to exorcise and contain what was worst in its historical legacy.

Farsighted statesmen then entered the stage, first Jean Monnet and Robert Schuman, then Adenauer and de Gaulle which had been witnesses to Europe's destructive instincts and which were now willing and capable to redirect and contain these malign forces – of nationalism, militarism, protectionism and economic rivalry. These men – we hear – are no narrow ideologues, naïve visionaries or irresponsible idealists. Instead, these seasoned and responsible statesmen combine idealism with pragmatism. They base the ideal of European integration on the solid foundations of various economic complementarities between the European states, especially France and Germany. By redirecting and transforming their nations' economic interests they attempt to realise a political ideal: a pacified, democratic and prosperous Europe. A predominance of economic means over political ends, a step by step approach and a strategy of incrementalism thus lie in the centre of European integration. The same elements serve to characterise the official portraits of these statesmen which have been designed by 'the new hagiography emanating from Brussels.

If we study the lives of these prophets and apostles of European integration we therefore enter into a new pantheon shared by elder statesmen which were humble enough to accept compromise and to concentrate on economic detail but who never betrayed their common ideal. The drama which then unfolds from the 1950s onward also has a villain – the British – and its protagonists have to contend with two unprecedented political challenges: the menacing power of the Soviet Union and the dominating influence of the US [Nugent 1994:33-57].

Thus, before the ominous background of European history and against these new challenges the adventure of European integration begins. We all know the basic story. European integration starts in 1951 with the European Coal and Steel Community (ECSC), a customs union which is based on supra-national institutions, which are muddled by inter-governmental compromise. This high commissariat, council of ministers, court of justice and parliament served to the future economic community as precedent, they constitute the bud of the flower of European integration. The ECSC is based on the economic complementarity of French iron ore and German coal, a complementarity which Jean Monnet used to establish a customs union in which "war, would in future not only become unthinkable but materially impossible" [Swann 1992:6]. Unreflected and rash idealism then came to fall in 1954 with the failure of the project of a supra-national European Defence Community and European Political Community, until the chastened founding fathers returned to the pragmatism of building upon – still wider – economic complementarities to advance an economic integration for political ends. With the Rome Treaty of 1957 for a European Economic Community (EEC) the process of integration is finally initiated and since that time it has never stopped: as an economic success story, as an act of self-emancipation against the two superpowers and as a running theoretical debate between free traders and custom unionists [Holland 1993:22-57].

It is also with the Rome Treaty that the arch villain, the United Kingdom, enters the piece. In order to preserve its national and colonial interests the UK first tries to dissuade the six from founding the EEC and it then attempts to sidetrack the negotiations by propagating – belatedly – a European Free Trade Area (EFTA). By founding the EFTA the UK contributes in 1960 to the division of western Europe into two competing trading blocks, and by betraying its own organisation and joining the EEC in 1973, it transforms itself into an internal obstacle for further progress in integration. Yet despite the presence of this unrepentant 'saboteur'

European integration from now on – although in fits and starts – proceeds to ever higher level of economic interdependence and it succeeds on the level of a sub-continent. Profiting from its self-generated dynamism – new economies of scale, vested interests and institutional pressures – the community establishes a customs union (1967), implements a common market (1992), and now aims for a monetary union (1999). This success in climbing the ladder of ever closer economic integration leads to the emergence of an economic superpower which although speaking with many political heads increasingly transforms economic influence into political clout. Economic success thus initiates a metamorphosis which makes the political ends and ideals for which economic integration was started in the first place ever more explicit [Woods 1993:91-105].

Yet this success in vertical integration and transformation is accompanied by horizontal integration, by the continuing growth of the community of six to a community of 15. Through three stages of growth the community has demonstrated that it sticks to its principles – 1973: UK, Ireland, Denmark; that it rejects dictatorships and rewards democratisation – 1983/86: Greece, Portugal, Spain and that it (by now) offers not only indispensable economic opportunities but political guarantees – 1985: Sweden, Finland, Austria. Extension of the community thus did not obstruct; quite to the contrary, it facilitated growth. The evolution of the community resembles thus the flowering of a tree: from an unattractive kernel planted into barren ground it has by now grown into a majestic tree spanning half a sub-continent and resting on its own firm foundations [Swann 1992:21-47].

Seen under this perspective the growth of the community resembles the unfolding of a secular miracle: a drama where steadfastness, singularity of purpose and humility triumph against the forces of adversity. This historical drama confronts us with a spectacle where even the unrepentant are embraced and possibly re-educated, where the small and humble nations can withstand the seductions and threats of the superpowers and where a fallen subcontinent can come to terms with the sins of its past. There is thus certainly something to be learned from this secular success story and the drama of European integration – as set down in the aforementioned canonical version – does not neglect the practical lessons to be learned from the European experience.

By now nearly all the member states of the EFTA have joined the community. The debate, opened in 1957 by the UK on the effectiveness of a free trade zone as against the advantages of a customs union or a common market is therefore by now closed. In the eyes of the community there is no room for doubt that regional economic integration based on a customs union and

aiming for a common market are by far to be preferred to the rhetoric of generalised free trade and to regional free trade areas. In consequence, the European Community has persistently advised non-European, especially third world states to build their own regional trade organisations and especially customs unions. At the same time the community has insisted that by concentrating on economic co-operation and a pragmatic step by step process clusters of nations can lessen their political rivalries, increase their economic and political weight and thus defend or at least articulate their interests against the superpowers and major trading blocs [Buchan 1993:105-121].

Out of conviction or political expedience the community thus offers to third world countries its own past and experience as their future and possible destiny. On the level of official rhetoric and historiography the community thus believes in the possibility to replicate its own adventure and success among 'all sorts and conditions' of states. By overstating the challenges and dangers which European integration had to face and by understanding the resources, fortunate incidents and external assistance which facilitated integration, this picture of integration furthers a belief in its easy and possibly universal imitation. But is this official version of the community's growth correct? Several unwarranted assumptions determine the structure and content of this exemplary story. These assumptions are probably unavoidable when we want to enjoy the community's emergence as an intelligible, edifying and useful story. These assumptions are rhetorical devices which, not only in the European case, are used to transform history from a 'tale told by an idiot, full of sound and fury, signifying nothing' into something with a beginning, an end, a meaning and an order. It is therefore important to analyse and to qualify some of these central assumptions in the legend of European integration. Important assumptions used to structure the legend of European integration are the following:

- (1) The assumption of the power of new and original ideals to influence statesmen and shape history;
- (2) The assumption of a singularity of purpose which initiates and accompanies a specific historical development, and finally
- (3) The assumption of a dynamic and self-sustaining process of growth.

In short, these three assumptions imply a primacy of ideals over matter, of primordial conviction over contemporaneous context and of self-propelling change over established interests. The progress of European integration is thus structured by idealistic, teleological and structural suppositions, which may contribute to a good and didactic story but which must be qualified to a great extent. In the following, I will not attempt

to deconstruct the whole legend of European integration, instead (on the basis of some examples taken from the beginnings of European integration) I will try to demonstrate that European integration evolved in an unpredictable manner and was determined by constant changes, by day to day decisions and events. Only with the benefit of hindsight is it therefore possible to describe it as a continuous progress measured against a model of ever increasing macro-economic integration and on the scale of a sub-continent. Qualifying these assumptions thus leads to a more realistic understanding of the adventure of integration while it simultaneously undermines our belief that it can be easily imitated.

The belief in the power and originality of the idea of Jean Monnet and Robert Schuman to found a customs union for coal and steel products by now stands in the centre of the legend of European integration. Ever since the remains of Jean Monnet were transferred to the Pantheon in Paris and various Robert Schuman prizes, medals and anniversary ceremonies were instituted both statesmen have been transformed into the first prophets of European supra-nationalism and integration. But as new studies have shown, the idea of building a customs union for French and German steel and coal products had been propagated since the 1920s, if not before, and the idea of providing such a union with a supra-national framework again was not radically new. Instead, it was the moment at which Monnet's plan was launched, the deliberate vagueness of its content and its brilliant rhetorical form which guaranteed its success. Equally, Monnet had envisioned a supra-national commission and he was finally forced to accept an inter-governmental 'council of ministers', but the creation of a parliament for the ECSC at least at the beginning of negotiations had never entered his mind. So the basic institutional structure which characterised the ECSC and which was replicated in the European Community was the result of compromise not the consequence of a brilliant design [Tausch 1995:105-28].

Again, the power of a new idea to transcend and transform national interests can also be doubted. A whole array of different motives and considerations entered the plan of Monnet and Schuman all of which aimed not so much at European integration but on the reassertion of a dominant role by an impoverished and weakened France. The ideal of supra-nationalism and European integration was instrumentalised in the pursuit of an enhanced role and status for France on the continent. Monnet and Schuman were convinced that only with the help of a customs union the French steel industry could be forced to modernise, to expand production and to shed its protectionist habits. Not only should the customs union help to modernise French industry and to contain the re-emerging

German industry. As a custom union was completely unacceptable to the British, French politicians hoped that France, by leaning on a still weak West Germany, could reassert a dominant role on the continent. On the other side, Adenauer and the foreign office were keenly aware of the possibilities such a temporary convergence of interests would create for Germany's economic reconstruction and renewed political respectability. And it took more than 12 months to reach a compromise on the institutional framework of the ECSC and the negotiations were not exactly characterised by pan-European idealism.

Not only can the power and originality of pan-European ideas be put into doubt, equally doubtful is the teleological assumption about a singularity of purpose in engaging for European integration. Instead, an interest in furthering European integration waxed and waned with political circumstances and with new constellations of political interests and pressures. Thus, to give only two examples: the plan for a European defence community did not fail because it lacked a supra-national mechanism for political control. It failed in the main, because the French government, by now acutely aware of the insufficiency of its conventional military forces had decided to acquire in future a nuclear 'Force de Frappe', the control of which it did not want to share with a European defence organisation [Loth 1995:191-202].

Again, the definite decision for an independent economic community of the Six against the plan to combine this customs union with a free trade area comprising the UK and the remaining western European states was hastened by the final demise of the French fourth republic and chancellor Adenauer's resolve to oppose the adherents of free trade and critics of protectionism in his cabinet. The French prime minister Guy Mollet saw in the construction of a customs union the only means to develop the French industry and to secure new markets and financial resources – without British competition. Adenauer regarded the political benefits of the EEC as more important than the eventual hostility of the UK and criticism by the advocates of free trade. But even after the completion of the customs union, European integration experienced long periods of stagnation and it proceeded by fits and starts: if we study the various periods of a 'relance', we can always observe that the community evolves due to new, unforeseen and external pressures but not as a result of a preconceived plan – set out or implied in its Magna Carta, the treaty of Rome. The community does act always as a child of its times, not of its 'fathers' [Kusters 1995:203-40].

But if the community's progress is not determined by a singularity of purpose, by a common and pragmatic ideal shared by most of the European statesmen, is there at

least room for the belief that the community could continuously prosper and progress on the basis of its own success? This belief in the community's growing institutional weight, its self-generated growth and finally its irreversible tendency to expand seems by far the best theoretical device to explain as well as to structure the community's progress. Still there is room for doubt: conventional wisdom perceives in the centre of the community's institutions a bipolar relationship between the (supra-national) commission and the (inter-governmental) council of ministers. This is supposedly a relationship between a bureaucracy which has knowledge without power and an executive which exerts power without knowledge. To the degree that an evermore competent and informed commission threatened to influence and dominate the council of ministers, this executive was forced to embark on an institutional evolution of its own. To compensate for its lack of knowledge it had to build up its own bureaucracy, to withstand commission pressure it had to reorganise its proceedings with the new institutional device of the European presidency and the European council and in order to react to the growing pressures on decision-making it had to shift from unanimity to qualified majority voting. Growing competition between the commission and the council of ministers thus gave rise to a mutually reinforcing process of institutionalisation and bureaucratisation, which not only increased the authority and power of commission and council, but which integrated them in an ever closer net of competing as well as converging interests [Hancock and Peters 1993:474-83].

It is this closely intertwined institutional structure, which with the help of an increasingly authoritative court of justice and an increasingly influential parliament has generated those bureaucratic and political ambitions and has sustained those vested interests, which advanced further economic and political integration. But again this assumption which perceives *post factum* an – institutional – dynamic at work in European progress needs to be qualified. The European Community witnessed in the 1970s long years of stagnation and indifference and the acceleration in integration which we observe since 1986 was in the main initiated or enforced by impressive individuals – Jacques Delors – the accession of new members – Portugal, Spain – and by unpredictable political events – German reunification and the breakdown of the Soviet Union. Thus, it is not so much the interest of institutions and by now an institutionalised dynamic which enforces progress in integration, but context and circumstance [Buchan 1993:27-41].

Thus, in contradiction to the legend of European integration we might conclude that it was neither the power of an idea nor the persistence of an 'esprit européen' and not the dynamic of ongoing success which

initiated and sustained European integration. Instead – so we are tempted to argue – the community evolved in an improvised and largely unexpected manner and it was shaped by the general context of European politics and by specific events. And apart from that, till 1986 it evolved in a general fit of absent-mindedness.

But if the community is seen not as a result of an idea, a conviction and a self-sustaining dynamic but as the unpredictable and yet specific result of European political culture and development, it is hard to see how this unique consequence of European post-war evolution can serve as a model to regions and states with a completely different historical background. If the European Community cannot serve as a general model for regional co-operation, are there at least some lessons to be learnt from the European experience?

II

Lessons from European Integration

Supra-national political organisations in the ideal form of a federation of states derive their cohesion and autonomy in the last instance from those rights of sovereignty which their constituent states are willing to transfer to them. As the experience of so many intra-regional pacts, alliances or organisations demonstrates, weak as well as strong, insecure as well as self-confident states seldom concede national sovereignty in forms and degrees which will initiate irreversible and self-regulating processes of integration. There exists seemingly only one traumatic experience and self-generated constraint which can force states to transfer vast sovereign powers to a supra-national level. This is the experience of repeated and disastrous wars, wars which have finally led to a situation where the very survival of states, their basic identities, values and interests is at stake. Such a situation is outlined by Hobbes in an intra-state context and it was experienced in Europe after the second world war in an inter-state context. As outlined by Hobbes – for the case of religious civil wars – it is only under the threat of a possible continuation or recurrence of a war of mutual annihilation that the parties to this conflict will subject themselves to an external peace keeping power or that they might be willing to transfer rights and resources to a new and higher authority. Yet, in the European case, the insight into Europe's continuing capacity of self-destruction and the experience of having been transformed from a centre of global power into a battleground of two new and antagonistic global powers at least at the beginning, led only to a limited response on the part of some of the western and democratic European states. Prodded by the US and enlightened by a desperate self-interest, after years of experimentation, the founding members of the European economic community were

willing to concede strictly circumscribed economic powers to a supra-national European organisation to make "war not only unthinkable, but materially impossible". Economic means were thus employed for unstated political ends: the democratic stability and the political reassertion of western Europe. As this example demonstrates, even under the best – or the most pressing – of circumstances independent states will not easily relinquish sovereign rights to ensure their political survival or reconstruction, consolidation or development. For other independent as well as antagonistic states, the European experience thus leads to an obvious conclusion. Short of a major catastrophe these states might not enter into an initially limited but in the long term irreversible process of far-reaching economic and possibly political integration. Yet, as the European experience also demonstrates, such a process if initiated can create its own logic and incentives [Soulier 1994:370-83].

At the beginning, supra-national bodies like the European economic community are motivated by and initiated through the interests at self-preservation of states. Now, to the degree that the loss of state sovereignty is recompensated through gains in the stability, wealth and authority of the respective states there might emerge a broad political consensus to exchange additional rights or degrees of sovereignty against such prospective political gains.

The concessions of national sovereignty are now no longer seen in a zero-sum game perspective, they are seen as investments into a mutually profitable process. This new incentive to engage in supra-national integration can be better understood if we distinguish between the independence, the sovereignty and the strength of a state: Independence could be defined as the capability of a state to pursue, without interference, to the fullest possible extent its interests in the widest possible range of sectors. Sovereignty, in contrast, could be described as the political ambition and the legal entitlement of a state to engage in this pursuit of its interests. Strength finally would mean that quantum of power which is available for this pursuit of interests, practice of independence and realisation of sovereignty.

On the basis of this description it is easy to see that a restriction of national sovereignty through interstate integration – in diverse areas as technical, economic, military or political integration – can lead to an increase in – technical, economic, military or political – strength, which again contributes to greater independence in various other sectors. Thus, through the concessions of specific and clearly circumscribed rights of sovereignty to supra-national institutions a process can be initiated which by increasing the strength of a state, diversifies as well as enhances its independence. Not only this, the same process of a concession of rights will in the long run

contribute to the redefinition, development and differentiation of the concept and content of sovereignty [Franck 1990:9-10].

Yet, for such a process to succeed there must exist – apart from political circumstance and consent – a legal tradition, expertise and competence, which will sustain and safeguard this process. There is certainly reason to assume, that the process of European integration was increasingly driven by the experience of the constituent states, that, what they lost in terms of specific and circumscribed sovereign rights, they regained in terms of technical, economic, military or political strength and *de facto* independence. Thus, the European experience leads to an ambiguous conclusion: European integration – leading to the possible political reassertion of Europe as an actor in international relations – has been determined by the persevering, although enlightened, interests of single states. The success of European integration on the one side therefore rests on the strengthening of supra-national institutions, on the other side it has resulted in the strengthening of its constituent states. Far from marginalising and eroding the single state – 'weakened by tribalism and globalism' [Huntington 1993:22] – the European Community has been initiated by and it has simultaneously largely profited single states [Hancock and Peters 1993:508-22].

As already outlined, the emergence of autonomous and powerful supra-national political organisations rests on the willingness of sovereign states to transfer substantial rights to such an organisation. As states – at least to the present days – were always reluctant to concede such rights, such organisations – including the European Community – must of necessity enact laws, regulations and norms, for which they lack the ultimate power of sanctions. New supra-national institutions remain dependent on the willingness of states to conform to new modes and expectations of behaviour, which these institutions are allowed to prescribe, but in the last instance cannot enforce. But this intrinsic difficulty and structural instability of supra-national institutions must not necessarily accompany and finally obstruct ever closer integration. Instead, the growing success of integration can create new constraints and incentives which even in the absence of powers of sanction, will enforce conformity.

It is obvious that in every voluntary association – be it of individuals or states – the degree of mutual obligations and of self-imposed norms, enforced and indirectly defined by sanctions cannot be higher than the degree of disadvantages, which results from the – voluntary or involuntary – withdrawal from this group. Growing disadvantages thus increase the scope for sanctions and for the imposition of new and more restrictive norms. The same relationship can also be described in positive terms: to

the degree that members of this association derive increasing advantages from group membership, they will accept ever more stringent rules and they have to conform to ever more restrictive norms. The success of inter-state integration, the creation of new advantages and benefits, thus operates as the driving force which facilitates the enactment of new rules, secures conformity and contributes to increased cohesion. Now from this rather abstract set of conditions and determinants some additional benefits and strategies will follow.

If the aforementioned association will expand, if it wants to admit new members, it can impose on every new member that level of rules and norms, that degree of conformity, which it has by now attained. The association of states therefore can, possibly from the start, embark on the dual course of increased 'vertical' integration – the setting up of new norms and regulations – as well as 'horizontal' expansion. This horizontal expansion, the admittance of new members will in its turn transform the cost-benefit calculations of outsiders and potential insiders. This is, because successful expansion, the admittance of new members, will in the long run narrow their options: very soon, outsiders might be placed in a position, where they can no longer enter into the respective group on their own terms, where there are no outsiders left with whom to form an alternative association and where to remain independent will mean to face increasing isolation and disadvantages. Yet, these structural and normative effects of an increasingly successful integration, will not only accelerate expansion and deepen cohesion and conformity, the same effects will also offset to a certain degree the always present and potentially rising costs resulting from non-conformity or from the so-called 'free riders'.

As long as the benefits resulting from increased (vertical) integration and (horizontal) expansion are perceived as to outweigh the costs accruing to the association from the presence of 'free riders' – through calculated non-conformity or through unavoidable imbalances in contributions and benefits – such integration and expansion can continue. Increasing diversity in composition; in conformity of behaviour or in capability to contribute, will thus accompany but it will not necessarily undermine the development of the respective association. Yet, to the degree that increasing integration, expansion and benefits result in new chances and needs for the enactment of more and detailed regulations and norms, this legislative challenge must of necessity enforce a process of further institutionalisation.

Now – as the European community institutions show – this process can take many directions and it can assume diverse forms, yet, what is important is the fact that

institutionalisation tends to make a certain level of integration irreversible. Institutionalisation establishes bureaucratic specialists, which have a vested interest in further integration, which have the expertise to fully exploit the need for and the chance of further regulation and legislation. In addition, institutionalisation will lead to the establishment of courts, which although they lack the power of sanction, are by now well endowed with an authority to sentence. Successful integration, thus, can result in institutions which although devoid of power begin to control their own resources, accumulate knowledge and exert authority. In consequence, these supra-national institutions can to an ever greater degree influence the political perceptions of the various state governments, they might manipulate their choices and they will operate as third parties. Successful supra-national integration has by now – so we might conclude – generated its own dynamic, its own incentives, institutions, personnel and rationale. In other words, supra-national integration is not only successful, it is by now probably irreversible and it can impress itself on the public mind as a success: it thus can no longer be ignored. Yet, to the degree that supra-national integration is by now perceived as permanent, it is this perception which in its turn tends to consolidate as well as to advance integration [Nugent 1994:85-121].

To the degree that supra-national economic or political integration is perceived as a new yet enduring social order, ever larger sections of the society by now have to take account of this new economic or political framework. Political strategies, economic expectations or personal decisions will be based on the assumption of the continuing existence of this order. By ascribing permanence to this order these individuals, sections or societies will contribute to its stability. It now rests on the interests of the few or the inertia of the many, it has been incorporated into the realm of personal planning and public anticipation. Yet, due to the same process supra-national integration will not only operate as an element of planning but also as a field for investment. The same individuals, sections and societies will invest in social, economic or political terms into this new framework, which they by now regard as permanent. This investment into the stability and future of the new order will further increase its solidity and strength. Successful, increasingly institutionalised, and by now highly visible supra-national integration thrives on public awareness and it benefits from the collective assumption that it will last and that to invest in this order is both necessary and profitable. This new order is not yet seen as legitimate, only as inevitable. But in all probability people who begin to ascribe permanence and utility to this order, will in future ascribe authority

and legitimacy to this new structure [Popitz 1992:221-27].

I will not further prolong these rather simplistic remarks on the difficulties and chances on the way to supra-national integration. For the case of European economic integration many cases might be cited, when rather unexpectedly these difficulties could be overcome and these chances exploited. Yet, although the until now unique European experiment has led to an undeniable success in economic integration, it is still far from giving the European Community a common political voice. Thus, even under the best of circumstances the difficulties preventing supra-national political integration still outnumber the chances for such integration.

III Can South Asia Learn from the European Integration?

I have tried to demonstrate that in contrast to the didactic legend of European integration it is difficult to see how the EU can serve as a clear-cut model for south Asian regional co-operation. On the other side we have seen that the European experience at least demonstrates that fully sovereign states are perfectly able to construct supra-national institutions and that they might gain new political strength and economic power through a calculated loss or delegation of sovereignty. Yet, at the same time our description has shown that enlightened self-interest at least in the European case was not enough to initiate this calculated process. At least in the European case, the experience of a devastating war, the menace of an expanding superpower and the discrete prodding by an allied superpower were necessary to push the European states in the direction of their supposedly obvious interests.

Integration was further facilitated by a unique historical moment and political and military balance. A conquered and humiliated Germany had to accept this plan of future integration while a victorious but weak France was willing and able to offer it. Extraordinary circumstances and a rare and already shifting balance of power coupled with a complementarity of economic interests thus facilitated the experiment of European co-operation and integration. It is hard to find any analogies to this set of fortunate circumstances and factors in the south Asian arena. Most importantly, we find a completely different balance of economic and political power.

The 'Big Four' – France, (West) Germany, Italy and the UK – which have largely influenced the community, had roughly the same demographic and territorial weight, and what differentiated them in economic power, they would compensate in military strength, historical status or cultural pretensions. At the centre of an expanding community we thus find several and mutually

balanced states. This is not the case in south Asia. Using the European Community as a frame of reference a south Asian (economic) community would resemble a European Community in which Germany – India – would constitute the sole and central big power, surrounded not by several major, but only a restricted number of smaller states. Pakistan would play the role of Belgium – one-eighth of Germany's population – Bangladesh the role of backward Greece, Sri Lanka and Nepal would operate as Denmark and possibly Austria, and the Maldives Islands might act the role of Luxembourg. It is easy to see that these smaller European states would in the absence of major powers never have contracted a marriage of convenience even with a weakened and conquered Germany. Thus, south Asia – so we might conclude – can certainly derive some insights from the European experience in supra-nationalism, but it is hardly conceivable – given the huge discrepancies in demographic and economic weight – that south Asia can construct a customs union or a common market.

Textiles and Industrialisation

Tirthankar Roy

New Silk Roads: East Asia and World Textile Markets edited by Kym Anderson; Cambridge University Press, Cambridge; pp xxvi+245.

FEW sectors illustrate the industrialisation process in all its stages as well as the textile industry. Distinct literatures on long-run economic change – development theory, comparative advantage, 'stages of growth' tradition in economic history – intersect in their use of the common example of textiles. This is due not only to the importance of cloth as a consumption good irrespective of levels of income, but also to the fact that historical and contemporary evidence allows certain broad but remarkably stable cross-country generalisations about the role of textiles in industrial development. The following six perhaps constitute the core set of these 'stylised facts'.

(1) Dispersed comparative advantage: Fibres, yarn, fabrics and clothing are among the most widely dispersed and extensively traded commodities in the world, which suggests that nearly every country, rich or poor, has comparative advantage in some textile-related activity. (2) Leading exportable: Textiles have been the 'leading sector' and leading export in the early stages of development, almost without exception if we look at relatively resource-poor and labour-abundant economies. The principle validated is that such economies have a comparative advantage in labour-intensive manufactures. The importance of trade in early development is buttressed by the fact that in a large number of cases, the rate of export growth exceeded that of GDP growth during industrialisation. In theory, growth does not have to be export led. A country like India with a large home market can provide a different option. But in practice the inelastic need in a poor country to import food, input or technology leaves little choice. (3) Inverted-U: The share of textiles in exports and incomes follows an inverted-U shape when plotted against time or GDP per capita. The pattern, however, emerges only with industrial maturity. Country-share in world exports and 'export-specialisation' indices follow a similar inverted-U pattern but, for any single country, all these indices do not necessarily coincide. (4) Overlapping inverted-U's: The inverted-U's overlap when we look at early- and late-industrialisers together. Comparative advantage in textiles passes on as relative resource-costs and learning profiles change. Countries once net exporters turn into net importers. Britain and

major textile producers of western Europe faced their turning point in the 1930s. Japan did in the 1960s. The east Asian NIEs in the mid-1970s. We are now at points fairly high up in the inverted-U's of China, Thailand, south Asia and several other smaller developing-country exporters. (5) Lingering comparative advantage: In the downward phase in mature economies, comparative advantage rarely disappears. Rather, it moves out of certain sectors to certain others within textiles which are more capital- and knowledge-intensive. Typically, advantage lingers on in fabrics more than yarn and clothing, manmades more than natural fibres, industrial fabrics more than apparels and in high-speed or high-precision machinery. Even within clothing, comparative advantage lingers, in Italy and France for example, in garments which utilise flexible specialisation, organisational resources which matter to innovation and marketing and are relatively capital-intensive. The downward journey of the inverted-U, in other words, involves not just decline, but diversification, rationalisation, organisational change, greater R and D and, typically, substantial state intervention to direct or stabilise the restructuring. And, finally, (6) increasing intra-industry trade: It follows from (4) and (5) that all countries, whether net importers or net exporters, tend to trade within textiles more heavily over time.

East Asia displays all of these processes in the hundred years that span Japan's rise in the last quarter of the 19th century and China's in the last quarter of the 20th. In between, Japan, and partially Hong Kong, Korea and Taiwan, completed the inverted-U. The 1980s, and largely the 1990s as well, however, represent a very different time from that when the 'take-off' began in the NIEs. For one, protection in the main markets has increased and another, the sheer scale of China's presence raises a variety of questions, especially those about market access of other suppliers. The latter includes some of the world's poorest countries, such as those in south Asia.

The book under review has three basic objectives, to illustrate the processes which relate textiles with trade and development, to examine the effects of trade regimes on east Asian textile producers and to assess what China's rise means for global trade and

production. South Asia is of marginal interest in the essays compiled here, but clearly the general issues are of great relevance for India. The book contains nine articles presented in a seminar jointly held by two Australian universities in 1989. The conclusion of the Uruguay round has added new questions to those addressed in this volume, but that does not detract from its usefulness as a reference. On the contrary, there is great deal here relevant to speculations about the future.

The essays are divided into two groups. The first, consisting of contributions by Kym Anderson, Young-II Park and Suphat Suphachalasai, sets out certain general propositions about comparative advantage relevant for textiles and, in that light, draws lessons from the experience of pre- and post-war Japan, post-reform China, Thailand in the 1980s, and historical evidence in general. The general lessons are already embodied in the six stylised facts above. These lessons are not matters of serious disputation. But it does seem at points that the discussion here somewhat overstates the abstract comparative advantage mechanism and under-emphasises differences of an institutional nature, in organisation or learning, of the sort invoked in the textile history of India and Japan to explain the former's retreat and the latter's rise in the Asian yarn market at the turn of the century. Of particular interest are certain specific issues discussed such as prospects of sustaining China's self-sufficiency in fibres which has been one force behind its export performance, and the set of factors which led to the dramatic rise of Thailand from the mid-1980s.

The second set of essays deal mainly with the markets for east Asian textiles. The topics are China's prospects in the presence of MFA (John Whalley), adjustments in Japan (Hidcki Yamawaki), demand and trade policy in Europe (Carl Hamilton), the US (Joseph Pelzman) and Australia and New Zealand (Peter Lloyd). The essays supply a useful descriptive history of the regime, discuss the substantial research which estimated the levels and costs of protection, differences between importing countries in the operation of the regime and between exporters in their response. One common theme is that MFA has been a 'porous barrier' in restricting scale of imports from any specific source, though it indeed has affected production strategies and location (by encouraging FDI for example). The implication is that the phased withdrawal of MFA might affect these strategies more than the scale of trade. The essays do speculate what the medium-term future might look like. The forecasts

cannot be very specific, but point out several factors that can shape the future. One point of interest is that, with or without global trade rules, Europe is likely to maintain a 'pyramid of privileges' with respect to its main transactors, in which hierarchy much of Asia belongs in the lower tiers. Another is that China's surge may be constrained by the increasing pull of the home market and by fibre availability. Both conjectures have an echo in, and seem to be validated by post-1985 Indian trends – which reminds one of the many points on which India and China are comparable: scale and diversity, home

generation of fibres, etc.

For a south Asian readership, the absence of such comparisons might seem like a potentially instructive area left undeveloped. That apart, one wished for greater concern in the essays with textile machinery, inclusion of which would make the general propositions relating textiles with industrialisation richer and more nuanced. These are, however, minor qualifications. The book is an essential reference and a source of much useful information on the recent past for an Indian researcher interested in a comparative perspective on the industry.

The Second Transition: Family Welfare to Reproductive Health

S Irudaya Rajan

Population Policy and Reproductive Health edited by K Srinivasan, 1996; Hindustan Publishing Corporation, New Delhi; pp 361, Rs 450.

THE book under review is a collection of papers presented at the seminar on 'Policy Direction and Strategy for Action in Population and Reproductive Health in India' held at New Delhi, December 19-20, 1995. This seminar was organised as part of the Silver Jubilee celebrations of the Population Foundation of India (earlier known as Family Planning Foundation), which was established in 1971 by a group of industrialists including late Bharat Ratna, J R D Tata.

Bharat Ram, chairman of the Foundation, writes "If we could have succeeded in limiting the population to 700 million level in place of the existing 938 million, the per capita food availability would have risen by 87 per cent, malnutrition would have been largely warded off. The 36 million applicants figuring in live registers of unemployment would have nearly disappeared." India, as a signatory to the recommendations of the International Conference on Population and Development at Cairo and also the International Conference on Social Summit at Copenhagen, and International Women's Conference at Beijing, has to make necessary changes in the family welfare programme. As a first step, the government of India has lifted all targets on family planning methods and is taking measures to improve the quality of services, says K Srinivasan, executive director of the Foundation and the editor of this book.

The volume has three sections: (a) Demographic scenario; (b) policies and programmes and (c) political leadership, international comments and recommendations.

Overviewing India's demographic transition since 1970, K Srinivasan presents different dimensions of fertility and mortality regimes existing among different states.

Major states such as Assam, Gujarat, Haryana, Kerala, Madhya Pradesh, Maharashtra, Orissa, Tamil Nadu, West Bengal, have shown fertility decline much faster than mortality decline. The decline in fertility did not match with the mortality in the following states: Andhra Pradesh, Bihar, Karnataka, Punjab, Rajasthan and Uttar Pradesh. There has been a substantial decline in fertility during the period from 1972 to 1992; crude birth rate declined by 28.3 per cent (from 40.7 in 1972 to 29.2 in 1992), total fertility rate by 36.8 per cent (from 5.7 to 3.6). Moreover, 67 per cent of reduction in fertility is attributable to marital fertility indirectly supporting the success of family planning programme. Marital fertility changes have contributed to more than 90 per cent in the states of Gujarat, Haryana and Kerala.

K B Pathak assesses the fertility transition using the latest National Family Health Survey (1992-93) and the report prepared for the Rockefeller Foundation, New York, by F Rock et al, 1995. While the fertility transition in Kerala was initiated in early 1960s, the female literacy was as high as 45 per cent, IMR was as low as about 90 per 1,000 live births and the age at marriage of females was 19 years. Interestingly, states like Rajasthan, Uttar Pradesh, Bihar and Madhya Pradesh have not yet achieved such level of social development but fertility transition not only has begun but it is much lower than what Kerala had at the time of onset of fertility transition. In rural India, the proportion of higher order births (four and above) declined from 47 per cent in 1972 to about 25 per cent in 1991. As high as 50 per cent reduction in higher order births is a big achievement of the family

planning programme. The age at last birth among rural women has declined by seven years and they may account for the decline in TFR of more than two children per woman.

The best and the most comprehensive paper in this volume is by P N Mari Bhat. Mari Bhat has not only provided us with indirect estimates of fertility for all districts of India but has also assessed the quality of data provided by the Sample Registration System and the National Family Health Survey. This paper is an extension of a paper [Bhat, 1994]. In its assessment of fertility trends during the 1970s, the panel on India [Bhat, Preston and Dyson 1984] had come to the conclusion that the SRS was underestimating both the level of fertility and the pace of decline. The panel also suggested that TFR levels had come down from 5.6 in 1971 to 4.7 births per woman in 1978, or nearly one birth decline per woman in about seven years. Thus, the SRS had significantly underestimated the intercensal growth in population as it was undercounting more births than deaths.

The evidence suggests that total fertility has declined from a level of 5.6 births per woman around 1971 to 4.7 at around 1978. After stagnating for quite some time at this level, it has fallen to 3.7 around 1991. Another important source, the NFHS, indicates a much rapid decline in the 1980s than either the census or the SRS, but its evidence probably flawed from backward displacement of births of older women in the survey [Bhat 1996]. Thus Mari Bhat argues the NFHS evidence on the recent Indian fertility trends has to be rejected.

The article also provides the estimated birth rate and total fertility rate for 326 districts in 14 major states in 1981 and 362 districts in the same states in 1991 along with 17 smaller states and union territories. The level of fertility has varied from a high of seven births per woman in a tribal district of Madhya Pradesh to a low of about 1.6 children in a cluster of districts in southern Kerala and north-western Tamil Nadu. A total of 15 districts in India (including the two in Goa) had reached below replacement level of fertility by 1987 but 23 districts still had TFR levels of six or more. Between 1977 and 1987, two-thirds of the districts had moved to a lower TFR class interval or experienced roughly a decline of one birth or more in total fertility. The pace of fertility decline was slowest in districts with TFR levels between five and six in 1977 among whom less than half moved to a class interval of under five births per woman. For the first time in India, all panchayat level information is available to the data users statewide within a short period of time through computers. This micro data can be used for the effective panchayat level planning. We hope the

panchayat raj institutions will exploit the information and bring glory to the panchayats [Irudaya Rajan 1996].

Near replacement level of fertility in the state of Tamil Nadu with a population size as large as Thailand, has been a matter of considerable debate because in levels of females literacy and child survival the state is nowhere near that of neighbouring Kerala nor is it economically as prosperous as Punjab or Haryana in the north. However, Mari Bhat argues that the state's position is extremely favourable on two accounts – mass media exposure and joint family – which are found to be crucial in explaining the spatial variation of fertility in India. There are three broad explanations offered in the literature for the fertility decline in Tamil Nadu, namely, poverty, programmatic effort and backward class movements in the state [Kulkarni et al 1995; Anthony 1992; Srinivasan 1995; Kishor 1995]. We think, along with backward class movements [Eugene Irschick 1969; Pandian et al 1991], the exposure to mass media and the preponderance of joint family system are responsible for the low fertility in Tamil Nadu. Befittingly, the district from where Periyar (the most virulent campaign against brahmins and leader of the Self-Respect Movement) hailed from, and now goes by his name, has the lowest level of TFR in Tamil Nadu (1.6).

M S Swaminathan and colleagues of the M S Swaminathan Research Foundation, Madras, argue for a greater degree of decentralisation for implementing the family planning programme. Draft national population policy prepared by the expert group on population policy on the advice of the ministry of health and family welfare, suggested in the planning process by adopting the principle "think, plan and act locally and support nationally". Mahatma Gandhi often reminded us that rural India will stagnate economically as long as the drain of brains and resources from the village to the town and cities continues. In a recent paper, Gulati and Bhide have calculated that 1 per cent switch in terms of trade in favour of agriculture would lead to an income transfer Rs 8,500 crore at current prices (NCAER working paper, 1993). Considering that the present level is adverse to the extent of over 10 per cent compared to 1971-72, the new agricultural policy of the government of India which assures parity between industry and agriculture, if implemented will result in the transfer of Rs 85,000 crore (at current prices) annually to rural areas. This single step alone will enable panchayats to undertake additional resource mobilisation within the villages to implement everything including fertility policy.

T V Antony provides us an illustrative account on reproductive achievements between Kerala and Uttar Pradesh using the

NFHS. On the one extreme is Kerala, with a singulate mean age at marriage of 22.1, IMR (5-year average) of 23.8, female literacy level of 82.4, antenatal care level of 97.3, reproductive span (difference between median age at first and last birth) of 8.1 years, an average birth spacing of 34.9 months, and consequently a CBR of 20.3 and TFR of 2.09 [Zachariah and Irudaya Rajan 1996]. On the other extreme is Uttar Pradesh with a singulate age at marriage of 18.3, female literacy level of 31.5, antenatal care level of 44.7, IMR of 99.9, an average reproductive span of 14.2, an average birth spacing of 32.1 months and consequently a CBR of 37.9 and a TFR of 5.19. For quite sometime, it was the fashion to talk about the success of Kerala. Now the focus is on Tamil Nadu. Next demographers in India will be dealing with Andhra Pradesh. Andhra Pradesh with its low age at marriage, high infant mortality rate and low female literacy, yet for some strange reasons, with a CBR declining sharply from 30.3 in 1987 to 24.1 in 1993. A fall of six points in six years! There is need to develop a south Indian demographic model.

This volume also contains some articles which are repetitive and contains no new ideas or information. However, the volume contains valuable papers which are of interest not only to population policy planners but also to state and panchayat level planners. As it contains the current levels of fertility of all the districts in India, it should be a reference volume and kept in the district collector's office for an effective implementation of fertility policy.

Indices of Industrial Productivity Growth

Disaggregation and Interpretation

J Mohan Rao

This paper studies productivity trends in Indian industry on the basis of a particular scheme of disaggregation. The disaggregated productivity measures are then suitably aggregated to provide a revised index of productivity for Indian manufacturing.

The author's scheme of disaggregation divides organised manufacturing into sub-sectors by the criteria of ownership (public versus private) and enterprise size (small versus large). This disaggregation is intended to eliminate some major potential sources of aggregation bias and to shed light on the public/private and small/large dichotomies that have featured among the main lines of the Indian debate concerning industrial performance and policy.

Finally, the paper also aims to reconsider the conventional interpretation of total productivity measures in terms of supply-side factors alone.

I Introduction

IN a previous paper [Rao 1996], we developed a procedure appropriate to the construction of an index of total factor productivity (TFP) when output is reckoned in value-added terms and applied it to the case of the organised segment of Indian manufacturing. That paper also proposed a method for relaxing the assumption of perfect competition in product markets. The principal conclusion that emerged was that there was a transition in the early 1980s from a high positive rate of trend growth in productivity to a significant negative rate, a result contrary to Ahluwalia's (1991) conclusion, based on deflating value added only by the output price, that the trend shift was from negative to positive productivity growth. Our result is broadly in conformity with the conclusion of Balakrishnan and Pushpangadan (1994) although their measure of productivity growth, based on separately deflating output and material inputs by their respective price indices, also suffers from significant measurement bias.

These attempts at measuring manufacturing productivity all operate at a high level of aggregation involving manufacturing as a whole save the unorganised segment which falls outside the scope of the *Annual Survey of Industries*, their common source of data. A measure of aggregation bias is inevitable in all such studies based as they are on broad surveys: even disaggregation up to the enterprise level cannot help if only because many enterprises produce a mix of products rather than single homogeneous products. Surveys that are fine-tuned to pick up data for precisely delineated production activities will, in practice, likely fall short of the required ideal. But at least in the Indian case,

the ASI data themselves reveal pronounced variations within organised manufacturing in respect of wage rates, profit rates and techniques that cannot be ignored. While the severity of these variations depends on the particular scheme of disaggregation one considers, the variations are assuredly non-random and call for a disaggregated analysis of productivity to the extent feasible. A major purpose of the present paper is to study productivity trends in Indian industry on the basis of a particular scheme of disaggregation. The disaggregated productivity measures are then suitably aggregated to provide a revised index of productivity for Indian manufacturing.

The scheme divides organised manufacturing into sub-sectors by the criteria of ownership (public versus private) and enterprise size (small versus large). This disaggregation has a dual purpose. One is to eliminate as closely as is possible what we believe to be some major potential sources of aggregation bias. The other is to shed some light on the public/private and small/large dichotomies that have featured among the main lines of the Indian debate concerning industrial performance and industrial policy. The ASI data have not, to the best of our knowledge, been previously employed to this effect.

The third aim of the paper is to reconsider the conventional interpretation of total productivity measures in terms of supply-side factors alone. We argue that this interpretation – treating growth accounting as a branch of supply-side economics – is generally untenable. This is not to say that the productivity measures themselves are without value. Rather, these measures provide an informative starting point for a more considered analysis of the determinants of industrial performance which would

include not just conventional supply-side factors but also such phenomena as external economies from learning and the dynamic division of labour on the one hand and, on the other, variable rates of capacity utilisation and growth of resources that derive from demand constraints or inducements. We employ the productivity indices developed here to present some evidence in support of this general argument.

The plan of the paper is as follows. Section II considers the divergence in estimates that have been obtained in the Indian case when different procedures for aggregating outputs were employed. It then demonstrates that growth accounting at an aggregated level will yield biased estimates of productivity when factor prices are not identical across included production units – such bias can be eliminated only if appropriate disaggregation is undertaken. Section III considers the sources of heterogeneity relevant to the organised segment of Indian industry. It makes a case for disaggregating by size and ownership and the method by which disaggregated data for manufacturing can be gotten from industry data available in the ASI. Important data limitations that remain in implementing our proposal are also underlined. Section IV reports the results on disaggregated productivity trends. The disaggregated indices are then aggregated to get the productivity index for manufacturing. The biases due to inappropriate aggregation are presented together with those due to inappropriate deflation of value added, the former tending to be considerably smaller than the latter. Section V evaluates the supply-side interpretation of accounting-based growth decompositions and furnishes some evidence in support of external economies and/or demand-side influences on measured productivity.

FIGURE 1: INDICES OF MATERIAL INPUT TO OUTPUT BY SUB-SECTORS

price. The production function is the technological relationship between inputs and a homogeneous output with a single price. If heterogeneous outputs have their own distinct technologies, input qualities and input prices, then, there exists no 'production function' of the aggregates of such heterogeneous outputs and inputs. Any such aggregate 'production function' will reflect the particular composition of sub-sector outputs (and their associated inputs) prevalent in a particular year and shifts in this function over time will be an unidentifiable mix of real productivity changes in the sub-sectors as well as the changing composition of the aggregate output. Aggregated growth accounting is implicitly based on the construct of such an aggregate production function. Hence, if output heterogeneity is recognised, then, the generally proper procedure would be to (1) determine total factor productivity growth (TFPG) for each sub-sector separately and (2) determine the TFPG of the manufacturing sector as the weighted sum of the TFPGs for sub-sectors with weights equal to the real output (value-added) shares of the sub-sectors in some base year. However, if input prices and qualities are identical across all sub-sectors, it is shown below that aggregated growth accounting will yield the same results as this disaggregated procedure. In all other cases, any measure of TFPG obtained from output and input aggregates will be biased. Whether such bias is systematically large or negligibly random over time cannot be predetermined.

II Aggregation under Input and Output Heterogeneity

A distinction needs to be made between aggregating outputs and inputs across heterogeneous sub-sectors on the one hand and positing an aggregate production function across such sub-sectors. Conventional index numbers can be constructed of course to provide aggregative measures of outputs. For example, the value of output for each sub-sector is deflated by its own output price index and the results aggregated across the sub-sectors to provide an index of real output for the manufacturing sector as a whole. The aggregate index can then be used to define growth rates as well. Input measures such as total employment or capital invested are, however, usually obtained as simple sums of the component levels.

However, if outputs are heterogeneous in the first place (were they not so, there would be no need to carry out the above-described aggregation), then, an aggregate production function cannot be posited unless inputs are homogeneous in terms of both quality and

FIGURE 2: INDICES OF PRODUCTIVE CAPITAL TO GVA BY SUB-SECTORS
(At constant prices)

The points made above can be concretely illustrated for the Indian case. Consider the two most extensive studies of productivity growth in Indian manufacturing [Goldar 1986 and Ahluwalia 1991]. We leave aside the problem of inappropriate deflation of value added which afflicts both studies. Goldar provided TFPG estimates for small-scale factories and for large-scale factories (including electricity generation) by deflating the respective aggregate values of outputs by the manufacturing wholesale price index.¹ If P_{it} and Q_{it} represent output price and quantity for the i -th sub-sector in year t , then, the aggregate Laspeyres' price index P (the manufacturing WPI with base weights) is given by $P_t = \sum P_{it} Q_{it} / \sum P_{i0} Q_{i0}$ and $P_0 = 1$. Using P as the deflator, the output index is given by

$$Q_{Gt} = \frac{\sum P_{it} Q_{it}}{P_t} = \frac{\sum P_{it} Q_{it}}{P_{i0} Q_{i0}} (\sum P_{i0} Q_{i0}) \quad \dots(1)$$

Since $Q_{G0} = \sum P_{i0} Q_{i0}$, when base prices P_{i0} are set equal to one we have

$$Q_{Gt} = \frac{\sum P_{it} Q_{it}}{\sum P_{i0} Q_{i0}} (\sum Q_{i0}) \quad \dots(2)$$

Thus, Goldar's procedure for aggregation yields an output index that weights base and current period component outputs by

their *current prices*. By contrast, Ahluwalia chooses to deflate sub-sectoral (2-digit level) output values directly by their respective wholesale price indices. Thus, her output index for the i -th sector is given by $Q_{Ai} = P_{i0} Q_{it} / (P_{it} / P_{i0}) = P_{i0} Q_{it}$. Setting base period prices to 1 gives $Q_{Ai} = Q_{it}$. Her measure of aggregate output is given by $Q_{At} = \sum Q_{Ai} = \sum Q_{it}$ or, equivalently, by

$$Q_{At} = \frac{\sum Q_{it}}{\sum Q_{i0}} (\sum Q_{i0}) \quad \dots(3)$$

Comparing equations (2) and (3) makes clear that Ahluwalia's procedure gives the correct index of aggregate output whereas Goldar's output index will capture not just output changes but also the effect of changing prices of component outputs.² To put it differently, the growth rate of Goldar's output index is the weighted sum of sub-sector growth rates, where the weights are output shares at *current* prices; the growth rate derived from Ahluwalia's index is a similar weighted sum but with weights being output shares in the *base* period.

These divergent procedures for determining manufacturing output yield (single-deflated) productivity measures that are substantially different. For the 1960-80 period, Goldar's estimate of TFPG is +1.2 per cent per annum whereas Ahluwalia's estimate is only -0.4 per cent.³ Should we conclude, then, that Ahluwalia's TFPG estimates are more reliable than those of Goldar (and of Balakrishnan and Pushpangadan 1994 and Rao 1996)? By the argument made at the outset of this section, Ahluwalia's procedure is also not error-free unless input qualities and prices are uniform across all sub-sectors.

To see this, let V_i be real value added in the i -th industry obtained by separately

FIGURE 3: PRODUCTIVITY INDICES, PUBLIC MANUFACTURING

deflating current value added by the respective price index. To set aside the problem of the incorrect deflation of value added, we may assume that output is produced without any material inputs so that value added and gross output are equal.

Aggregate value added V_T and its rate of growth $g(V_T)$ are given by

$$V_T = \Sigma V_i \text{ and } g(V_T) = \Sigma s_{iv} g(V_i) \quad \dots(4)$$

where s_{iv} is the share of the i -th industry in total real value added. All studies of

productivity growth in Indian manufacturing obtain aggregate factor inputs as the simple, unweighted sum of sub-sector inputs, i.e., homogeneity of factor qualities is assumed. Thus, total capital stock is $K_T = \Sigma K_i$ and total labour input is $L_T = \Sigma L_i$. It follows that factor input growth rates are given by

$$g(K_T) = \Sigma s_{ik} g(K_i) \text{ and } g(L_T) = \Sigma s_{il} g(L_i) \quad \dots(5)$$

where s_{ik} and s_{il} stand for the share of the i -th industry's capital and labour inputs respectively in their respective aggregates.

Abluwalla then proceeds to derive TFPG for aggregate manufacturing on the basis of output and factor growth measures given by (4) and (5) and factor shares computed from aggregate data on value added and emoluments of employees. Let α_T stand for the share of aggregate labour in aggregate value added. Then, TFPG_A, Ahluwalla's measure of TFPG in manufacturing is given by

$$TFPG_A = g(v_T) - \alpha_T g(L_T) - (1 - \alpha_T) g(K_T) \quad \dots(6)$$

In view of the aggregations in (4) and (5), this can be rewritten as

$$TFPG_A = \Sigma \{s_{iv} g(V_i) - \alpha_T s_{il} g(L_i) - (1 - \alpha_T) s_{ik} g(K_i)\} \quad \dots(7)$$

Clearly, this procedure first identifies heterogeneous outputs but then goes on to posit an aggregate production function whose constituents are aggregated output and inputs.

But if outputs are heterogeneous, then, the general presumption is that their production functions are distinct. Thus,

$$V_T = \Sigma V_i = \Sigma G_i(L_i, K_i, t) \quad \dots(8)$$

where the G_i are sub-sectoral production functions. The growth decomposition of (8) yields

FIGURE 4: PRODUCTIVITY INDICES, PVT-LG MANUFACTURING

$$g(V_T) = \sum \frac{V_i}{V} \{ \alpha_i g(L_i) + (1 - \alpha_i) g(K_i) + TFPG_i \} \quad \dots(9)$$

where $TFPG_i$ is the rate of growth of total factor productivity in the i -th industry. Let $TFPG = \sum (V_i/V) TFPG_i$, i.e., the weighted sum of the component $TFPG$ s. Then, we get the following expression for $TFPG$ from (9).

$$TFPG = \sum s_{iv} TFPG_i = \sum s_{iv} g(V_i) - \sum s_{iv} \{ \alpha_i g(L_i) + (1 - \alpha_i) g(K_i) \} \quad \dots(10)$$

Thus, whereas $TFPG_A$ is derived from aggregate output, aggregate inputs and aggregate input shares, $TFPG$ is derived as the weighted sum of the $TFPG$ of the component industries.

Consider now the difference between the two measures of productivity growth in (7) and (10). After some simplification, we get

$$TFPG_A - TFPG = \sum \{ s_{iv} \alpha_i - s_{ik} \alpha_i \} g(L_i) + \sum \{ s_{iv} (1 - \alpha_i) - s_{ik} (1 - \alpha_i) \} g(K_i) \quad \dots(11)$$

It follows that the two measures give the same results if and only if the following

conditions hold:

$$s_{iv} \alpha_i = s_{ik} \alpha_i \quad \text{and} \quad s_{iv} (1 - \alpha_i) = s_{ik} (1 - \alpha_i) \quad \text{for all } j \quad \dots(12)$$

The first of these conditions may be expanded from the definitions of the relevant shares as

$$\frac{V_i}{V_T} \frac{w_i L_i}{V_i} = \frac{L_i}{L_T} \frac{\sum w_i L_i}{V_T} \quad \text{for all } j$$

$$\text{or} \quad w_i \sum L_i = \sum w_i L_i \quad \text{for all } j \quad \dots(13)$$

where w_i is the wage rate prevalent in the i -th industry. Clearly, condition (13) holds only if the wage rate is identical in all industries. Similarly, the second of the above conditions holds only if the profit rate is identical in all industries. In all other cases, the aggregation procedure adopted by Ahluwalia will lead to a biased measure of $TFPG$. The equality of factor prices across Ahluwalia's disaggregation (at the 2-digit level) demonstrably fails to hold in the ASI data. Hence, her measure of $TFPG$ as well as all other extant measures (including the author's own aggregated index for manufacturing) incur a bias.

Condition (12), in the case of labour, can also hold when wage rates are not uniform across industries provided the share s_{ij} of the j -th sector in aggregate labour input is taken not in physical terms but in value terms, i.e.,

$$s_{ij} = \frac{w_j L_j}{\sum w_j L_j} \quad \dots(14)$$

In effect, the labour input share of the j -th sector is taken in efficiency units (the wage implicitly providing the efficiency weight). Similarly, in the case of capital, when profit rates are not uniform across industries, the share s_{jk} of the j -th sector in aggregate capital input is taken not in physical terms but in value terms, i.e., the sector-specific capital rentals provide the efficiency weights. In short, taking the weighted average of $TFPG$ is equivalent to computing aggregate $TFPG$ directly but on the basis of the price-weighted sums of component inputs. The weighted input aggregates can be thought of as input levels in efficiency units. Ahluwalia's procedure correctly excludes the influence of output price variations but excludes, incorrectly, the influence of input price variations as well.

In other words, Ahluwalia goes only half the way toward disaggregation. While output heterogeneity (in physical and price terms) within manufacturing is correctly recognised, it errs in constructing $TFPG$ estimates from growth decomposition based on an aggregate 'production function' which ignores factor heterogeneity. Given the wide divergence in factor prices across sub-sectors, to deflate component value-added separately and then to estimate $TFPG$ from their aggregates is theoretically inconsistent and will produce a bias. Goldar's procedure, on the other hand, implicitly assumes that output is

FIGURE 5: PRODUCTIVITY INDICES, SMALL MANUFACTURING

homogenous at the chosen levels of aggregation. His procedure is therefore theoretically consistent: aggregate TFPG is constructed from an assumed production function in which real output is obtained from deflating the value of output by an aggregate price index and taking, in effect, the mean wage as the marginal product of labour (and similarly for capital). But it is liable to be empirically flawed to the extent that there is genuine heterogeneity and diverse trends in output and input prices across the sub-sectors (this, of course, seems presumptively true as a quick perusal of the WPI or wage numbers across manufacturing sub-sectors reveals). The wide divergence between Goldar's and Ahluwalia's estimates of TFPG seems due principally to their different aggregation procedures and both estimates may be subject to potentially serious aggregation biases though the source of bias is different in each case. This conclusion also applies, of course, to the estimates due to Balakrishnan and Pushpangadan, and Rao.

But going half the distance is not necessarily better than going no part of the

distance. Ideally, biases on the output and input sides can only be eliminated by following the procedure outlined above, i.e., constructing sub-sectoral TFPGs and then taking an appropriate weighted average of these (or equivalently, by weighting sub-

sectoral factor growth rates in value or efficiency terms). Given the accounting procedure based on single deflation adopted by both Goldar and Ahluwalia, there are *no data problems* to carrying out the correct disaggregation. In the following two sections, we seek to implement, as best as we can, the disaggregation procedure noted here *together* with the deflation procedure discussed in Rao (1996). This exercise is, however, constrained by available data.

III Sources of Heterogeneity

Heterogeneity within the organised segment of Indian manufacturing may be identified along at least three dimensions: the commodity composition of manufacturing, the size distribution of enterprises and ownership type. Ideally, disaggregation along all three dimensions is desirable but due to resource limitations, we confine our exercise to the size and ownership criteria. We believe that these two axes likely capture much the most important sources of heterogeneity (which we discuss below), especially as some of the main divisions along the first dimension are known to be significantly related to either size or ownership. Our purpose is both to limit aggregation bias in measuring productivity trends for the sector as a whole and to provide a theoretically meaningful disaggregation. From the latter standpoint, there is a large body of literature that has debated performance of the public sector relative to the private and of small enterprises relative to large. To be sure, a great deal of truly 'small' manufacturing occurs outside of the organised segment covered by ASI.⁴ Nonetheless, there are significant differences along the size dimension even within the organised segment that warrant the tack we have adopted.

TABLE 5: TOTAL FACTOR PRODUCTIVITY GROWTH RATES

FIGURE 6: AGGREGATED TFP INDICES, MANUFACTURING

The ASI data are available in disaggregated form for various size classes of enterprise (size being measured in terms of both capital invested and employee strength) and for certain ownership categories (including public, private and joint ownership). However, this disaggregation is available for all of *industry* which includes *manufacturing* proper, repairs and utilities (electricity, gas and water). To isolate the manufacturing sector from industry and simultaneously secure the size-and-ownership disaggregation, we have adopted the following course. First, rather than deal with the entire size distribution, we confined our attention to a simple dichotomy of 'small' and 'large' enterprises. Small enterprises are defined as those employing between 10 and 99 employees (firms with less than 10 employees are not covered in the ASI) so that large enterprises form the residual employing 100 or more employees.⁴ Second, we assume that all utilities are confined to the large sector. Far and away the largest part of output and capital in utilities is concentrated in electricity generation where our assumption seems to be entirely appropriate. Errors of classification cannot be ruled out but are likely to be negligible.

But we made no similar assumption as regards 'Repairs' as that would be clearly erroneous.⁵ Hence, in the disaggregation that follows, the term "manufacturing" includes the repairs industry. For the 1973-92 period, the mean share of repairs was 1.6, 2.4 and 0.7 per cent (of the corresponding total for manufacturing+repairs), in terms of nominal value added, employment and (real) productive capital employed respectively. This should be borne in mind when considering the disaggregated results discussed in the next section. Third, we also

assumed that all public sector enterprises are confined to the 'Large' category, an assumption that is virtually beyond doubt. Note that from these three steps we may deduce that 'Small (Private) Manufacturing' is simply 'Total Industry' less 'Large Industry'. Fourth, we took the innocuous step of including the joint sector in the private sector so as to isolate a public sector that is entirely publicly owned. Finally, to sort out the share of the public and private sectors in utilities, we relied on the CSO's published information on 'Net Domestic Product from Public Sector by Industry and by Type of Authority'. The public sector's NDP derived from 'Electricity, Gas and Water Supply' as per the CSO, constituted 93 per cent of the total net value added from utilities as per the ASI (this is the mean value for the period 1973-74 through 1984-85). Therefore, we split ASI utilities between the public and private sectors in the ratio 93:7. Though this is an approximation involving two different sources of data, there is no reason to doubt its veracity. The upshot of these assumptions may be stated succinctly and with obvious notation as follows:

$$\begin{aligned} \text{'Small-L-Mfg'} &= \text{Total-Ind} - \text{Large Ind} \\ \text{'Public-Mfg'} &= \text{Pub-Ind} - 0.93(\text{Utilities}) \\ \text{'Pvt-Lg-Mfg'} &= \text{Large-Ind} - \text{Pub-Ind} \\ &\quad - 0.07(\text{Utilities}) \\ \text{'Total-Mfg'} &= \text{Total-Ind} - \text{Utilities} \end{aligned}$$

with the qualification that "manufacturing" here connotes manufacturing proper plus repairs. Hereafter, the component segments of manufacturing will be called 'Small', 'Pvt-Lg' and 'Public'. Tables A1-A3 present the ASI data, together with the real capital stock estimates, for the three sectors.⁷

What are the sources of heterogeneity within this classification of organised manufacturing? There can be little doubt that it captures part of the heterogeneity of output (and associated input mixes). Even where the 'same' product is manufactured in the large and small sectors, there are likely to be differences in quality.

Note: Bold-faced coefficients are statistically significant at the 5 per cent level.

More important, there is also a division of labour into even broader categories of manufacturing among the small, public and pvt-lg sectors that derive either from government policy of reservation and licensing or from market restraints and incentives. Product market structure can also be expected to be correlated with production specialisation. There is reason to believe that pvt-lg firms will generally command greater ability to fix output prices compared with small firms. By contrast, while public firms may have a similar ability to fix prices, their prices are more likely to be administered by government for political, macro-economic or social reasons. These differences imply not only that our classification will capture some of the production function differences within manufacturing but also that the importance of correcting the conventional productivity measure for product market monopoly power (see Rao 1996, for details) will also vary by sector.

A second major source of heterogeneity arises from systematic segmentation in the *factor markets*. In the labour market, there are two aspects to this segmentation: variable skill composition and variable wages for the same skills. The error of aggregating 'employees' without regard to skill composition is at least partly avoided in our disaggregated analysis for average skill levels are doubtless higher in the public and pvt-lg sectors than in the small. Table 1 (first three columns) shows the product wage for the three sectors over the study period.* The mean product wage over the period was 2.57 times as large in the public sector as in the small sector and 2.1 times as large in the pvt-lg sector. Whether these differences reflect human capital differences alone or market 'imperfections' as well is not relevant here. What matters is that the differences are far from negligible and aggregates of employment and mean wage rates will miss quality and/or price differences relevant to growth accounting. Although wage trends (based on semi-log regressions) in the public and pvt-lg sectors were fairly similar, the product wage in the small sector (in relation to the product wage in the other two) rose considerably faster (1.7 per cent per annum versus 0 per cent) through 1980-81 and significantly slower (3.3 per cent versus 3.9 per cent) in the remainder of the study period.

The last three columns in Table 1 show the differences in profit rates. The mean profit rate is only about 12 per cent higher in the pvt-lg sector compared to the small but 172 per cent higher than in the public sector. Even if public enterprises do not maximise profits, the sort of growth accounting exercises undertaken here and elsewhere in the literature must necessarily

assume that enterprises minimise costs (at least in the sense of achieving production efficiency). Given this assumption, the observed profit rate differences may then be attributed to capital market 'imperfections': the public sector has access to funds at below-market rates. The apparently small difference in profit rates between the small and pvt-lg sector may also hide a complex set of factors rather than revealing a reasonably efficient capital market. For example, profit rates in the pvt-lg sector are notably greater than interest rates on long-term capital available from the organised financial system and may reflect monopoly returns. The small sector must be distinguished from the pvt-lg not only by the expectation that they would have less power to fix prices in goods markets but also by the expectation that they would have less access to organised finance. The latter consideration suggests that measured profit rates in the small-scale sector may well be high, perhaps even higher than in the large sector but as a reflection of capital market segmentation rather than of market power. Over the study period as a whole, the profit rate in the public sector grew at the exponential rate of 2 per cent per annum whereas profit rates in the private sectors show no statistically significant trend.

A final source of heterogeneity arises from differential *access to technology* in conjunction with factor (and product) market segmentation. In positing a common production function across sub-sectors, aggregate growth accounting implicitly assumes a perfect market in technology so

that all enterprises have competitive access to it. But if technology markets are imperfect, then, the segmentation of product and factor markets, will support the coexistence of diverse enterprises with access to diverse technologies (not just diverse techniques).¹⁰ From a production standpoint, the enterprises in effect operate in virtually distinct economies (distinct technologies, product markets and factor markets). Put differently, there is reason to believe that there is a *structural* simultaneity between the set of techniques available to different groups of firms and the factor prices they face (this goes beyond the simultaneity, implied by profit-maximisation, between *techniques* and factor prices). Absent this link, we could include all observed techniques to represent the economy-wide technology. Otherwise, aggregation will be founded on a mongrel technology. Since our disaggregation includes both public and private, large and small enterprises, some of this differential in access to technology will be captured.

The Goldar and Ahluwalia studies cited earlier are based on the single deflation of value added which introduces its own error (as demonstrated, for aggregate manufacturing, in Rao 1996). This error can be corrected by following an appropriate time-dependent procedure for deflation. However, if we wish simultaneously to correct the aggregation biases of past studies, we are confronted with a data limitation. The problem is that the correct procedure for deflation requires data on output and material input prices (a problem not confronted until

the contribution of Balakrishnan and Pushpangadan, hereafter B-P). The former are available at the aggregate and 2-digit levels but not for the disaggregation adopted here. While a usable form of an input price index has been constructed at the aggregate level by B-P, no such usable input price index is available at the disaggregated level. To construct the latter requires not only relevant input price series (which are indeed available) but also data on the material input mixes at the sub-sectoral level. In short, the implementation of the correct deflation procedure confronts no data problem at the aggregate level. However, to implement that procedure at the disaggregated level, we have to deploy uniform output price and material input price indices or not disaggregate at all.

If the disaggregation attempted is itself of a very low order (which is the case with the scheme adopted here since the small, pvt-lg and public sectors are themselves diverse and large aggregations), then, it is arguable that the bias introduced by the use of uniform output and material price indices would also be of low order. Also, the fact that material inputs constitute close to 80 per cent of the value of manufacturing output may be argued to lead to offsetting errors from the uniform price indices (to the extent that material price changes are passed through into output prices). We hasten to add that this does not mean that the disaggregation attempted here is error-free. But as long as the relevant data problem continues to bind, a less-than-ideal disaggregated analysis may nonetheless have some value -- if only to suggest caution in the use of growth accounting to draw strong and otherwise uncorroborated inferences about manufacturing performance either at the aggregative or disaggregative levels.

IV Disaggregated Productivity Growth, 1973-93

Table 2 presents partial input intensities (or partial productivities) for the sub-sectors of organised manufacturing. First consider material input intensity, measured as the ratio of the value of material inputs to the value of output. In current price terms, Table 2 (first 3 columns) shows that the small sector was considerably more material-intensive than the public or pvt-lg sectors. In both of the large-enterprise sectors, but especially in the public sector, there was a significant rise in current-price material intensity in the first half of the study period. Figure 1 graphs the indices of material intensity in both current and constant price terms.¹¹ A comparison of the current- and constant-price intensities (the unbroken and broken lines respectively) shows, in fact,

that the real material intensity of the private sectors (small plus pvt-lg) fell significantly through 1983-84 and rose equally sharply thereafter. For the public sector, real material intensity rose sharply in the two years after the oil shock of 1973 but thereafter followed a trend that roughly parallels the trends in the private sector. Since the output-to-material-inputs price rose significantly through 1982-83 and fell thereafter, the latter trends may be taken to reflect substitution away from materials though they may be due also to changing output composition.

Table 2 also shows the current-price capital-to-value-added ratios and the labour-to-value-added ratios for the three sub-sectors. The small sector had higher capital intensity than the pvt-lg sector in all years through 1987-88 and higher labour intensity throughout. Similarly, the public sector was considerably more capital-intensive than the pvt-lg sector although the differential narrowed somewhat over time and more labour-intensive throughout with the differential widening considerably toward the end of the study period. But direct comparisons of total 'efficiency', based on these numbers, are precluded because the labour inputs are unadjusted for quality differences and product and product market characteristics may also not be comparable. There is also a contrast in the trend of capital intensity (at current prices) between the public and pvt-lg sectors. Through the late 1970s, capital intensity fell in the pvt-lg sector but rose in the public. By contrast, it rose in the pvt-lg sector the 1980s but fell considerably in the public. These differences

underline the need for disaggregation of total productivity measures.

At the same time, the strong trend shifts in the material-to-output price relative during our period render such current-price trends and comparisons of capital intensity highly misleading. Figure 2 graphs the constant-price capital intensity of value added obtained by taking productive capital at constant (replacement) prices and value added at the implicit price appropriate to converting nominal into real value added (as explained in Rao 1996). It shows a U-shaped trend in the two private sub-sectors. But observe that the rise in real capital productivity in the first phase was sharper in the small than in the pvt-lg sector and the fall in real capital productivity in the second phase was considerably greater in the pvt-lg than in the small sector. Capital intensity shows greater fluctuations in the public than in the private sectors. The public sector did not experience any noticeable rise in capital productivity until the early 1980s when it saw a rather steep rise. Following significant fluctuations between 1982-83 and 1988-89, the public sector registered a steeper fall in capital productivity than the private sectors due, no doubt, to the cumulative and current effects of liberalisation.

Lastly, observe that although labour productivity has clearly increased in all three sectors by fairly wide margins, much of this increase occurred by the year 1982-83. The fall in labour intensity was steepest for the pvt-lg sector and considerably lower for the public sector.

These observations on partial productivities present a combined picture

broadly consonant with the picture that emerged in the analysis of aggregate manufacturing (in Rao 1996). That is, significant gains in productivity occurred via reductions in material input, capital and labour intensities in the first decade or so of the period. These gains were at least partly reversed in the second decade. But there are noticeable differences in the extent of these gains and losses across the three sub-sectors which can only be combined and specified with precision by means of total factor productivity growth measures to which we now turn.

Tables 3-5 present the principal results from growth decompositions for the sub-sectors as well as for aggregate manufacturing. Table 3 shows the TFP indices, based on the exact, double-deflation and single-deflation procedures, and gross output indices for the sub-sectors. Figures 3, 4 and 5 graph these disaggregated productivity indices for the public, pvt-lg and small sectors respectively. TFP* is the productivity index based on the deflation procedure laid out in Rao (1996). When this is corrected for product market monopoly power, we get TFP*(M).

The mean markup rate (in terms of the output price) over marginal cost for the whole period was 10.3 per cent for the pvt-lg sector, 6.0 per cent for the small sector and 0.0 per cent for the public sector.¹² Hence, the monopoly correction makes no difference on average in the case of the public sector and TFP*(M) is not reported. For the pvt-lg sector, TFP*(M) varies between a low of 91 per cent and a high of 111 per cent of the corresponding TFP* index value whilst, for the small sector, the said variation was between 95 per cent and 116 per cent. The monopoly correction makes a clear difference in the measure of TFP for these two sectors; therefore, only TFP*(M) is reported for them.

In Table 4, TFP* (weighted) represents the weighted sum of TFP* for the public sector and TFP*(M) for the private sectors with weights being these sector's share in aggregate real value added. The table also incorporates the unweighted TFP* and the double- and single-deflated TFP indices (TFPDD and TFPDD) for aggregate manufacturing (these are from Rao 1996). It should be recalled that the weighted index is for manufacturing + repairs whereas the three unweighted indices are for manufacturing alone. The weight of the repairs industry, however, is too small to cloud comparisons of these indices. Figure 6 graphs these indices for aggregate manufacturing.

Table 5 reports semi-logarithmic trend growth rates for the productivity indices for the whole period as well as for two sub-periods (1973/74-1980/81 and 1981/82-

1992/93, hereafter 'Period 1' and 'Period 2' respectively). This periodisation is adopted solely to check Ahluwalia's (1991) central conclusion that there was a break in the trend of manufacturing productivity around 1980-81 following reforms in industrial and trade policy.¹³

It should come as no surprise that the broad trends in the TFP* indices, for the sub-sectors and for manufacturing as a whole, follow the above-described trends in the partial productivity indicators. For the period as a whole, total factor productivity grew at an annual average rate of 2.3 per cent in the public sector, 2.2 per cent in the pvt-lg sector and 2.4 per cent in the small sector (though the growth coefficient for the small sector was not statistically significant). But there are important contrasts across the two periods that deserve to be noted. In Period 1, the respective growth rates were 3.7, 5.9 and as much as 10.0 per cent for the three sub-sectors. In Period 2, the rankings were reversed with the small and pvt-lg sectors registering annual rates of decline of 5.3 and 2.0 per cent respectively and the public sector recording -1.8 per cent growth per annum which was in fact not statistically significant. The basis for these contrasts can be located in the significant differences in trends noted earlier in terms of capital productivity and material intensity across the sectors. But caution is needed in taking these contrasts at face value in view of the use of a common output and input price indices for all sub-sectors. For example, it is conceivable that administrative price increases may have been large enough to produce significantly faster increases in

public sector output prices compared with the private sectors output prices in which case productivity growth, by our measures, would be overstated for the public sector and, because public sector prices are part of the manufacturing WPI, understated for the private sectors.

The substantial deceleration in productivity growth observed for all three sectors is reversed with the single-deflation measure. Productivity growth accelerated from annual rates that were not significantly different from zero in period 1 to 2.2, 0.9 and 2.3 per cent for the public, pvt-lg and small sectors. It is also notable that the Period 2 ranking of the three sectors is the opposite of that obtained from TFP*.¹⁴ By contrast, TFPDD does conform with the chief result (based on TFP*) of a deceleration in productivity growth between the two Periods though the magnitude and in some cases the sign and significance of the growth rates are scarcely the same.

The weighted TFP* for manufacturing grew at 2.3 per cent per annum for the whole period (see Table 5), decelerating from 6.5 per cent in Period 1 to -2.8 per cent in Period 2. The corresponding numbers for the unweighted TFP* for manufacturing are 2.0, 5.5 and -2.2 per cent respectively. These growth rate differentials (also clearly visible in the gaps between the respective graphs for TFP*, weighted and unweighted, in Figure 6) are an index of aggregation bias when an aggregate production function is posited without suitably weighting inputs for efficiency (price and/or quality) differentials. But it is reassuring to note that the two indices do not conflict at least

TABLE A3. OUTPUT AND INPUTS
(Small Manufacturing, 1973-74 - 1992-93)

as regards the trend shifts in productivity between Period 1 and 2 are concerned.

For manufacturing as a whole, the contribution of productivity growth to value added growth was 38 per cent for the study period and, 61 per cent and -124 per cent respectively for Period 1 and Period 2. Productivity growth contributed a larger share of value added growth in the public than in the private sectors – the contributions being 46 per cent for the public, 37 per cent for the pvt-1g and 31 per cent for the small sector. Taken by themselves, these numbers look respectable by (conventionally measured) international standards. However, by the same token, the contrast between the two Periods makes the respective productivity growth rates exceptionally large (in absolute terms) by these same standards.

The differentials between TFP*, TFPDD and TFPSPD are clearly noticeable in Figure 6. For most of the period, there is an interesting 'progression from TFPSPD to TFPDD and then on to TFP* (unweighted) and TFP* (weighted) – each revision shifting the graph upward. But the biggest source of error is attributable to single-deflation relative to the correct procedure for deflation, the error produced by double deflation being substantially smaller in sign and magnitude. At least for the sample data, we may conclude that errors due to inappropriate aggregation are small relative to the errors due to incorrect deflation of value-added.¹⁵ This is also a reason for reposing greater confidence in the general conclusion that productivity growth fell between the two periods than the contrary view that it rose. But 'greater confidence' should not be construed to mean 'beyond reasonable doubt': a measure of caution is warranted by the limitations of data, particularly the unavoidable reliance upon uniform price indices with a fixed base for outputs and inputs.

V Growth Accounting as Supply-Side Economics

If we take the results of this paper and its predecessor at face value, we are left with a difficult problem of interpretation although the difficulty is by no means unique to this study.¹⁶ However the periodisation be arranged, the exercise reveals a significant rate of decline in measured total factor productivity in the 1980s. From a neoclassical standpoint, TFPG must be viewed as a measure of supply-side productivity improvements. Besides technical progress, improvements in the quality of outputs or of inputs are certainly consistent with such a view. But when TFPG is negative, this implies a corresponding rate of technical regress. But in what sense can there be

technical regress of such high order? Workers and engineers forgetting their skills or losing their knowledge at such a rate seems implausible if not absurd just as output quality deterioration over time is.

We single out three candidate variables by way of a general answer (without necessarily implying their applicability in the empirical instance studied). First, productivity may be lost on account of specific supply bottlenecks such as in infrastructure or imported inputs. Second, productivity may decline in the face of protracted conflict, at the subterranean level of the shop floor if not in overt forms, between labour and management. Third, the utilisation of labour and capital may suffer on account of the inability of producers to sell additional output due to demand constraints.

The supply-side oriented interpretation cannot encompass the last of these variables as there is no neoclassical conception of demand-constrained capacity utilisation. With perfect competition assumed to hold, the further assumption of full employment determines the real wage which then defines the optimal labour/capital and labour/output ratios. The relevant measure of 'capacity utilisation' is then indexed by the labour/capital ratio (the intensity at or hours and shifts over which capital is worked) which, in this view, is already optimised by enterprises acting upon equilibrium market signals, in every period. As to the first (supply bottlenecks) and second (capital-labour conflict) variables noted above, both imply a state of market disequilibrium: bottlenecks will produce rents which distort measured factor shares relative to their imputed shares while conflicts signify non-technical perturbations in technology which impinge on both utilisation and factor market equilibrium. While capacity utilisation has often been used by neoclassical practitioners as a variable 'explaining' the variance in productivity growth, the underlying theoretical model is either inconsistent with a supply-side view (lacking as it does any notion of effective demand) or at least inconsistent with the equilibrium formulation within which productivity growth is measured and interpreted. If supply constraints (including those due to capital-labour conflict) are considered to have been influential, then, all productivity measures of the type considered in the present study must be viewed with suspicion if not discarded altogether.

However, there are non-neoclassical conceptions of both factor utilisation and of productivity growth proper (controlling for utilisation) that may help explain at least part of the 'residual' represented by TFPG. Consider capacity utilisation first. Factor utilisation may be influenced by the force

of effective aggregate demand under conditions of unemployment. In the Indian context, effective demand facing the industrial sector originates only partly from within that sector; an important part of demand arises from the rural economy. Hence, agricultural performance may serve as a proxy (in part) for effective demand which may then be hypothesised to affect industrial TFPG positively. It goes without saying that, in this view, a positive relationship between TFP growth and industrial output growth is also to be expected.

Consider next productivity growth proper. An important part of it may be the result not of 'technical progress' in the conventional, neoclassical sense but of a process of increasing returns to scale at the level not of an enterprise, or even of a particular industry, but of an entire sector of the economy (such as manufacturing) or even of the whole economy. Such a process has been described and analysed from Adam Smith through Allyn Young to Nicholas Kaldor. Productivity gains in such a process involve external economies, particularly those flowing from the movement of knowledgeable workers across industries and from the density of inter-industry transactions. To the extent that such increasing returns have been important, TFP growth may be again expected to be positively related to output growth.

Support for these arguments is available from international evidence recently analysed by Singh (1995). Employing data on TFP growth and GDP growth for nine regions/nations over two periods (1960-73 and 1973-87), he finds a positive and statistically significant relationship between the change in the growth rate of productivity and the change in the growth rate of output between the two periods.¹⁷ Singh concludes that the result is much more in accord with the non-neoclassical arguments of the type stated above than with the World Bank's analysis, based on the same data, which attributes the "almost universal fall in TFP growth in the recent period ... to policy mismanagement; low rates of technical progress caused by distortions, lack of competition, lack of integration with the world economy, etc" (p. 7).

Singh's theoretical framework is decidedly non-neoclassical and favors Verdoorn's Law – a positive relationship, underpinned by both effective demand and increasing returns above the enterprise or industry level, between productivity and output growth. Though Goldar (1992) presents similar regressions without providing any (supply- or demand-side) prior hypotheses or consequent interpretations of the results obtained, his results too are instructive. He regresses TFP growth for a cross-section of

major manufacturing industries against three variables: power supply to industry, imported intermediate input availability and agricultural production. Although all coefficients were positive, only the coefficient on agricultural production was statistically significant. The elasticity of TFP growth with respect to the latter was 0.40 (more than five times as large as the other two elasticities). This result lends support to the argument made above that effective demand deriving from agriculture is an important influence on industrial productivity.

Table 6 presents correlations between TFP growth and output growth (denoted QG), both as measured in this study. For the sub-sectors, TFP growth is sought to be related to both output growth in the sub-sector itself and output growth in aggregate manufacturing. Observe first that all of the correlations are positive but that, except for the public sector in Period 2, the correlations are not statistically significant for the sub-periods.¹⁴ For both of the private sectors, the coefficients fall by large margins between the two periods whereas for the public sector, they rise. Furthermore, the correlations for the small sector are substantially smaller than those for the public or pvt-lg sector, in all three periods considered.

When the correlations are considered for the entire 19-year period, the coefficients are positive and statistically significant for the public sector, the pvt-lg sector and aggregate manufacturing, i.e., for all except the small sector. The elasticity of productivity growth (obtained from the corresponding regressions) with respect to output growth in aggregate manufacturing is 5.1 for the pvt-lg sector, 5.7 for the public and 4.8 for aggregate manufacturing. The elasticities with respect to 'own' output growth are smaller – at 3.7 for the pvt-lg sector and 2.8 for the public sector – than the corresponding elasticities with respect to aggregate output growth. Three conclusions may be drawn from these relationships: (1) Verdoorn's Law holds for organised Indian manufacturing as a whole over the entire period; (2) the Verdoorn link is stronger for the public and pvt-lg sectors than for the small sector; and (3) the 'Law' apparently weakened between Period 1 and Period 2 for aggregate manufacturing and for the pvt-lg and small sectors but grew in strength for the public sector. These conclusions are at least suggestive of the positive if waning influence of effective demand¹⁵ and external economies on India's industrial performance. They also indicate the need for more detailed research addressed to the determinants of sectoral and temporal variations in industrial productivity growth sorting these out among structural factors

and those attributable to shifts in public policy.

Notes

- 1 This procedure was also followed by Balakrishnan and Pushpangadan (1994) and in our analysis of aggregate manufacturing productivity [Rao 1996].
- 2 We ignore the fact that the two-digit sub-sectors are themselves aggregates of heterogeneous industries.
- 3 Goldar's estimation allows for a 2 per cent rate of discard of the capital stock. But the constancy of the discard rate suggests that this source of difference in procedure is unlikely to be the major one behind the difference in productivity index finally obtained.
- 4 Vinod Vyasulu has pointed out to me that the 'small' sector identified in this study is more commonly referred to as the 'medium' sector by students of Indian industry.
- 5 Employment strength and capital employed are correlated but scarcely perfectly. Employment was chosen purely as a matter of convenience: to apply the capital criterion to time-series data will require adjustment of nominal cutoff criteria for the changing price level, a hazardous procedure that may generate further difficulties as the real value cutoffs do not have to coincide with the nominal cutoffs in the ASI.
- 6 Data for manufacturing net of repairs can indeed be isolated at the aggregate level, but not by size or ownership.
- 7 The construction of the data base used here, including the input price index and the capital stock series, follows Balakrishnan and Pushpangadan (1994) and Rao (1996). Disaggregated data on depreciation were unavailable for earlier years; these were estimated through extrapolation of depreciation rates, by sector, which can be computed for later years.
- 8 The product wage is obtained by deflating mean emoluments of employees by the WPI for all manufacturing. It is a sufficient statistic to capture real wage relativities across the three sectors.
- 9 Another complication that should be borne in mind is that there may be a tendency for owners' managerial earnings to be understated in the small sector the result of which would be to overstate measured profits. On the other hand, any tendency to conceal profits for tax evasion, if more pronounced in the small sector, will serve to understate profits.
- 10 This argument is developed in Rao (1994).
- 11 See Rao (1996) for an analysis of relative price trends during the study period.
- 12 Note that these markup rates, when reckoned relative to factor costs (i.e., excluding material inputs), would be three or four times as large.
- 13 Actually, Ahluwalia identifies two distinct break years: her growth accounting-based analysis suggests 1980-81 as the turning point while her econometrically estimated production function exercise points to

1982-83. In point of fact, no substantively or statistically significant difference emerges from either choice. We have retained 1980-81 as the break year not only because this alternative is highlighted by Ahluwalia herself but also because that choice gives the maximum benefit of doubt to her turnaround hypothesis.

- 14 But TFPSD grew fastest in the public sector (1.9 per cent for the whole period) and slowest in the pvt-lg sector (0.6 per cent) when the whole period is considered.
- 15 The reader should also note that our approach to disaggregation remains partial – other sources of aggregation bias such as those due to heterogeneity within the three sub-sectors identified in this study are not controlled for.
- 16 Negative productivity growth rates have been reported in several previous studies of Indian manufacturing, including Ahluwalia's.
- 17 It is noteworthy that the only country/region (out of ten) in Singh's sample which registered a rise in the rate of growth of TFP between the two periods was south Asia.
- 18 Period 1 has only 5 degrees of freedom so that the critical value of the correlation coefficient at the 5 per cent level is 0.754.
- 19 For the sceptic, it would be instructive to note that the recession induced by the SAP stabilisation shows up clearly in the steep fall in all TFP indices in the 1991-93 period. The influence of demand factors need not be ephemeral or confined to 'abnormal' years however. Factor accumulation, not just current utilisation, is influenced by the strength of effective demand. Not only does fast accumulation raise output growth but the latter, in turn, can cause productivity growth to rise via the supply-side of Verdoorn's Law.

Anandibai Joshee

Retrieving a Fragmented Feminist Image

Meera Kosambi

Anandibai Joshee was the first Maharashtrian woman to leave Indian shores in the latter half of the 19th century for higher studies abroad to become the first Indian woman to qualify as a medical doctor. The Maharashtrian psyche remains captivated by the image of Anandibai as a submissive and obedient girl-wife who fulfilled her husband's visionary ambition for her. However, the series of images sketched by Anandibai's own words produce a self-portrait in which the submissive wife coexists with an intelligent woman dispassionately perceptive of herself and her society. This essay attempts to reach the 'real' Anandibai and reclaim her fragmented feminism.

WOMEN's voices from the past, sometimes cogent and sometimes hesitant in articulating the feminine experience and the feminist protest, make it possible for us to contest the received history of the late 19th century Maharashtra. This history has consistently represented the reformist men as the sole crusaders against gender injustice in orthodox Hindu society, successful in wresting emancipatory privileges for the benefit of women, posited as passive, mute objects who participated neither in the protest nor in the struggle. The discrepancy between the available evidence and the conclusion which disregards it is a matter of the hitherto largely uncharted politics of gender reform (Kosambi 1995b). As part of the same politics, the feminist voices themselves have been effectively stilled and obscured by official history as well as mainstream society, through a variety of strategies – by simply ignoring their existence, as in the case of Tarabai Shinde's booklet on women and men,¹ and Rakhinabai's published letters on child marriage and enforced widowhood;² or by totally marginalising extraordinary women and their contribution, as in the case of Pandita Ramabai;³ or by co-opting a partial feminist into the pantheon of traditional female role models, as in the case of Anandibai Joshee. Explored here is this last case – an exemplar of the subversive process which transmuted an intelligent and independent woman and a potential threat to convention into a popular incarnation of a traditional husband-worshipping wife, shorn of her individual achievements.

Anandibai Joshee's life (1865-1887) was the stuff that legends are made of. The child of an orthodox brahmin family, she was the first – and at the age of 18, also the youngest – Maharashtrian woman to leave the Indian shores in 1883 for higher studies abroad.⁴ She was also the first Indian woman to qualify as a medical doctor, having received an American medical degree in 1886, before completing 21 years, during an era which forbade even simple vernacular literacy to women. Her choice of a medical career, though made partly with her husband's help

and support, was a personal commitment aimed at serving her fellow women, which she defended publicly and sustained through perseverance against heavy odds. Hidden by these foregrounded events was her less publicised personal life, itself a continuous struggle on many fronts, which ended abruptly a little short of her 22 birthdays.⁵

If Anandibai captured the popular imagination during her lifetime (and even a hundred years after her death), it was as a young woman at the very threshold of life, who ventured into the unknown beyond the seas at the behest of her loved and revered reformer husband; who mastered the demanding vocation of a physician in order to heal her suffering and neglected sisters; and who died prematurely in her prime, sacrificed at the altar of these reformist aspirations – thereby lending herself all too easily to the role of a tragic-romantic heroine. Thus the Maharashtrian psyche remains captivated by the image of Anandibai Joshee as a submissive and obedient girl-wife who fulfilled her husband's visionary ambition for her and who died even as she attained the glorious destiny he had outlined for her.

However, the series of images sketched by Anandibai's own words jigsaw into a self-portrait – a somewhat fragmentary, sometimes contradictory, but always a distinct, identifiable and cohesive self-portrait – in which the submissive, obedient wife coexists with an intelligent young woman who is dispassionately perceptive of herself and her society, independent in her reasoning about contemporary gender reform issues, fearless in articulating the obstacles to women's education in India, and firmly anchored to an Indian cultural and nationalistic identity. Through this fragmentary self-portrait made up of a multiplicity of images, we try to reach the 'real' Anandibai and reclaim her fragmented feminism.

This essay aims to contribute to the rewarding exercise of reconstructing women's 'doubly refracted' history,⁶ and situates Anandibai within the emergent feminism in 19th century Maharashtra.⁷ After

sketching the contours of Anandibai's life, the essay analyses the internal tensions and fragmentation in her views on a variety of gender issues, contextualises her within the contemporary feminist thought, and assesses the impact of her public stance on the women's cause in Maharashtra.⁸ It concludes by contrasting Anandibai's 'retrieved' image with her popular image, and underscores the need to free real-life women from a fictionalised portraiture, as an essential part of the feminist agenda.

I A Life-Sketch

The initially conventional parameters of the life of Anandibai Joshee, nee Yamuna Joshi, gave little indication of her future trials, tribulations and triumphs.⁹ Born on March 30, 1865 in an impoverished aristocratic Brahmin family of Kalyan near Bombay, Yamuna was one of the four children who survived out of the total of nine born to Ganpatrao Joshi and his second wife Gangabai. The proverbial unwanted daughter suffered an attack of smallpox in childhood which left faint marks on her face, doing little to improve her plain wheat-complexioned looks. However, thanks to the unusual pampering by her maternal grandmother who stayed with the family, Yamuna grew up sturdy and even earned the nickname of 'wrestler' after defeating a somewhat older male cousin in a friendly fight.

Prompted by vaguely progressive ideas which penetrated through the family's otherwise orthodox lifestyle, Ganpatrao enrolled Yamuna in the school held in a part of the family mansion, where she picked up rudimentary literacy, though preferring to play truant and spend her time in games with the neighbourhood girls. The indulgent father boasted about Yamuna's ability to read, to his much shocked visitors who shared the mainstream society's opposition to women's education.

At the same time, in a reversal of the usual parental roles, Yamuna's mother treated her

with a harshness which far exceeded the conventional maternal discipline through the accepted methods of verbal and physical chastisement. Yamuna recalled in later years:

My mother never spoke to me affectionately. When she punished me, she used not just a small rope or thong, but always stones, sticks and live charcoal. Fortunately, my body does not bear any scars, and her severe beatings did not leave me maimed, crippled or deformed. By the grace of God, my limbs survived intact! But oh! the sheer agony of those memories! I don't say this as a result of the emotional distancing which follows the passage of childhood. Truly, she never understood the duties of a mother, nor did I experience the love which a child naturally feels for its mother. This memory hurts me a great deal. A child which harbours fear for its parents cannot possibly feel affection for them, and a child which feels love for its parents does not fear them. Unfortunate indeed is the child which has missed a happy childhood. Because I understand the problem, I feel sure that I also possess the solution. If I ever have a child, I will teach people by my own example how children should be brought up [Kanitkar 1912:12-13].¹⁰

That little Yamuna looked old for her age was a source of acute anxiety to her parents who subscribed to the contemporary norm of mandatory pre-pubertal marriage for girls. The desperate Ganpatrao, additionally handicapped by his inability to afford a dowry, was greatly relieved at his family priest's discovery of Gopalrao Joshee as a potential match. Gopalrao, a 27-year old widower, was postmaster at the nearby town of Thane where he lived alone while his parental family lived at Nashik. Known to be an eccentric, with reformist ideas (which he aspired unsuccessfully to implement by marrying a widow), he finally agreed to marry Yamuna after extracting an unwilling promise that he be allowed to educate her after marriage. Hasty preparations were made for the wedding, when Gopalrao gave the Joshs their first taste of his eccentricity by not appearing for the event. Frantic negotiations were undertaken afresh, and the wedding was finally consecrated a few days later, on March 31, 1874.

The customary change of personal name turned Yamuna Ganpatrao Joshi into Anandibai Gopalrao Joshee. A couple of years later, the immediate post-pubertal consummation of marriage was performed with all ceremony demanded by orthodox custom, obviously without protest from the 'progressive' Gopalrao. Anandibai's experience of motherhood at the age of 12, rendered additionally painful by the loss of her infant son, was followed by an imperceptible but steady decline in her health and her inability to bear more children. Such long-lasting physiological damage, as a typical

result of early sexual intercourse and early pregnancy, was frequently discussed during the Age of Consent controversy of the late 1880s [Kosambi 1991], but seems not to have been identified in Anandibai's case.

Gopalrao's avowed reformist aim of educating his wife¹¹ seemed sure of fulfilment through his bright and receptive child-wife's rapid progress in Marathi, and rudimentary Sanskrit and English. He ensured freedom from her family's possible interference and quietude for studies, through a transfer to Alibag on the Konkan coast. But he alienated the conventional small town by not only educating his wife at home, thereby transgressing the rules of sex-segregation in daytime domestic activities,¹² but also taking her for evening walks – behaviour hardly tolerated even in large cities.

Tired of this social isolation and even harassment, and attracted by better educational opportunities for his wife, Gopalrao obtained further transfers, first to Bombay and then to Kolhapur. However, Anandibai's attendance at the highly regarded missionary schools at both the places remained problematic in the face of social pressure, and lack of special encouragement expected from the missionaries for this venture. Gopalrao's vicarious personal ambition, coupled with his acquaintance with American missionaries, ignited the radical plan of taking Anandibai to America for higher studies. He appealed for help to the Rev Wilder of Princeton, New Jersey, in September 1878, projecting himself as a progressive brahmin struggling against caste persecution to educate his wife, and enlightened enough to value the message of Christ. The covering letter by Goheen of the American Mission in Kolhapur sketched an enthusiastic scenario of the converted Brahmin couple as valuable propagators of Christianity. The far less sanguine Wilder merely advised Gopalrao to stay on in India and confess Christ immediately. Severely disappointed, Gopalrao sought yet another transfer, this time to Bhuj in the Gujarat region of the Bombay Presidency.

An entirely unexpected global connection developed at this juncture. In the spring of 1880, B F Carpenter of Roselle, New Jersey, came across this correspondence published earlier in the *Missionary Review* of Princeton; and, overcoming her initial hesitation, wrote to offer Anandibai her wholehearted support. The letter heralded a regular and copious correspondence leading to an unusual bonding between the 15-year old Anandibai and the American lady old enough to be her mother, whom she viewed in the light of an affectionate aunt. In a letter dated January 20, 1881, Anandibai wrote:

I already wish and feel that I should call you my aunt. There is a saying among us, "it does not matter much if a mother dies, but let not

an aunt die". This expression will show you in what respect and estimation a maternal aunt is held among us. If you allow me, I wish to look upon you as such.

Carpenter's prompt consent cemented the surrogate blood relationship.¹³

With the American avenue blocked, Gopalrao's ambitions for his wife turned towards making her the first Maharashtrian woman to take up paid government employment; and in April 1881 he obtained a transfer to the Bengal Presidency which offered women jobs in the postal department.

Life in Calcutta came as a culture shock to the Joshees. Though in the vanguard of social reform, the Bengali society was strictly sex-segregated, with "'zenana' too rigidly observed", as Anandibai commented to Carpenter in June 1881. During their evening walks, the couple were rudely stared at and laughed at by both Indians and Europeans, and even harassed by a policeman once, so unusual was the sight. As further aggravation, the climate affected the health of both, and Anandibai took to her bed for several days. The crowning misery came when Gopalrao lost an important dispatch from the Viceroy to the Governor of Bengal, for which he was arrested and even temporarily suspended from his duties.¹⁴ However, life finally resumed some normalcy, a rudimentary social network was established (to include mainly the few Maharashtrian brahmins in Calcutta), and contact was made with the Brahmo Samaj, and also the Theosophical Society of which both became members.

The socio-cultural link with Maharashtra was nurtured throughout this time and during Gopalrao's subsequent transfer to Barrackpore and then to Serampore in 1882. Marathi newspapers were read regularly, and in April 1882, the *Kesari* of Pune published Anandibai's letter and verses mourning the untimely death of the well known nationalistic but anti-reform writer Vishnushastri Chiplunkar [cited in Kanitkar 1912:326-27]. It was also during this stay at Serampore that Anandibai made an offer of hospitality to the prematurely widowed Pandita Ramabai, then living in Bengal [Dall 1888:vi-vii].

In the meanwhile, plans for Anandibai's future had crystallised: she was to enrol at an American medical college with Carpenter's help. In fact, she was to sail to America alone, with suitable female company, and Gopalrao, prevented by financial constraints from accompanying her, was to join her later. The wildfire news whipped up a storm of protest which Anandibai decided to still through a well-received and well-publicised public address at the Serampore College in February 1883, on the subject of "My future visit in America and public inquiries regarding it."

Finally, on April 7, 1883, the 18-year old Anandibai sailed from Calcutta under the nominal escort of American missionary women, and finally met her American aunt. After spending the summer with her at Roselle, Anandibai joined the Women's Medical College of Pennsylvania (currently the co-educational Medical College of Pennsylvania) at Philadelphia in October 1883. The Dean, Rachel Bodley, warmly welcomed the lonely young Indian woman both to the College and to her home for the next three years during which Anandibai completed the full course of studies. However, illness continued to dog Anandibai even here. The combined effect of the cold climate, the burning of anthracite coal in the heaters, and the rigours of the demanding medical studies took a heavy toll, and Anandibai graduated from the College already a victim of consumption. On March 11, 1886 Anandibai, now almost 21-year old, received her medical degree amidst an ovation at a splendid ceremony at which Pandita Ramabai was a guest of honour.¹⁵

Also present at the graduation ceremony was Gopalrao who had resigned his job in 1884 and travelled cheaply to the US (via Burma, Siam and China), working his way as a labourer. Immediately on arrival at San Francisco, he acquired dubious publicity through anti-American speeches which he continued to give at all the stops on his way to Roselle, while Anandibai hid her embarrassment as diplomatically as her friends – who had extended financial help to both – hid their resentment.

Compelled by failing health to abandon her initial plan of spending another year in the US to gain experience of medical practice, Anandibai accepted the fortunate offer of a newly created post for a lady doctor in the princely state of Kolhapur in the Bombay Presidency. Gopalrao reluctantly gave up his plan to travel further within the US and also to visit England, and accompanied his wife to India on October 8, 1886, reaching Bombay five weeks later.

The Joshees were warmly welcomed by the people and the press in Maharashtra – as much for Anandibai's success in education as for her conformance to conventional dress and diet, and for Gopalrao's nobility in sending his wife abroad for medical education. However, it soon became apparent that Anandibai's rapidly deteriorating health responded to the treatment of neither western doctors nor Indian Ayurvedic vaidyas consulted at Bombay and at Pune where she was shifted in December 1886.

On February 29, 1887, Anandibai breathed her last in a house of her mother's relatives – the same house where she was born less than 22 years earlier. She was cremated at Pune, but her ashes were sent to Carpenter and are buried in her family lot in the

Poughkeepsie Rural Cemetery, New York. The black stone grave marker bearing the inscription: "Dr Anandabai Joshee, MD, 1865-1887, First Brahmin Woman to Leave India to Obtain an Education"¹⁶ keeps her memory alive in an alien land which became her home for the three fateful years which changed her life as it did the subsequent social history of Maharashtra.

After Anandibai's death, Gopalrao did not remarry, and spent the rest of his life mostly at Nashik and Pune, occasionally gaining notoriety for his well-publicised activities. The first of these, with the greatest nuisance value, was the tea party he helped to organise at the Panch Houd Mission at Pune in October 1890, to which about 40 prominent citizens (including BG Tilak and MG Ranade) were invited. Although only some of the guests drank tea served by Christians, Gopalrao had the entire list published in a newspaper, with a demand that they be required to perform the requisite expiation or be excommunicated for having lost caste (*Mahratta*, July 5, 1891:4). The case dragged on for over a year and caused a great deal of harassment, without serving its ostensible purpose of exposing the reformers' hypocrisy. The second incident was a marriage of two donkeys performed in December 1890, supposedly as a comment on child marriages performed by so-called reformers. The third incident involved Gopalrao's conversion to Christianity at the end of June 1891, though he retained his sacred thread and the mark on his forehead, contending that "although he has accepted Christ as his Saviour, he does not cease to be a Hindu" (*Mahratta*, July 5, 1891:3); after about a month, he returned formally to the Hindu fold. In 1892 he made a short and unsuccessful trip to England as a trader in Indian handicrafts, and published a Marathi travel description, with a rather unbalanced commentary. In September 1912, he died at Nashik, penniless, without family or friends [Vaidya 1985]. His sporadic notoriety notwithstanding, he left no permanent mark on the social scene of Maharashtra, and remains best-known as Anandibai's husband.¹⁷

II

A Fragmented Feminism

Through wide-ranging temporal and cross-cultural shifts, three elements seem to emerge as pivotal to the myriad connotations of feminism: the belief that women qua women are subordinated to and oppressed by men, the ideal of gender equality, and action (either private or public) towards the achievement of this ideal [Kramarae and Treichler 1989:158-61]. The same themes surface in the "feminist consciousness" which is said to have evolved historically from a perception

of the distorted way of presenting women, to a questioning of the (patriarchal) tradition, to the final reaching out to other women in search of sisterhood [Lerner 1992: xxi-xxii]; and also in the "feminist perspective" which is an attempt "to describe women's oppression, to explain its causes and consequences, and to prescribe strategies for women's liberation" [Tong 1992:1].

The feminism which erupted spasmodically on the social scene of Maharashtra in the early 1880s manifested most of these crucial elements, while stopping short of the notion of forming a sisterhood or engaging in collective action (except for Pandita Ramabai's Arya Mahila Samaj set up in 1882 as a definite attempt in this direction). This was hardly surprising, given the severe constraints on women's gatherings, except for religious and family festivities. Nor did the isolated feminist voices which were raised from time to time form a discourse, in spite of personal networks and an exchange of letters among some of them.¹⁸ What is significant, however, is the fact that the women's protests were qualitatively different from the contemporary male reformist discourse (conducted within a partially liberal but firmly patriarchal framework), and questioned many aspects of the patriarchal value system and the social institutions which it undergirded.

One of the earliest challenges came from Tarabai Shinde in her militant Marathi booklet *Stree-Purusha Tulana* published in early 1882, attacking the male double standards of morality, and the male prejudices against and abuse of women. In June 1882 was published Pandita Ramabai's Marathi *Stree-Dharma Neeti* – an exhortation to women (from a male reformer's perspective) to cultivate self-reliance, and obtain education and skills in household duties and child care – whose generally anti-feminist tone was punctuated by brief but strongly worded protests against male hypocrisy and androcentric Hindu scriptures [Kosambi 1995a]. It was during her highly publicised testimony before the Hunter Commission on Education in September 1882 at Pune that Ramabai made a spirited stand for women's education, including medical education, and for the need to appoint female teachers and inspectresses for girls' schools because of the male jealousy and tendency to obstruct women's education [Kosambi 1995a]. In 1885 appeared Rakhmabai's letters to *The Times of India* under the pen-name of 'A Hindu Lady', in which she attacked the custom of child marriage for exposing the girl-bride to emotional harassment and physical violence, while simultaneously depriving her of education and the chance of personality development; and also detailed the variety of oppression experienced by widows in different age-groups; ending with

reformist recommendations [cited in Varde 1991:190-208]

The extent of Anandibai's familiarity with any of these writings remains unknown. Although away in Bengal and later in America throughout these years, she did keep in touch with the socio-cultural developments in Maharashtra through Indian newspapers which reported and commented on many of these events and related debates. It must be remembered, however, that Pandita Ramabai's *The High-Caste Hindu Woman*, almost an Indian feminist manifesto, published in the US in 1887, post-dated Anandibai's death by a few months.

This chronology assumes significance here because many of Anandibai's comments cited below date from 1880-81 when she was 15-16 years old – younger than Rakhmabai who was 19 at the time of writing her 'Hindu Lady' letters, and then Pandita Ramabai who was 24 when she made her meteoric appearance in Maharashtra in 1882. That Anandibai was at all able to arrive independently at her views on what would now be called feminist issues, at that relatively young age and in the absence of an ongoing feminist discourse, is remarkable. Her young age could be considered a significant factor in explaining the occasional hesitation apparent in her views, although she lived in an era when emotional maturity came early, as did family responsibilities, and when a 15-year old girl was regarded as a grown woman, often a mother (as Anandibai herself would have been). Further, there is no indication of a noticeable change in her views as she grew older and was exposed to a substantially different culture.

The problems of presenting a fair and just interpretation of Anandibai's positions are obvious: the paucity of material and the resultant danger of reading too much into a chance remark; the inevitably heavy reliance on private correspondence not intended for the public gaze¹⁹ – not even for the biographer's unwillingly inquisitive gaze – and therefore not formulated as well-reasoned statements, although she obviously put a lot of thought into her various discussions with Carpenter; and the long interval between successive segments of a discussion (as a letter took about five weeks to reach, even an immediate reply involved a delay of ten weeks). Equally importantly, Anandibai was struggling to express complex ideas in a foreign language which she was still in the process of mastering, and doing so in a way which would give a stranger a fair picture of unfamiliar and much criticised Indian customs.

The broad gender-related foci of Anandibai's privately expressed views and public statements were: women's subordinate position in marriage, family, and society; the custom of child marriage; the neglect of

women's health; the need for training women doctors to treat women patients; and the obstacles to women's general education as well as professional medical education. These views are conspicuously moulded by her strong nationalism and loyalty to the Hindu culture.

Her universalised personal experience of asymmetrical gender relations within the typical Hindu marriage were unequivocally expressed in the 37-year old Anandibai's letter (dated about 1884) from America to her 37-year old husband:

It is not at all my intention to distress your dear heart or to cause a rift in our love by raking up old memories. It is very difficult to decide whether your treatment of me was good or bad. If you ask me, I would answer that it was both. It seems to have been right in view of its ultimate goal; but, in all fairness, one is compelled to admit that it was wrong, considering its possible effects on a child's mind. Hitting me with broken pieces of wood at the tender age of ten, flinging chairs and books at me and threatening to leave me when I was 12, and inflicting other strange punishments on me when I was 14 – all these were too severe for the age, body, and mind at each respective stage. In childhood the mind is immature and the body undeveloped. And you know how I acted on these occasions. If I had left you at that immature age, as you kept on suggesting, what would have happened? I would have been lost. (And any number of girls have left their homes because of harassment from mothers-in-law and husbands.) I did not do so because I was afraid that my ill-considered behaviour would tarnish my father's honour. And I requested you not to spare me, but to kill me. In our society, for centuries there has been no legal restraint between husbands and wives; and if it exists, it works against women! Such being the case, I had no recourse but to allow you to hit me with chairs and beat it with equanimity. A Hindu woman has no right to utter a word or to advise her husband. On the contrary, she has a right to allow her husband to do what he wishes and to keep quiet. Every Hindu husband can, with advantage, learn patience from his wife. (I do understand that without you I would never have become what I am now, and I am eternally grateful to you; but you cannot deny that I was always calm.) I was born to endure all that. But I am quite content now [Karnikar 1912:188-89*].

This clear indictment of Gopalrao's verbal and physical (and perhaps also sexual) violence and autocratic behaviour as well as her admission of her own helplessness as a Hindu wife, are framed within the socio-legal norms which sanctioned both. Here the paradox surfaces again. The extract also underscores the fact that Gopalrao's one mitigating 'virtue', that of providing his

wife with basic education and with the opportunity to go abroad for higher studies, was so rare at the time as to compensate for everything else. As Anandibai wrote to Carpenter from Bhuj on November 15, 1880:

I do not expect much encouragement from the other members of my family. They are, properly speaking, orthodox to the letter, and cannot be expected to sympathise with me. But as my husband is so much in favour of ... [giving women] emancipation, no one dares turn his face against me

Anandibai's views on gender relations and her own awareness of their complexity (and possible contradictions) become clearer in another letter to Carpenter [Bhuj, December 15, 1880]:

[W]hen I ponder over the subject of the connection between man and woman, I generally side with the so-called orthodox ideas. *So long as woman is not on equal terms with man*, it is better for her to be under certain social restrictions, such as "not to marry again", "To be subservient to man", "To look upon her husband as God". These are the enjoinders of our Shastras. On the other hand, when I think over the sufferings to which woman is subjected in all ages and at all times, I grow impatient to see the western light dawn upon us as the harbinger of emancipation and future good. Here I feel my inability to express myself as fully as I think. I am led to believe that man and woman should be self-protecting and that one should not depend upon the other for maintenance and other necessities of life. Then and only then, all family discords and social humiliation will cease. I am very sorry to see that there are many ladies among Europeans in India who are educated and accomplished for the purpose of marriage. Alas! how mischievous it is for a lady to adorn and change dress every hour in order to allure bachelors (emphasis added).

The line of argument here develops from a pragmatism (which appears like anti-feminism), to a belief in ultimate gender equality through western influence and individual self-reliance, and further to a nationalistic expose of the obverse side of European society. To begin with, the woman's subservient role as a husband-worshipping wife, being an imperative of the firmly entrenched patriarchy in Hindu society, is best observed through customs which reduce or eliminate her psychological tensions and conflicts. In short, women, handicapped with a lack of options, should consent to their own subordination. However, as these customs did entail a heavy cost to women, it was hoped that patriarchy itself would be challenged by the spread of western civilisation, with its liberal value system and institutions, thus emancipating women and relieving their suffering. Ultimately, the relationship of dependence and dominance

should be done away with altogether; in fact, gender equality would become a distinct possibility if its precondition, self-reliance, was realised. In the meanwhile, it was unfortunate that while Indian women were hankering after the potentially emancipatory gift of western education, European women were frittering it away by short-sightedly preferring to remain within the bondage of marriage. By implication, European society was not as advanced or as superior to Indian society as was claimed.

In her above-cited letter of November 15, 1880, Anandibai also makes a somewhat oblique and sarcastic reference to the universal son preference in Indian families:

We have no polygamy to speak of. Our people, if they at all take more than one wife, marry for the sake of sons if they do not have any by first or second wife. So you see how fond we are of sons socially and religiously. The Heavens are open to the man who has a son, but not otherwise.

Women's social inferiority translated into the general neglect of their needs, regarding which Anandibai says, in one of her earliest letters to Carpenter [Bhuj, July 19, 1880]:

We have the same dress for all the seasons. We never put on warm clothes as it is considered indecent, nor do we wear shoes or boots as we seldom go outdoors. In short, all these luxuries are for men, who feel cold, warm and autumn [weather] and not for women who are supposed to be impervious to all these changes of climate. Should we not envy you then?

The custom of child marriage, increasingly challenged in India and already under attack in the west, drew a somewhat vacillatory response from Anandibai. Basically, it seemed to be a dilemma of societal wisdom which sanctioned the practice, as against lived experience which protested against it – a dilemma further complicated by her unwillingness to condemn an Indian custom to a westerner. In her letter to Carpenter [Bhuj, August 23, 1880], she resolved the dilemma by insisting, first, that all marriage systems – Indian and western – were faulty, and secondly that their alleged role in causing women's health problems was doubtful as even unmarried women had poor health:

I, of late, have been ill with something or the other. In higher classes women generally are very weak in India. I ascribe the cause to the custom of early marriage prevailing in all India but as you complain of the same I think there is some wrong in the marriage system.

The discussion on the effects of child marriage was long drawn out, and Anandibai was almost aggressive in her insistence that women's health problems arose not from child marriage alone, but from the institution of marriage itself, or from independent

causes which affected even unmarried women. Almost a year later she wrote [Kalyan, March 1881]:

Early marriage is no doubt a bane. When we deviate from the laws of nature, we must suffer the consequences. The practice of early marriage is not prevalent in many countries and yet the women there often are weak and ill-constituted as we are. I know of one lady (who was a spinster) who was always complaining of some thing or the other and never appeared in good health. So there are many European ladies in India, old and young, whose faces are pale and gloomy. There is no bloom on their countenances. I do not know the cause. If it is early marriage, as many of us suppose, I shall feel obliged if you will kindly account for the same condition perceptible in all civilised countries²⁰ in which there is no such thing as early marriage. Early marriage will no doubt be one of the causes which lead to this havoc, and destruction of life. I admit that the condition of Indian women is miserable and deplorable... [But it would be undesirable] if we try to destroy all the old institutions as pernicious without having some thing better to substitute for them. The European mode of life and delicacy of manners and customs are not... [worthy of appreciation] as they appear on the very face, are expensive and not within the reach of the masses. Anything that cannot be enjoyed by the masses must be bad. I however hope that you will kindly enlighten me on the subject I have so rudely and without regard to logic or reasoning handled above. My defence of our present customs and manners will at least show you how ignorant we are and how prejudiced are our opinions against anything that is now prevalent. You say that Nature has designed us to mate at an early age and therefore infer that we must be earlier married but not before puberty... [But it is neither Nature nor religion to blame for introducing early marriage. There must be something else which I leave it to you to solve.

Surprisingly, Carpenter seems to have supported early though not pre-pubertal marriage, and possibly imagined that Hindu child marriages were consummated before puberty.

Somewhat abruptly, Anandibai's vacillation ended in her very next letter (Calcutta, April 1881) which made an explicit and radical statement endorsing British legislation for introducing social reform:

We have many societies for the prevention of early marriages, but they cannot exercise a powerful influence over the irresistible tendencies of the generality of people. Almost all the rich and influential people are orthodox to the letter, and cannot be prevailed upon to put a stop to heinous customs and manners unless the strong ruling force interferes. The custom of 'suttee' has been forcibly abolished and the early marriage requires

a similarly deadly blow before it can give way.

It is only against this background that one can appreciate the nationalistic compulsions in Anandibai's public defence of the custom of child marriage at a meeting of American missionary women in the spring of 1884. Her American friends, unaware of her private misgivings, saw this as an inevitable result of her social conditioning: Dean Bodley, for example, sought to dispel "the feelings of disappointment and regret engendered that April afternoon" by stressing "how absolutely impossible it was for a High-caste Hindu wife to speak otherwise" [Bodley 1981:ii-iii].

A deep concern for women's health and an urgently felt need for women doctors underpinned Anandibai's career decision, as she eloquently conveyed to Carpenter (Bhuj, November 1, 1880):

I am late this time by 15 days to mail this letter. It is on account of my serious illness, which confined me to bed for nearly 3 weeks. This sickness confirms me in my desire to study medicine. Though my sickness was not of a serious nature, yet I was at one time so much affected that I had passed some days and nights without the least relief until we had recourse to professional medical advice and treatment. As a rule we Indian women suffer from innumerable trifling diseases, unnoticed till they grow serious. The internal diseases to which women are naturally liable are never known to anybody except the sufferers. It is thought indecent to let them go to the knowledge of the other sex, much more [so to be] examined by male doctors. You may therefore imagine the mortality among Indian women. If I make no exaggeration, fifty percent die in the prime of their youth of diseases arising partly through ignorance and loathsomeness to communicate of the parties concerned, and partly through carelessness on the part of their guardians or husbands. It is not a calamity if a father loses a daughter or two as he is thereby spared much trouble and embarrassment to which he is exposed by *abominable customs and manners* (emphasis added).

In articulating this particular universalised personal experience of the gynaecological and other health problems of women, Anandibai made no distinction between private and public expression, as seen from her public address at Serampore:

I go to America because I wish to study medicine. I now address the ladies present here, who will be the better judges of the importance of medical assistance in India. I never consider this subject without being surprised that none of those societies so laudably established in India for the promotion of sciences and female education have ever thought of sending one of their female members into the most civilised parts

of the world to procure thorough medical knowledge in order to open here a college for the instruction of women in medicine. There is probably no country so barbarous as India that would not disclose all her wants and try to stand on her own feet. The want of female physicians in India is keenly felt in every quarter. Ladies both European and Native are naturally averse to expose themselves in cases of emergency to treatment by doctors of the other sex. There are some female doctors in India from Europe and America, who being foreigners and different in manners, customs and language, have not been of such use to our women as they might. As it is very natural that Hindu ladies who love their own country and people should not feel at home with the natives of other countries, we Indian women absolutely derive no benefit from these foreign ladies. They indeed have the appearance of supplying our need, but the appearance is delusive. In my humble opinion there is a growing need for Hindu lady doctors in India, and I volunteer to qualify myself for one [cited in Dall 1888:83-84].

In the early 1880s, before the introduction of the Dufferin scheme,²¹ medical education was practically impossible for women to obtain in India; where the opportunity existed in theory, it was effectively negated in practice by the male jealousy and hostility towards women's professional education. Even ordinary education was fraught with difficulties because of the vocal social opposition to Hindu women's school attendance, as Anandibai described vividly to her audience at Serampore:

I do not mean that there are no means [for a woman to study in India], but the difficulties are many and great. There is one college at Madras, and midwifery classes are opened in all the presidencies; but the education imparted is defective and not sufficient, as the instructors who teach the classes are conservative, and to some extent jealous.²² I do not find fault with them. That is the characteristic of the male sex. We must put up with this inconvenience until we have a class of educated ladies to relieve these men.

I am neither a Christian nor a Brahmo. To continue to live as a Hindu and go to school in any part of India is very difficult. A convert who wears an English dress is not so much stared at. Native Christian ladies are free from the opposition or public scandal which Hindu ladies like myself have to meet within and without the zenana. If I go alone by train or in the street some people come near to stare and ask impertinent questions to annoy me. Example is better than precept. Some few years ago, when I was in Bombay, I used to go to school. When people saw me going with books in my hands, they had the goodness to put their heads out of the window just to have a look at me. Some stopped their carriages for the purpose. Others walking in the streets stood laughing,

and crying out [derisive remarks] so that I could hear [them]...

Passers-by, whenever they saw me going, gathered round me. Some of them made fun and were convulsed with laughter. Others, sitting respectfully in their verandahs, made ridiculous remarks and did not feel ashamed to throw pebbles at me. The shopkeepers and vendors spat at the sight of me, and made gestures too indecent to describe. I leave it to you to imagine what was my condition at such a time, and how I could gladly have burst through the crowd to make my home nearer! [cited in Dall 1888:84-86].

This social resistance was aimed not only at the fact of a woman encroaching upon the field of education long treated as a male preserve, but also at her attempting to cross the domestic threshold to enter the public sphere, as Anandibai was quick to point out:

Yet the boldness of my Bengali brethren cannot be exceeded, and is still more serious to contemplate than the instances I have given from Bombay. Surely it deserves pity! If I go to take a walk on the strand, Englishmen are not so bold as to look at me. Even the soldiers are never troublesome, but the Babus lay bare their levity by making fun of everything. "Who are you?" "What caste do you belong to?" "Whence do you come?" "Where do you go?" are, in my opinion, questions that should not be asked by strangers. There are some educated native Christians here in Serampore who are suspicious; they are still wondering whether I am married or a widow, a woman of bad character or excommunicated! Dear audience, does it become my native and Christian brethren to be so uncharitable? Certainly not! I place these unpleasant things before you, that those who have never thought of the difficulties may see that I am not going to America through any whim or caprice [cited in Dall 1888:86-87].

The society which denied women the opportunity to study and practise western medicine presumably excluded them also from the traditional Ayurvedic medicine monopolised by conservative Brahmin men. However, Anandibai's staunch nationalism prompted her to retrieve ancient Hindu knowledge, as she declared to Carpenter (November 15, 1880):

The Europeans are under the impression that there is nothing worth knowing in Hindu scriptures and I have therefore taken up Sanscrit to show them how sublime, useful and instructive are the precepts in Hindu Shastras.

More specifically, this preoccupation was reflected in Anandibai's medical dissertation submitted for her MD, on 'Obstetrics among the Aryan Hindoos' [Joshee 1886] – a topic which she justified in these words:

As the importance of obstetrics can be measured only by the value of life and health,

and both being of paramount consequence, it is deserving of most careful study. When we realise how difficult and vast the subject is, it is not surprising to find so many great minds thoroughly absorbed in its magnitude, from the time immemorial. Since our study naturally embraces, the cause and effect, race habits, climatic influences and means of assisting Nature in her operations, we must not entirely overlook the history of past ages and consider the superior minds, which laboured, with marked success in the same field of investigation, under the promptings of the same motives, as far back as 15 Century B.C. They may enable us to the better appreciation of the science and pay due respect to the discoveries, theories and mode of application of remedies of minds of different nations at different times. I therefore need not apologise for choosing this subject.

The dissertation outlined in detail the "good rules laid down by Manu the great aryan legislator, Susruta, and other physiologists", regarding the hygiene of pregnancy, causes of abortion, preparation for lying in, accidents of labour, and, briefly, the diseases of infancy and was concluded with these lines:

I have not mentioned those principles, theories and treatment in this paper which are entirely out of practice in India, though there are many valuable things with perhaps as many ridiculous ones in our ancient medical and surgical literature (concerning obstetrics) that are not in practice. I have said too little to do justice to what is taught and practised among the brahmins but on account of the rarity of valuable time and space I am obliged to say no more.

That Anandibai's interest in ayurvedic medicine transcended mere nationalistic pride into genuine belief in its efficacy is indicated by the fact that she was under ayurvedic and not western medical treatment during her last days (provided the choice was hers and not her husband's).²³ Had she lived longer, she might even have been able to forge a gradual entry into this orthodox male-dominated science.

III Articulations, Actions and Social Repercussions

If Anandibai's conformist image overshadowed everything non-conformist about her, it was for rather complex reasons. Tensions were inherent within the totality of her partially feminist private beliefs, and between these and her largely conventional actions. If she made a progressive feminist statement through her medical studies in America to help ailing women back in India, she also made an emphatically conventional and anti-feminist statement by conforming to the orthodox image of the ideal Hindu wife – which probably originated partly in

genuine belief, partly in the need to keep her reservations to herself in a society which allowed no space for woman's protest against the patriarchal family institution, and partly in the nationalistic spirit which would not allow her to criticise Indian society to non-Indians. However, given the wide spectrum of her contemporary feminist expression (with various permutations and combinations), these tensions may not necessarily have resulted in a "cognitive dissonance". The fragmentation obvious to us from our very different vantage point may not have been experienced as problematic by her or her contemporaries.

In her private letters Anandibai acknowledged the general subordination of Indian women, their oppression within marriage and family, and implicitly also their sexual oppression, as well as the religious and socio-legal endorsement of these. In public, however, she never touched upon these issues and even defended the custom of child marriage. Incidentally, Gopalrao himself, for all his reformist image, was a staunch supporter of child marriages which, for him, was a matter of national pride. In a letter to the editor of *The Index of Boston* (April 1, 1886), he defended child marriages as "simple and innocent", born out of the Indian "abhorrence of lottery in love", because "late or choice marriages... are made and unmade according to the demands of lust". He insisted that Indians did not want to adopt "this substitute for early and permanent marriage" which was a "cheap commodity from Europe", adding: "Let England and America preserve it as an emblem of independence and liberty". Gopalrao's clinching arguments were that: "Wherever the child marriage does not prevail, there prostitution is carried on on an extensive scale" and that "We have no such divorce system as you have in the United States". Whether Anandibai used any of these arguments during her talk on child marriage remains unknown.

It was only on one part of women's subordination, namely the denial of education and health care, that Anandibai's private and public views coincided. At the same time, her very visible deference and obedience to her husband's wishes served to negate her feminist stand, reinforce the conventional ideal of womanhood, and resist all social institutional change. Her respect for convention, especially her insistence on retaining a Maharashtrian brahmanic diet and dress (with the only change that the nine-yard sari was worn in the Gujarati style, as more suitable to the cold climate) underscored the traditional role of women as the chief repositories of culture, and received disproportionate attention. It is possible that her behaviour stemmed more from a mooring to her cultural anchorage

than any intended anti-feminism, but to the contemporary Maharashtrian mind, this achievement seemed as great as her medical degree. *The Mahratta* welcomed the Joshees to India by emphasising that "the difficulties of Mrs Anandibai were such as no man or woman of ordinary moral and physical strength could have overcome", but that happily she and Gopalrao overcame them all and returned to India "with western culture but without a taint of western vice. Mrs Joshee has preserved her Hindu habits and customs and that too at no small personal inconvenience"; and invited "the orthodox people as well as reformers" to "duly appreciate the worth of Anandibai's heroic act" (November 21, 1886:4).

Anandibai's public vow to "go to America as a Hindu and return as a Hindu", which she fulfilled in letter and spirit, was cause for great relief and reassurance to a society which had just 'lost' Pandita Ramabai to Christianity in 1883 during her much-opposed visit to England. Predictably this aspect of Anandibai's life received exaggerated publicity, favourably contrasted with Pandita Ramabai. Given the fact that other educated women like Ramabai and Rakhmabai had attacked Hindu social customs and even religion, it was natural for conventional society to seize the opportunity to claim Anandibai as its own, more in spite of than because of her medical degree. After all, presenting Anandibai as a role model had the advantage of pressing home the ideal of the devoted wife without the fear that any other woman would be inspired to emulate her educational achievement - simply because none would be allowed to, either by her husband or her marital family. It is significant that the next woman to become a medical doctor was Rakhmabai who left for England in 1889, a year after she was formally released by her husband from the marriage which she had repudiated, and with full support from her parental family [Kosambi 1995c]. Obviously, not many other women of the educated class would have such freedom.

Thus the social repercussions of Anandibai's fragmented feminism were predictably complex and contradictory. Even while her 'submissive wife' image valorised the patriarchal ideal and indicated the limits to women's achievements, this very conformity to convention enabled her to carve out a new emancipatory space for women within this constricting social structure [Kosambi 1994:19].

IV

Popular Image and Retrieved Image

It is ironical, though perhaps not surprising, that Anandibai's original image as an achiever, projected by her feminist biographers Kashibai Kanitkar and Carolyn

Dall, came to be effectively subverted by her popular image created by a male novelist, S J Joshi (1970).

Kashibai Kanitkar's biography of Anandibai is unique as the very first biography of a Maharashtrian woman written by a contemporary, herself a woman, and, moreover, in Marathi. In her Preface, Kashibai records her feminist idealistic determination that the biography of such a great woman should be written by a woman, and not by one of the many willing men - a determination which ultimately compelled her to undertake the task herself, with an aim spelt out in these words:

If this book ignites, in the mind of even a single one of my sisters, a spark of the patriotic fire which forever burnt in Anandibai's great heart, I shall consider myself blessed and the happiest person in the universe [Kanitkar 1912, Preface:4*].

In elucidating Anandibai's greatness, Kashibai identifies the obstacles confronting her and the resultant tensions:

Aiming at the general progress of her sisters, Anandibai was able to display several achievements, such as constantly battling with obstacles in her path; working out a compromise between the old and new viewpoints with wisdom, far-sightedness and maturity; pleasing the modern impatient reformers without hurting the old-fashioned people; not adopting a foreign religion even after spending three years in a totally Christian country; cherishing her own cultural practices without offending the foreigners - achievements which no man has so far been capable of! What does our country need? The answer is - determined and courageous individuals like Dr Mrs Anandibai [Kanitkar 1912, Preface:8*].

Kashibai's biography, intended to serve the dual purpose of inspiring women to great achievements, and inducing men to support them, is consciously used as a platform for making public statements on the problems of women, invariably accompanied by suggested liberal reformist solutions. Her perception of Anandibai as a role model forms the very basis of the biography, written as a 'modest commemoration' of her extraordinary efforts for national welfare [Kanitkar 1912:322].

This reformist stance stemmed from Kashibai's unstated but obvious empathetic understanding of women's problems, within a shared socio-cultural context. At the same time, being situated in a society in transition also created inner tensions and contradictions in Kashibai's ideological position. Her conscious tussle with the power of patriarchy and her occasional submission to it are reflected in an ambivalence (also shared by Anandibai) which result in her projection of Anandibai,

alternately as an independent agent and a creation of her husband to whom she owed a heavy debt of gratitude

Predictably, only one part of Anandibai's image, that of a devoted wife who followed her reformer husband's dictates and was propelled into fame as his creation, gained ground during her own lifetime when Gopalrao Joshee was much lionised as a reformer who outpaced others to make his wife into a role model for Indian womanhood. Endorsed by an ambivalent Kashibai Kanitkar herself, this image assumed a life of its own as the real Anandibai Joshee half a century later in S J Joshi's gripping Marathi novel *Anand Gopal* (1968, 1970). The novel weaves an imaginary world around an authentic and very selective biographical core taken from Kashibai (creating a misleading impression of it being genuinely historical source material), and has enjoyed immense popularity, together with its stage adaptation. But, for all its appeal and occasional insights into a bygone age, it remains a work of fiction – which becomes problematic mainly for its subversive androcentric projection of a passive non-feminist image of Anandibai. The same holds true of its abridged English translation *Anand Gopal* (1992).

Ironically, S J Joshi also claims empathy with the Joshees, born out of a shared middle class Brahmin culture and life-style of pre-World War II Pune, which according to him had remained unchanged for a hundred years [Joshi 1970: Preface]. Joshi imposes this cultural ethos, built around the mainstream Brahmin society's strongly patriarchal values, preferences and frustrations, on the narrative of the Joshees' lives, but is unable to grasp the socio-political transitions of the late 19th century, or the distance travelled by the Joshees (especially Anandibai) from the shared brahmanical culture. In fact, the novel's protagonist is not really Anandibai who is portrayed as a tragic and almost defeated figure rather than a courageous one facing life's challenges, but Gopalrao who is portrayed as a frustrated visionary whose mischievous eccentricities (some of which the author has located before Anandibai's death as a matter of artistic licence) are presented as justifiable or even heroic. In fact, the novel reaches its climax with Anandibai's realisation and admission, on her death-bed, that Gopalrao is far ahead of their society which is incapable of understanding his true worth. Thus an 'empathetic' subjective interpretation, unfounded on facts, distorts an intelligent, self-sufficient, independent, young Anandibai – outspoken about the need for women's education and health care, staunchly nationalistic but open-minded about matters of religion, and possessing a quiet sense of humour – into a pathetic

puppet living in constant dread of her husband's fiery temper and venomous tongue.

As one perceptive critic of the novel has pointed out, Gopalrao's undoubted courage in sending Anandibai alone to America need not be accorded inflated importance, nor is there any justification for his blatantly publicity-hungry behaviour or his jealousy of his wife's achievements which made him constantly upstage and humiliate her through verbal attacks on her and everything associated with her success – the American society, women's education, and finally even western medicine [Dhond 1994]. In misrepresenting Gopalrao, S J Joshi has also misrepresented Anandibai whose sadly short but eventful life has been reduced to a melodrama, whose agency has been buried under her alleged submissiveness, and whose innovative coping mechanisms [Kosambi 1992] have been completely obscured.

Unfortunately it is this image which has captured the Maharashtrian psyche. Arguably then, Anandibai's real tragedy is to live on through a false popular image as an intelligent but dependent and obedient wife of an allegedly visionary husband rather than as an independent agent with a will of her own – a popular image which has successfully eclipsed her emergent feminism, however fragmented and contradictory.

Notes

[This article is based on the material collected during the last few years towards a forthcoming book on Anandibai Joshee.

I would like to acknowledge my gratitude to the following individuals. William Cobb of Ridgewood, New Jersey, US, the great-grandson of B F Carpenter, for giving me a copy of a near-complete set of Anandibai's letters from India to Carpenter in the US; Arvind Tikekar, former librarian of the Jawaharlal Nehru Library of Bombay University, for making available a copy of Anandibai Joshee's medical dissertation, and Aron Tikekar, editor of the *Loksatta*, for sharing a copy of Dall (1888) before I had access to it in the New York Public Library.

It should be clarified that the wide variation seen in Anandibai's style of writing has arisen because some of her letters are available in the original, some (along with the manuscript of her speech) are available in Dall's edited version, and some have been translated by me from the Marathi originals (or translations) in Kanitkar (1912).]

1 Tarabai Shinde's booklet *Stree-Purusha Tulana* (1882) was resurrected by GS Malshe in 1975.

2 Rakhmabai's court case was first discussed by Y D Phadke in an article in 1977, and further details together with her letters

(published under the pseudonym 'A Hindu Lady' in *The Times of India* in 1884) were publicised in Mohini's Varde's biography of her (1982). For a further discussion of Rakhmabai's court case and the controversy surrounding it, see Kosambi (1995c).

3 The only writings of Pandita Ramabai currently available are *The High-Caste Hindu Woman* (1887) reprinted in 1981 by the government of Maharashtra, and *A Testimony* periodically reprinted by the Ramabai Mukti Mission at Kedgaon (10th ed. 1977). For a discussion of Ramabai's contribution and marginalisation, see Kosambi (1988, 1992, 1995a).

4 Anandibai sailed on April 7, 1883 from Calcutta for New York via London, under the nominal escort of European missionary ladies, but alone for all practical purposes. A few days later, on April 20, 1883, Pandita Ramabai sailed for London from Bombay with her baby daughter and a woman companion.

5 Short lives are often seen as a biographical handicap. "It may be romantic to die young, but poets aside, it's not much of a biographical proposition" [Roe 1992: 5]. Anandibai's short life had complex effects while the biographical material is rich enough to overcome the handicap, her early death (with the obvious and oft-drawn comparison with Keats) served to romanticise and popularise her, for better and for worse.

6 Gerda Lerner (1992: xix) discusses the existing documentation of women's history as "refracted doubly – through the lens of men's records and observations, through the application to it of male values".

7 This has been partly done in Kosambi (1995a), while discussing Pandita Ramabai's evolution towards feminism.

8 Anandibai's views and their effect on Maharashtra have been partly examined in Kosambi (1994), in comparison with those of Rakhmabai and Pandita Ramabai. However, new material has since come to light, in the form of Anandibai's letters mentioned above.

9 These biographical details have been collected largely from Kanitkar (1912) and supplemented with Dall (1888).

Anandibai's parental family spelt the surname as 'Joshi' and her husband as 'Joshee', the same spellings are retained here. Maharashtrian names are written starting with the personal name, followed by the father's or husband's name, and lastly by the surname.

10 All quotations marked with an asterisk (*) are my own translations from the Marathi.

11 The few young women who managed to get an education did so at home from their reformer husbands; it was not considered 'proper' to send girls to school; in any case, girls' schools existed only in large towns and cities.

12 The tutoring of wives was done at night, when the couple could legitimately spend time together. A case in point is Ramabai Ranade's experience of her lessons done in the early hours of the morning, and her

- harassment by the older women in the family for even agreeing to be educated [Ranade 1910]. An excellent and representative statement of the daytime sex-segregation within the house is the remark by Anandibai's contemporary, Yashodabai Joshi: "During the whole day, the menfolk and the womenfolk in our house did not even see each other except at mealtime; then what possibility was there of talking to each other or spending time together?" [Y Joshi 1985:17*].
- 13 The urge to convert a close friendship into a surrogate blood relationship was conspicuous in other contemporary cases as well. Pandita Ramabai, for example, called her elderly spiritual preceptress Sister Geraldine 'Ajeebai' (grandmother) [Pandita Ramabai 1977].
 - 14 This particular experience of the British official attitude to Indians seems to have considerably reinforced Anandibai's anti-social stance which surfaces in some of her letters -- a stance which contrasts with an affinity to Americans who were perceived to be free from colonial biases (though not from the bias of racial/cultural superiority to which Anandibai did react sharply in her private letters to India). The same triangular Indo-British-American relationship also played an important role in Pandita Ramabai's life and career.
 - 15 Bodley had written a special letter of invitation to Pandita Ramabai (then in England) for this occasion, acknowledging that it would greatly benefit Anandibai if Ramabai "gave your sanction to her act and enfolded her and her work in your own future leadership" [Pandita Ramabai 1977:165].
 - 16 Anandibai's name was sometimes spelt 'Anandahai' by her American friends, including her biographer Dall, though not by the Carpenters, which makes the discrepancy noticeable in this case. The grave marker features as a landmark on the 'walking tour' offered by the Poughkeepsie Rural Cemetery. My first sight of it on a cold and snowy day in December 1995 was almost overwhelming in its symbolism.
 - 17 Gopalrao's only other lasting contribution was the education of his late brother's only child, a daughter named Sai, later married to Wrangler R P Paranjape of Pune. Saihai was the mother of Shakuntalabai Paranjape, famous for her writings and pioneering work in family planning (as an associate of R D Karve, son of D K Karve), and the grandmother of Sai Paranjape, the well-known playwright and film-maker. This is another link across time which brings Anandibai and Gopalrao closer to us.
 - 18 In the early and mid-1880s, Pandita Ramabai corresponded with both Anandibai Joshee and Rakhmabai (who had been the secretary of the Bombay branch of the Arya Mahila Samaj [Varde 1991:132], and possibly also Ramabai Ranade (who, however, was hardly a feminist) and Kashibai Kanitkar with both of whom she was well acquainted. Anandibai Joshee corresponded also with Ramabai Ranade and possibly Kashibai Kanitkar.
 - 19 Anandibai registered her strong displeasure in a letter to Gopalrao from America (January 9, 1884) about his habit of sharing her letters with acquaintances, and explicitly requested him not to give them for publication as he was planning to do (Kanitkar 1912:224-29). At that time he had already had extracts from her letters published in newspapers (e.g. *The Theosophist*, August 1883, October 1883; *Kesari*, November 6, 1883).
 - 20 Anandibai's frequent usage of terms such as 'civilised countries' for Western countries and 'Natives' for Indians was in conformity with contemporary practice.
 - 21 A landmark in this field, the Dufferin scheme (more accurately 'The National Association for Supplying Female Medical Aid to the Women of India', popularly known after its president, the Countess of Dufferin) was launched in 1885 with the objective of bringing "skilled medical women from Europe and America" to provide medical relief to Indian women; training Indian women as doctors, nurses and midwives; and opening women's hospitals and "female wards". The first Indian beneficiary of this scheme was Anandibai, and the second, Dr Rakhmabai. Before the introduction of this scheme, English girls in India surmounted the difficulty by returning to Europe or going to the US to study medicine. It is interesting to note that among the women who graduated with Anandibai in March 1886 was one Jessica R Carleton from India (*The Philadelphia Evening Bulletin*, March 11, 1886:6).
 - 22 The clearly feminist reference to the male jealousy of female achievement as a major obstacle for women also occurs in Pandita Ramabai's testimony before the Hunter Commission on Education in 1882.
 - 23 Kashibai Kanitkar claims that Anandibai herself had insisted on Ayurvedic treatment. However, she admits to having generally relied on Gopalrao's testimony even while questioning its veracity. This inconsistency remains a weakness in her otherwise excellent account of Anandibai's life and letters.

1985 Textile Policy and Handloom Industry

Policy, Promises and Performance

K Srinivasulu

It is a decade since the New Textile Policy was adopted by the then Rajiv Gandhi government. It is time for a critical appraisal of the policy. This paper attempts to assess the impact of the policy on the handloom sector.

I The Context

RAJIV GANDHI's regime marked the beginning of the early phase of liberalisation. A series of new policy initiatives undertaken during this period, unrestrained by the ideological inhibitions of the earlier regimes, points to the shift. The new found confidence, emanating from a massive popular mandate unprecedented in the electoral history of the Congress and an overwhelming three-fourths majority in the eighth Lok Sabha in the 1984 general elections, was evident not only in these policies but more so in the way they were launched.

The hallmark of the early phase of Rajiv Gandhi's tenure was a decisive attempt at a shift from the framework of state-controlled import substitution to that of a liberalised market economy and export-oriented growth. The economic discourse centred on the concepts of modernisation, efficiency, productivity and market-governed competition which distinguished it from the earlier ideological precepts of employment generation, equality, social justice and socialism. If a new crop of political managers and economic technocrats who formed the core of Rajiv Gandhi's think-tank and close advisors "known for their decontrol and pro-liberalisation proclivities" [Kohli 1989:312] gave Rajiv's Gandhi's initiatives a pronounced visibility, then the catchy slogan of launching 'India into the twenty-first century' its rhetorical flourish. The image of the regime being truly 'liberalised', especially among the post-independent generation of the elite, was unmistakable.

The signals of the liberal dispensation or rather determination could be deciphered in the very first budget submitted in March 1985 within months after coming to power. The budget offered considerable concessions to the industrial and business classes through a reduction of tax on corporate income, exemption of half of the income from exports from corporate tax net, reduction of import duties on a wide range of intermediate and capital goods, in addition to reduction of public sector bank interest rates and concessions to the salariat by hiking the income exemption limit from Rs 15,000 to 18,000. All these measures are informed

by the proposition that tax reliefs would release resources from the government for productive use by the 'efficient' private sector. Further, the delicensing of 25 industries pointed to the proposed deregulation of industry. Thus, the 1985 budget heralded a beginning towards liberalisation by loosening the hold of the quota-permit raj through tax concessions, import relaxations and industrial deregulation. In addition, the most significant pointer to the liberal turn, at least in ideological terms, was the conspicuous absence of a reference to socialism, a cherished ideological plank of the Congress leaders after independence. This is in sharp contrast to the earlier budgets which had been premised on "the philosophy of democratic socialism, which is the basis of our mixed economy" [Datta 1985]. This cannot but be interpreted as a deliberate avoidance meant to send clear signals to its core constituency of upper class and business elite by a party which has made most of its fortune by swearing by 'socialism' and the poor, even though in the later period more by habit than conviction.

In the context of this new liberalised dispensation, one has to locate concrete policy initiatives like New Textile Policy, New Education Policy, New Exim Policy, etc. It would be pertinent to note that while all these policies were in tune with the liberalisation refrain, the *modus operandi* in their introduction and enactment point to real or perceived responses to the early liberalisation. To cite two extremes of the liberalisation spectrum, while New Education Policy was released for public debate [Mohan 1985], the New Textile Policy was thrust down hastily without any debate. If the new economic policies were part of a demonstrated move away from the goals of social justice, equality and the promise of protecting the weak and vulnerable sections of our society from the onslaught of the dominant and powerful interests, the New Textile Policy (NTP) unequivocally demonstrated the regime's insensitivity to the plight of the handloom weavers, a numerically significant yet unorganised and vulnerable section of our society. Since resistance was expected to be least effective here, the government

showed its determination to push the reforms further.

It is a decade since the NTP was adopted and therefore this is an opportune moment for its critical appraisal. This article attempts to make a critical assessment of the NTP and its impact specifically on the handloom sector. The economic reforms pursued vigorously since 1991 are analytically seen as a continuity, in fact as an attempt at intensifying the liberalisation process initiated during Rajiv Gandhi's tenure, and therefore become critical inputs in the implementation of the NTP.

This presentation is made in six sections. In section II, a critical review of the provisions of the NTP, especially those pertaining to the handloom sector, is attempted. In section III, an attempt to provide an overview of the textile industry by assessing the position of the handloom sector *vis-a-vis* the mechanised mill and powerloom sectors since 1980s and especially after the introduction of the NTP is made. Section IV analyses the crisis in the handloom sector following the policy shift and intensified after the economic reforms were initiated in 1991. Section V deals with schemes introduced as part of the government's response to the handloom crisis and analyses the implicit perceptions and prescriptions. Section VI presents the broad conclusions of this study.

II New Textile Policy, 1985

The handloom sector occupies an important place in the Indian economy as a major provider of employment next only to agriculture. Within the textile industry, it is this sector which accounts for a large proportion of employment, of which the participation of women and children in both the weaving and related activities is quite significant. According to the 1987-88 Handloom Census there are estimated to be about 2 to 2.5 million directly dependent on handloom weaving and another one million on related activities for their livelihood.¹ The weavers' organisations put the figure much higher: according to whom there are about two crore weavers working on 30 lakh handlooms and an equal number engaged in pre- and post-weaving related operations.²

In due recognition of the significant employment potential of this sector, after independence successive governments have both in the plan priorities as well as in the textile policy pronouncements sought to provide a prime place to the handlooms through elaborate safeguards, the most significant being: reservation of articles for exclusive production on the handlooms, imposition of quota and product restrictions on mill sector and discouragement of powerloom expansion through stringent regulations regarding their registration. It is quite a different thing whether these policy commitments were kept in practice in letter and spirit. But what is important to note is that in principle safeguarding the handloom sector has been seen not only as a viable solution to the ever-increasing unemployment problem but also as a means to provide cheap cloth to the poor.

PRODUCTIVITY, MAIN OBJECTIVE

The NTP introduced by the Rajiv Gandhi's government in 1985 marked a decisive departure from the earlier policies not only in terms of priorities and emphasis, but even in the very way of understanding the textile industry. For the first time in the post-independence period, emphasis has been placed on productivity in sharp contrast to the hitherto thrust on employment. Thus it stated:

...the multiplicity of objectives has inhibited the achievements of the *main task* of the textile industry, that is to *increase the production of cloth* of acceptable quality at reasonable prices to meet the clothing requirements of a growing population. Henceforth, the approach to the textile industry would be guided by this main objective [GOI 1985, emphasis added].

Further,

in pursuit of the main objective [of increasing production of cloth], the employment potential of the industry *shall be kept in view* [GOI 1985, emphasis added].

The NTP signalled a disturbing trend with serious long-term consequences. As noted by sensitive observers of the Indian economy, the Rajiv Gandhi regime furthered the divorce between planning on the one hand and budget and specific policies on the other, thereby underscoring "once again how irrelevant the notions of planning and five-year plan priorities to encompass the whole economy are in the concrete political-economic circumstances of the country" (EPW, editorial, April 20, 1985). This scenario has strengthened the view that "planning commission has been systematically demoted" [Datta 1985].

The specific case of NTP clearly demonstrates the distance between the

identified plan objectives and priorities and the objectives of the NTP. The Seventh Plan document [Planning Commission: 1985] promising "an employment-oriented plan" (p x), identified "generation of productive employment" (p 23) as the central aspect of the developmental strategy. Since the "potential of direct employment generation in large-scale industries and in much of the infrastructural sectors is not high because these industries are fairly capital-intensive" (p 24), to generate productive employment in rural areas "intensification of agriculture and village and small industries and diversification of rural economic activity" (p 33) is emphasised. Deviating from this policy perspective, the NTP, as suggested above, has marked a shift from employment to production as well as (as will be shown below) from labour-intensive small-scale industry (with massive employment potential) to capital- and technology-intensive mill sector. Thus, it would not be an exaggeration to state that the NTP has demonstrated this trend which was to get further strengthened with the passage of time.

PROCESS VIEW OF TEXTILE INDUSTRY

The fairly well accepted way of viewing the textile industry and its problems for policy-making and scholarly analysis has

been in terms of sectoral differentiation – the three sectors being handlooms, powerlooms and mills. Since yarn is the principal input for textile production further differentiation of each sector on the basis of fibre use (i.e., cotton, silk, wool and synthetic fibres) is also seen as a useful method of understanding the textile industry. The 1985 policy, without much rationale, had judged the sectorwise and fibrewise policy orientation to the textile industry as leading to the compartmentalisation of the industry and identified it as the cause of "structural rigidities" leading to the emergence of special interests in the industry and its fossilisation. In contrast, it proposed a process-related view of the industry – spinning, weaving and product processing being the principal ones – as the "comprehensive view" and held it as the key to the elimination of the existing structural rigidities, by providing the industry with "fuller flexibility in the use of various fibres" and "pragmatic policies regarding creation or contraction of capabilities by units to increase competition and promote healthy growth". As if to promote competitiveness it promised to open the export window for "cotton, yarn and other manufactures" [GOI 1985:1-3].

Though it is a matter of common knowledge, yet it needs to be emphasised

TABLE 1. POWERLOOMS AND HANDLOOMS

Year	Powerlooms		Handlooms
	Total	Cotton	
1941	11,640	6,750	–
1963	150,000 (1188.66/54)	80,000 (1085.19/53.87)	–
1974	–	–	3,563,363
1975	309,913 (106.61/9.7)	193,097 (141.37/21.94)	–
1981-82	503,000 (62.77/7.78)	328,000 (69.86/8.7)	–
1982-83	600,000 + 160,539 unauthorised pending regularisation (93.60/11.70) (145.40/18.17)*	424,000 estimated (119.57/14.94)	–
1987-88	–	–	3,324,000 (-6.72) [3,078,000 + 246,000] working + idle
1989	1,073,994 (113.52/14.19)	–	–

Notes: Figures in parentheses show gross and per annum percentage of growth in each sector calculated to the year in the preceding row, except for the year 1982-83 the base year is 1975.

* Percentage of growth of powerlooms, inclusive of unauthorised powerlooms.

that only a sectoral understanding would open up the possibility of appreciating the relative advantages/disadvantages individual sectors have in textile production and marketing. On the contrary, any attempt to view the textile industry in terms of the processes would not only overlook or ignore the specificities of each of the sectors – determined by the requirement of raw materials and capital, employment structure, labour conditions, production and marketing structure and consumer demand pattern, etc – but would in fact tend to treat all the sectors to be equal in their ability to compete in the market at various stages. Needless to say, this is not only far from true but in fact would prove to be detrimental to the vulnerable and disadvantaged social groups involved in handloom weaving.

Once the sectoral view of the industry is declared irrelevant, and fostering competitiveness of the different sectors is identified as the key to boosting fabric production and thereby to increasing consumption then from this perspective and objectives emerges a different diagnosis of the problems of the textile industry and the necessary solutions

It would be necessary to note that the contribution of the mill sector to total textile production has steadily declined over the years, while the share of powerlooms has recorded a phenomenal increase. For instance, the five-year period before the NTP, i.e. between 1980-81 and 1984-85, shows a decline of 9.36 percentage points in the mills' share from 37.93 per cent in 1980-81 to 28.57 per cent in 1984-85, while during this period the powerloom share had recorded a 7.64 percentage point increase. The decline in mill production can obviously be traced to the restrictions on capacity and fibre-use, imposition of heavy excise duties, controls on the import of polyester fibre and of technology for modernisation of the mill sector by the earlier policy regimes and of course the resistance of the organised working class to the mill owners' attempt at retrenchment. Though this policy intervention was intended to protect handlooms, its unintended consequence was the expansion of the powerlooms. In contrast, the advantage of low duties, the presence of an unorganised and low paid workforce and the possibility of flouting all kinds of regulations in every conceivable way has benefited the powerlooms. It is against this ground reality that the "proposed restructuring of the textile industry" in the NTP has to be read. The measures to provide "fuller flexibility" in the fibre-use and "pragmatic policies" to increase competition and promote "healthy growth in the industry" are undoubtedly meant for the mill sector. Thus, a Textile Modernisation Fund, soft loan scheme of the IDBI and a Rehabilitation

Fund for workers (i.e., to facilitate easing out of the workers by mills) were envisaged. And the pace with which the government acted on the removal of capacity restrictions, reduction of excise duty, creation of Rs 750 crore Textile Modernisation Fund and of special loan provision for Rs. 100 crore with a mere 6 per cent interest per annum with a six-year moratorium and repayability of 18 years [Jain 1988] not only point to the power of the millowners lobby but more significantly to the ultimate turn of the NTP. While the mill-owners are uniformly the beneficiaries of the modernisation scheme, its brunt had to be borne by the workers as evident in the fact that in the first three years of NTP around 1.8 lakh mill workers were retrenched [Jain 1988]. This trend continued and by the end of the fifth year of the NTP (i.e., from 1985 to 1989) around 567 mills (both spinning and composite) were closed affecting 7.27 lakh workers [GOI 1990:53].¹

Thus, a perceptive policy shift in the 1985 statement from the objective of employment coupled with productivity to the single-most important objective of productivity and from a sectorwise

perspective to a process-related one marked a decisive departure from the past and created a favourable atmosphere for the mill and powerloom sector.

PROMISES TO HANDLOOM SECTOR

The 1985 Textile Policy though it made a major departure from the past by proclaiming *increase in productivity* as the main objective, did not shy away from making profuse promises to the handlooms – "to preserve the distinctive and unique role of the handlooms to enable them to realise their full potential and ensure higher earnings to the weavers" [GOI 1985:4].

The measures intended to preserve the handlooms are:

- modernisation of looms to improve handloom productivity and quality;
- necessary measures to encourage and increase spinning in khadi sector, given its large employment potential;
- ensuring the availability of yarn and other raw materials at reasonable prices;
- encouragement to the production of mixed and blended fabrics on handlooms by making man-made fibre adequately

TABLE 2. PRODUCTION OF FABRICS BY SECTOR

	(in metres)

HANDLOOM RESERVATION ACT

Handloom (Reservation of Articles for Production) Act, 1985 (22 of 1985) reserving 22 varieties of articles for exclusive production in the handloom sector is a major concrete initiative in the direction of protecting handlooms from the powerloom and mill sectors. In spite of the promise made in the textile policy that this act "shall be strictly enforced and the machinery for doing so shall be suitably strengthened" [GOI 1990: 4] the track record of the last decade points to the contrary. The story of this act deserves to be narrated for it clearly illustrates how whatever limited legal safeguards the artisanal communities in our society may have are diluted and rendered ineffective, through a combined effort of the powerful private capitalist vested interests.

Challenged by the powerful lobbies of powerloom and mill owners soon after its enactment and helped by the disinterested response, rather the complicity, of the officialdom, the act remained *sub judice* for eight long years. Thus the implementation of the act was effectively stalled and with the powerloom and mill sector having a field day, the damage caused to the handloom weavers is simply unimaginable. Taking note of the seriousness of the issue the Abid Hussain Committee eloquently recommended that "the reservation for handlooms should be placed in the Ninth Schedule of the Constitution in order to avoid the legal challenge to this legislation"

[GOI 1990: 13]. The committee further noted the urgency to create the necessary institutional mechanism for its implementation. The government simply sat over the recommendation of this 'high powered' committee.

When the Supreme Court finally upheld the reservation of articles to the handlooms in February 1993 the observations it made in its historic judgment (Parvej Akhtar V Union of India) while setting aside the objections deserve to be noted [(1993) 2 *Supreme Court Cases* 221, p 237].

Two major grounds on which this act was challenged were: (a) that the act would lead to the monopoly of the handloom industry; (b) that the act violated the equality clause (Article 14 of the Fundamental Rights) of the Constitution. The fact that reservations in favour of the handlooms have existed since 1950 and that this has "not deterred the growth of powerloom sector in the last three decades" makes the argument of handloom monopoly "totally baseless". Instead, the powerloom production of the handloom reserved varieties, because of the "unequal competition" has "caused a serious inroad into the handloom industry" [SCC, p 237, para 54]. Further, invoking "reasonable classification" criterion to vindicate the equality clause, it justified the reservation act for the protection of the "handloom sector against unequal and powerful competition by the mechanised powerloom/mill sector" [SCC, p 240, para 61].

With this, when the ground was cleared for the execution of the act, the liberalisation regime, instead of implementing the act by creating a proper institutional mechanism to effectively control any further damage to the handloom sector, constituted a multi-member committee to go into the very question of handloom reservations. Thus,

the whole issue in its serpentine sojourn has practically turned a full circle to arrive at the point from where it has to begin afresh.

In any case, the snail's pace of its implementation and the shockingly low number of cases of violations noticed – a mere 656 First Information Reports (FIR) were lodged out of 72,553 powerlooms inspected up to January 1995 [GOI 1995: 12] when violation of the act by powerloom owners is more a norm than the exception – only point to the might of the forces the handloom weaver has to protect himself from.

III

Impact of the NTP: An Overview

Three methods of assessing the impact of the textile policy on the structure of the textile industry in general and on the handloom sector in particular could be identified. They are: (a) the position and number of handlooms; (b) hank yarn availability; and (c) the fabric production in the handloom sector.

HANDLOOM POSITION

The textile industry presents a dynamic sectoral interrelationship. Thus for the assessment of loom position and weaver status in the handloom sector, given its structural disadvantages in the competitive textile market, it is necessary to examine the performance of other sectors. The high-powered committee of the Planning Commission (1974) headed by Shivaraman (hereafter Shivaraman Committee) noted that for every powerloom set up, six handlooms are rendered dormant – which means that for every job created in the powerloom sector 14 handloom weavers are displaced. (It has

TABLE 3: PRODUCTION, DELIVERY AND EXPORT OF COTTON YARN

Figures of cotton yarn delivery for 1987-88, 'Textile Industry – A Profile' (mimeo), Table 7, p 7; for production of yarn, Table 6, p 6.

been calculated that the per weaver productivity in the powerloom sector is 14 times more than that in the handloom sector.)¹

Though the Shivaraman Committee noted the alarming rate of growth of powerlooms (the overall growth rate in powerloom sector being 9.7 per cent per annum and that of the cotton powerlooms being 21.94 per cent per annum between 1963 and 1974) and duly recommended strict restrictions on both the permission to set up new powerlooms as well as on the varieties to be manufactured, the expansion in this sector went unhindered. While there are problems with the data on powerlooms [Jain 1983: 1518] it could nevertheless be noted with some degree of certainty that between 1975 and 1982-83 while the overall growth of powerlooms was 11.7 per cent per annum, the growth of cotton powerlooms was 14.94 per cent. Though in terms of percentage points, the rate of growth of powerlooms between 1975 and 1982-83 was less than that between 1963 and 1975, in numerical terms the growth of powerlooms was phenomenal, that is, by 1982-83 2.3 lakh new cotton powerlooms were added to 1.93 lakh cotton powerlooms estimated in 1975, while with the overall addition of around 2.90 lakh powerlooms the total tally of powerlooms went up to 6 lakh and with another one lakh sixty thousand awaiting regularisation (Table 1). Given the cost effectiveness and price advantage in the textile market that the powerloom products have over handloom cloth, the phenomenal growth in powerlooms could only be characterised as leading to the 'cannibalisation' of handlooms [Jain 1983]. But curiously enough this is not reflected in the available handloom statistics of 1974 and 1987-88. Going by the Shivaraman Committee's estimate, the addition of 2.90 lakh powerlooms should have displaced 17.4 lakh handlooms (at the displacement rate of 6 handlooms per every new powerloom), which in turn means a loss of 41.76 lakh jobs per annum in the handloom sector (at the rate of 2.4 persons employed on each handloom). But the 1987-88 handloom census show a decline of handlooms to the tune of 2.39 lakh and another 2.46 lakh recorded as being rendered dormant. This is a gross underestimation that makes the handloom figures suspect unless one wishes to assume that handlooms coexisted very happily with the phenomenally growing powerloom sector, withstanding the intense competition from the latter.

YARN AVAILABILITY

Another method of assessing the relative position of the different sectors in the industry is on the basis of production and delivery of yarn. Though it would be difficult to

establish how much of cotton yarn has been made available to the mill and powerloom sectors, as far as handlooms are concerned on the basis of the data available on the hank yarn delivery and assuming that all this is converted into cloth on the hand-looms it would be possible to guess how much cloth is produced on handlooms. It is pertinent to note that while the hank yarn obligation of the spinning mills was 50 per cent of the total yarn production, the cotton hank yarn delivered between 1987-88 and 1994-95 never did exceed 26 per cent, instead has declined to 23.10 per cent in 1992-93.

It is estimated that 1 kg of cone or hank yarn yields 10 metres of powerloom or handloom cloth.² Thus the hank yarn delivered should (assuming that all this reached the handloom sector) match with the cotton cloth produced on the handlooms in the proportion of 10 metres per 1 kg of yarn. But what could be found in the data for the period of five years from 1988-89 to 1992-93 (Table 2 and 3) is a gross incongruity or mismatch between the figures of cotton cloth produced and the hank yarn delivered, with the former being many times more than the latter during this period. For instance, in the year 1988-89, if cotton hank yarn delivered was 315 mn kgs the cotton handloom fabric production was 3381 mn metres (ie, the fabric production exceeded by 231 million metres) and by 1992-93 the differential reached a staggering 1206 mn metres with the hank yarn delivered being 348 mn kgs and fabric production being 4686 mn metres in 1992-93. All this in spite of the export of hank yarn far above the ceiling fixed by the government.

The reason for this should not be very difficult to look for. It cannot, by any stretch of one's imagination, be due to the free availability of hank yarn, nor because of the conversion of cone yarn into hank yarn. As a number of studies and reports of handloom committees clearly point out this cannot but be due to the marketing of powerloom cloth as handloom cloth at various stages [GOI 1990, Jain 1983].³

FABRIC PRODUCTION

Now let us turn to the analysis of fabric production, sectorwise. While the cotton fabric production in the mill sector was 41 per cent in 1980-81, it has declined to 28.18 per cent in 1985-86; its decline has been sharper and reached 10.5 per cent by 1992-93. The total fabric production in mill sector also recorded a declining trend: from 37.93 per cent to 9.15 per cent between 1980-81 and 1992-93. The cotton fabric production in the handloom sector during this period has fluctuated between 31 and 37 per cent. In contrast, the cotton fabric production in the powerloom sector has recorded a sustained increase of 26.63 per cent during this period (10 per cent sharp rise in 1989-90). The overall production in the handloom sector has recorded a marginal increase between 1985-86 and 1988-89 but declined by 4.6 per cent in 1989-90 and recovered only marginally in 1992-93. The powerloom sector's total production has been one of steady increase: its proportion has increased from 37.68 per cent in 1980-81 to 66.98 per cent in 1992-93.

Though fabric production statistics clearly establish the extent of decline of the mill sector due to the expansion of the cost-effective powerloom sector, which could also be a consequence of the mill owners' entry into and encouragement to the powerlooms, especially after the Bombay

textile strike in the 1980s. From these statistics it is not possible to estimate the extent of damage to the handlooms. But the widely held view that a substantial part of powerloom production is being marketed as handloom cloth by the proliferating bogus handloom co-operatives set up by powerloom owners to corner loan and market facilities available to the handloom co-operatives may account for the relative steadiness in the handloom production figures.

The conclusions that follow from the above analysis are summed up below.

(i) The massive increase in the total number of powerlooms and especially that of the cotton powerlooms should have logically led to the displacement of handlooms by six times. Instead, the handlooms census figures show a low decline by 1.67 times.

(ii) The decline of handlooms to the tune of 4.85 lakh between 1974 and 1987-88 and of course sudden dormancy forced during the crisis times should logically be reflected in the quantum of handloom production. The fabric production statistics (Table 2) for the period from 1980-81 to 1992-93 and 1993-94 (provisional) show the handloom share to be varying between 21 and 27 per cent in the total fabric production but in absolute terms the cotton handloom production between 1980-81 and 1993-94 has doubled. The total production in this sector has also recorded a two-fold increase from 2,680 million metres in 1980-81 to 5,851 million metres in 1993-94. All this in spite of the fact that during this period 4.85 lakh handlooms have been thrown out of production and the competition from powerlooms has been increasingly felt by the handlooms.

(iii) The yarn figures show the supply of hank yarn to have not only been far below the actual requirement of the handlooms but in fact to have recorded quite wide fluctuations with a downward tilt. Ironically enough, the production figures show wide variance with the hank yarn figures with the former being far higher than the yarn available.

Due to the incongruity or rather illogical variance between the number of handlooms, the quantum of cotton hank yarn availability and total cotton cloth produced, the official statistics not only become suspect but in fact strongly confirm the judgment of Jain that "the hands of the textile commissioner's organisation, which knowingly puts out fictitious estimates of production in the powerloom and handloom sectors are not clean" (Jain 1983: 1517). The only way one could make sense of this is by stating what is by now a fairly well-established fact, that powerloom cloth has been shown as being produced in the handloom sector at different levels – through bogus co-operatives floated by the powerloom owners, and with official

connivance through the manipulation of statistics.

IV Handloom Crisis

The handloom industry in the last decade witnessed a crisis serious in terms of its intensity and expanse. The consequences of this were large-scale displacement of weavers, steady decline in handloom cloth production and of course severe hardships to the weavers in the old age group when they were pushed to starvation while the younger weavers resorted to occupational shift and migration for survival.

It would be improper to talk about this crisis in general terms for its impact has been differentially felt, determined by spatial, organisational and product-related factors. While the weavers in the centres producing colour, jarri, tie and dye, silk varieties and special high value sarees and export varieties could cope up with the crisis, in spite of the initial shocks, largely due to the relatively assured up-market, it is the weavers producing cheap varieties using low-count yarn who had to bear the brunt of the crisis. The most severe crises which received national attention occurred in 1988-89 and 1991.

Central to the crisis in the handloom industry is the scarcity and steep rise in market prices of cotton yarn. Though the 1985 textile policy promised to make special efforts "to ensure adequate availability of yarn and other materials to the handloom sector" implicitly at reasonable prices affordable by the weavers, that was not in fact to be the case as the 1988-89 and 1991 handloom crises, claiming 52 and 110 lives respectively, clearly demonstrated.

The Abid Hussain committee appointed in 1988 to review the progress of

implementation of the 1985 textile policy in its report submitted in 1990 noted with concern [GOI 1990: iii]:

We have identified certain critical problems that continue to plague the textile industry; many of them persist *despite, rather than because of*, the 1985 policy. High and fluctuating prices of yarn imposed great hardship on handloom weavers who suffered as a consequence. (Emphasis added.)

Though, the Abid Hussain report refused to see the relationship between the shift brought about by the 1985 textile policy which identified the promotion of "export of cotton [and] yarn" as one of the priorities and the handloom crisis, it nevertheless did identify "high and fluctuating prices" of yarn as the cause of the crisis. Between 1985 and January 1990 the prices of yarn in 40s and 60s count used by majority of the weavers producing common varieties had increased by 86.95 per cent and 128.57 per cent respectively (Table 4). In contrast to the phenomenal rise of yarn prices, the market rates of these varieties have seen only a marginal increase, thereby rendering their production not only unprofitable but even uneconomical.

The crucial question thus is: why this steep rise in yarn prices? Part of the answer, according to the Hussain report itself, lies in the failure of the government to enforce the hank yarn obligation by the spinning mills

At present spinning mills are requested [sic] it should be 'required'] to produce 50 per cent of their total marketable yarn output as hank yarn. The actual delivery of hank yarn amounts to about 40 per cent of total yarn produced. This has raised two different kinds of problems. First, there are widespread complaints of diversion of hank yarn to powerlooms. Second, the demand for yarn by handlooms is for specific quantities and

Compendium of Handloom Schemes, Development Commissioner for Handlooms, Ministry of Textiles, New Delhi (nd).

counts. Hence, there is often a mismatch between the kind of yarn required by handlooms and that which is supplied. The net result is that the mills feel aggrieved with what they consider is too high a hank yarn requirement, while handloom weavers often face difficulty in procuring adequate quantities of yarn for their requirements [GOI 1990:11].

What is pertinent to note here is that in contrast to the Hussain Committee's assertion about 40 per cent of total yarn production being delivered in hank yarn form, the available data for 1988-89 onwards clearly shows that the delivery of hank yarn was in the range of 22 to 24 per cent (Table 3). In addition, what is lost sight of is the steady increase in the export of yarn from 42.1 mn kgs in 1987-88 to 94.68 mn kgs in 1990-91. It may be noted that within these exports, the proportion of hank yarn in the 20s and 40s counts has constituted more than 64 per cent and has been increasing (*The Economic Times*, April 11, 1994).

ECONOMIC REFORMS SINCE 1991

The economic reforms initiated by the new Congress government at the centre in June 1991 furthered the liberalisation process at work since mid-1980s. One of the principal objectives of the economic reforms package, introduced after the severe balance of payments crisis experienced by the Indian economy in 1990-91, is to boost the foreign exchange reserves. Though it is not within the scope of this essay to go into a detailed discussion of the package, what is pertinent to the understanding of the survival crisis of the handloom weavers is the clearly perceptible attempt in the last five years to increase exports with a view to earn foreign exchange. Two important reforms that have a direct bearing on the yarn crisis or rather led to the escalation of the crisis are trade liberalisation and devaluation of the rupee to boost exports. As far as the textile industry, which contributes significantly to our exports, is concerned, these reforms seem to have encouraged an easy, rather less risky way of earning foreign exchange by exporters through cotton and yarn exports, while the export of value added products would involve trading and marketing skills and related risks which the easygoing parasitical exporters are apparently unwilling to take. The government, in its anxiety to somehow earn foreign exchange like a small-time dalal, has allowed freeplay to this lobby in the name of liberalisation.

Thus from mid-1991, we witness a desperate attempt to allow the export of yarn irrespective of the quantum of yarn production and the domestic requirement. Yarn export rose from 94.68 mn kgs in 1990-91 to 110.99 mn kgs in 1991-92 when

yarn production as a matter of fact decreased from 1,510 mn kgs to 1,450 mn kgs. A matter of serious concern is that in these exports the proportion of hank yarn, most of it being in low counts, was 86.8 per cent (*The Economic Times*, April 11, 1994).⁷ As a result hank yarn prices rose from 18 to 20.5 per cent. To be precise, while the price of 40s count rose by rupees 10 per kg the price rise of 60s and 80s counts was between Rs 21 and 25.50. While the periodic increase in yarn prices is within the experience of the weavers, whose adjustment to it, in the face of market unfriendliness (for handloom product price increase does not match yarn price increase), through a cut in their wages is a story of tenacity and instinct of an average weaver to survive with a bare minimum, a sudden and unexpected spurt in prices is something which pushes them beyond the limits of endurance. It is pertinent to note that the master weavers, producing more than three-fourths of handloom cloth, respond to such crises through a corresponding cut in the wages [Srinivasulu 1994]. As the weavers in Chirala and Mangalagiri narrate, in 1991 the yarn price hike was so high that the master-weavers found it beyond their capacity to continue cloth production. As a result, handloom production was thrown out of gear resulting in a loss of employment for a large number of weavers and in their being pushed to starvation and suicide. This is markedly so in centres with a large concentration of weavers, native and migrant, like Chirala and Mangalagiri. It is from here that a large number of starvation and suicide deaths were reported.⁸

V Policy Response

It is generally suggested that the early years of transition towards economic liberalisation affect the poor and vulnerable social groups adversely, though once it gets stabilised the benefits would also percolate to them. The public policy intervention therefore becomes imperative to alleviate the social costs of transition. The IMF-World Bank prescription has also provided for civil society initiatives, especially through non-governmental organisations (NGOs) in addition to policy intervention. In the context of liberal democracies like India, the political management of liberalisation and economic reforms, given the attendant social costs, necessitates certain degree of accountability and responsiveness through policy initiatives to mitigate its negative consequences [Goetz and O'Brien 1995]. The role of the press in a liberal democratic system in focusing the issues and raising the political and social awareness and thereby bringing

'responsive' governance on to the political agenda, as the experience of the recent past with reference to the anti-arack agitation and more specifically (and relevant to the present discussion) to the handloom crisis shows, is quite significant [Srinivasulu 1995].

In the context of liberalisation, for the above reasons, public policy intervention both through the continuation of certain previous policies and introduction of new policies, becomes imperative. With specific reference to the handloom sector, because of a serious survival crisis of a large number of weavers as a consequence of the liberalisation drive – the deregulation of the textile industry and decontrol of trade in yarn being two significant aspects of relevance here – public policy intervention, in principle, has become necessary. It is not possible to go into all the policies/schemes pertaining to the handloom sector here (Table 4) and we shall focus on those schemes that address certain crucial aspects of the crisis.

YARN SUPPLY SCHEMES

As discussed earlier, central to the handloom crisis is the sudden and unexpected spurt in the prices of hank yarn used in the handloom production. Though the NTP promised "to ensure adequate availability of yarn" to the handlooms at reasonable prices and intended to keep up this promise through the provision of hank yarn obligation by the spinning mills and by preventing its violation by them through its reconversion into cone yarn (used in the mechanised sector) and its diversion to the powerlooms, the handlooms crisis has clearly demonstrated the government's failure in this regard.

As a specific response to the handloom crisis, the government introduced the Mill Gate Price Scheme (MGPS) and Hank Yarn Price Subsidy Scheme (HYPSS). Under the MGPS while the yarn supply target was 10 mn kgs, the yarn actually supplied to the weavers during 1992-93 was 1.6 mn kgs during 1993-94 it was 4.94 mn kgs. The HYPSS provided for the supply of 20 mn kgs of hank yarn with a subsidy of Rs 15 per kg to the weavers in the co-operative sector. It must be noted that the fund of Rs. 30 crores allocated to this scheme was in fact carved out of the budgetary provision for the Janata Cloth Scheme (JCS). Even this scheme, in its implementation, failed to make yarn available to the distressed weavers, if the AP experience is any indication. According to Pragada Kotaiah (*The Hindu*, December 26, 1995) no yarn was supplied to the weavers in AP under this scheme. While the per annum requirement of hank yarn in the country is around 460 to 480 mn kgs, the yarn supply target under these two

schemes is a mere 5 per cent of the total requirement.

LOOM DISTRIBUTION

While the liberalisation regime on the one hand explicitly resorted to expenditure and subsidy cuts to different sectors like public health, education in the name of reducing fiscal deficit, it unhesitatingly pronounced substantial subsidies for notionally irrelevant and practically useless schemes on the other hand. The scheme of providing loom to the loomless weavers, when the priority should have been for providing hank yarn, is a clear instance of irresponsible behaviour. This scheme, conceived by the ministry of textiles in consultation with the ministry of rural development in 1993, earmarked Rs 523.20 crore with a subsidy component of Rs. 130.80 crore from the IRDP phased over three years from 1993-94 with a target of 1.09 lakh looms per annum (*Compendium of Handloom Schemes*, p 23-44).

The basis for this scheme is the National Handloom Census conducted in 1987-88, according to which there were 3.27 lakh loomless weavers in the country. It is pertinent to note that in the last couple of decades there has been a steady but definite decline of the independent weaver system and also of the co-operatives. This decline has been largely due to the unequal competition from the powerloom sector and its relatively cheap and affordable cloth flooding the rural markets. The hike in raw material prices in contrast to the relative stagnation in the handloom product prices has increasingly tilted the economies of scale in favour of the powerloom sector. Unable to cope up with the adversity of the emerging scenario, the vulnerable independent weavers have either resorted to an occupational shift (especially in the younger age groups) or settled with the master-weavers as wage earners. Obviously this meant large-scale migration of the weavers to the major handloom centres. It is these uprooted (from their native villages) migrant weavers who account for most of the 3.27 loomless weavers. In other words, they have been rendered 'loomless' in the context of a survival crisis leading to the decline in the independent weaving sector.

The clue to the magnitude of migration and occupational shift among the weavers could be found in the Handloom Census itself – that is, in its discovery of 2.79 lakh idle looms in the country. In view of this reality, the introduction of a scheme to distribute looms can only be considered either as an act of madness or of wilful destruction of the handloom sector.

It would be innocent to imagine that the policy-makers are oblivious of the state of

the handloom industry, as the following extract from a government order brings out clearly:

The handloom census was done about six years ago. The ground realities might have materially changed since then. It is likely that many loomless weavers might have taken to some other vocations. It is necessary to ascertain the exact number of loomless weavers in each major weaver concentration, who need to be covered by the proposed package under the IRDP. This task may be entrusted to the block development officer or any other block level coordinating agency functioning at that level. The association of the field staff of the Directorate of Handlooms and the Industrial Department of the state governments should be completed in about a month's time and a list of all eligible loomless weavers, who are below the poverty line, drawn up for per cent coverage under IRDP. [GOI nd: 27-28, emphasis added.]

This package, in reality, would only be adding another 3.27 lakh looms to the 2.79 lakh idle looms as on 1987-88 and many more that could have been forced to be idle in the intervening years. Given this, no sensible weaver can be expected to show interest in possessing any loom without raw materials and as with most of the IRDP schemes, this scheme's fate is predetermined in its conception itself.

HANDLOOM DEVELOPMENT CENTRES SCHEME

Another scheme announced in September 1993 deserves to be examined both for its generous promise and a whopping cost of Rs 849.15 crore it involves. Under this scheme 3,000 Handloom Development Centres (HDCs) and 500 Quality Dyeing Units (QDUs) are to be set up with an assistance of Rs 27 lakh per QDC and Rs 7.83 lakh per QDU and phased over four years starting from 1993-94 and completed by the end of the Eighth Five-Year Plan. What is fantastic about this scheme is its promise to provide a complete package of assistance to the handloom weavers in an integrated and co-ordinated manner by "bringing 30 lakh weavers with 7.5 lakh looms in the co-operative fold so that the benefits of all the various schemes accruing to the handloom co-operative are available to them". Thus the weavers covered by HDCs would be provided with the raw materials, ie, yarn and dyes, training in improved dyeing and designing, and marketing of the production. [GOI nd: 1-22]

The pace at which this scheme has been implemented, as the figures for the first two years show, runs contrary to its lofty promise. While during 1993-94 only 267 HDCs and 66 QDUs were sanctioned at a cost of Rs 10 crore, during 1994-95 around

605 HDCs and 134 QDUs were sanctioned with Rs 40.18 crore. These figures are uniformly far below the targets set.⁹ In AP, for instance, where during this period 80 HDCs and 36 QDUs with 6.61 crore were sanctioned these centres have yet to start functioning. If the experience of Andhra, where periodic crisis received immediate attention, is any indication one can very well imagine the situation in other states.

Of more serious concern than the lackadaisical implementation of the schemes is the bureaucratic prescription of ill-conceived schemes involving massive public funds that besides not addressing the key problems may even cause further damage. Thus when the solution to the handloom crisis is simple and straight, that is making yarn in necessary counts available in required quantities at reasonable prices to the handloom weavers, the government has come up with irrelevant policies that seek to provide looms to the weavers and promise marketing of production by weavers in HDCs. One even shudders to imagine the only possible consequence of this kind of prescription, which is to snap whatever linkages with the local market the handloom sector may have retained despite the threatening inundation by the powerlooms.

When the impasse-ridden Reservation Act (discussed in Section II) and the inconsequential attempts at yarn supply are read with the high priority HDC and loom schemes, the real intent of the policy intervention with respect to the handloom sector becomes suspect.

VI Concluding Remarks

In this essay an attempt is made to analyse the context, text and impact of the 1985 Textile Policy on the handloom sector. In contrast to the dominant functionalist perspective in the field of policy study, which basically reduces policy analysis to policy evaluation and/or impact assessment, in this essay the attempt has been to view the NTP in the larger context of the economic policy shift to liberalisation brought about during Rajiv Gandhi's tenure. The contextual reading of the policy highlights the fact that in the chequered course of liberalisation of the Indian economy, traced to the mid-1980s, it is with regard to the sectors of the economic activity where the resistance to the new economic policies is weak that the governments sought to push the reforms further.

The study of the NTP clearly shows the increasing gap between the Five-Year Plan priorities and specific policy priorities, thereby strengthening the view that planning may become irrelevant in the context of liberalisation. Thus while the Seventh Plan

identified employment generation as the foremost objective of economic planning, the NTP in contrast by treating productivity and efficiency as the priority concerns sought to create a level playing field by removing hitherto existing restrictions on the mills and powerlooms, meant to protect the large-scale employment – actual and potential – in the vulnerable handloom sector.

In the context of the liberal dispensation of the regime, with productivity, efficiency and market competitiveness being its important catch phrases, the protection and policy package to the handloom sector in a sense becomes a contradiction in terms. Textile being a major sector of industry and the powerful mill and powerloom lobbies constituting a major faction within the ruling class coalition, and the pro-liberalisation elite predominating in policy-making bodies, the major hurdle at the policy formulation and implementation level for the powerful textile lobby is largely removed. If the NTP is evidence of this influence at the policy formulation level, whatever safeguards are provided to the handlooms (apparently as a matter of habit) are sought to be diluted through indifference, delay and inaction. The series of hurdles – legal and other – and the inordinate delay in creating an implementing mechanism for the execution of the Handloom Reservation Act clearly illustrates this. In contrast, the artisanal communities engaged in handloom weaving, in spite of their numerical strength, could show only a limited capability for protest and resistance and they fail to be heard and their limited organisation fails to threaten the electoral prospects of the governing elite.¹ The ineffective policy initiative and disinterestedness and indifference to the implementation of the existing policies are largely due to the disorganised nature of the handloom industry.

Notes

[I am very grateful to L C Jain for his encouragement and generous support, and also for his encouraging comments on this paper. I am thankful to S Pandari and K J Rama Rao for helpful discussions and to Jyothi and Uttam Kumar for research help.]

- 2 All India Handloom Weavers Convention (Open Session), welcome speech by Rahmatulla Ansari, February 20, 1993, p 3.
- 3 Since the launching of the new economic reforms in 1991, the closure of the mills got a further fillip: between 1991-92 and 1993-94, 385 mills were closed and as a result

5.45 lakh employees were affected (*Annual Report 1994-95*, Appendix-IX, p 69).

- 4 An important study conducted subsequently for the Planning Commission further assessed that in the mill and powerloom sectors, while the capital required per unit cloth output is highest, the employment generated is lowest; in the case of handlooms the converse is found to be true – the capital required being lowest and employment generated highest [Anand 1978-79].
- 5 'Report of the Working Group on Textiles for the Plan 1978-83', Ministry of Industry, 1979, cited in Jain (1983: 1518).
- 6 There is a proliferation of bogus co-operatives floated by master-weavers both in the handloom as well as powerloom sectors to corner the yarn, credit and marketing facilities available to the co-operative sector. It is these co-operatives, controlled entirely by a few families who resort to what seems to be a widely prevalent practice of marketing powerloom cloth as handloom cloth. For a detailed account of the phenomenon of bogus co-operatives in Chittoor district in Andhra Pradesh, see 'Study of the Handloom Weavers Co-operative Societies in Chittoor District', prepared by Rural Institute of Social Education (RISE), Tirupati.
- 7 In spite of severe yarn crisis and protests, exports of low counts used in the handlooms continued almost uninterrupted. As per the latest yarn export data, in 1995 while the total yarn export was 243.87 thousand tonnes, the share of yarn in the 1-40s count was as much as 203.42 thousand tonnes (Texprocil).

Interpreting Madhya Pradesh Voting Patterns

Christophe Jaffrelot

In his comments on my article on the Madhya Pradesh assembly elections of 1993 ('Madhya Pradesh: Setback to BJP', *EPW*, January 13), Rahul uses strong words such as 'unscholarly' ('MP Assembly Elections, 1993', *EPW*, April 6). He begins by disagreeing with the way I divide Madhya Pradesh into political regions, something one has to do in order to identify swing-zones as he himself emphasises. For my part, I rely by and large on the traditional subdivision into five regions: on the one hand, Chhattisgarh and Mahakoshal (which were part of the Central Provinces of British India before 1947), and on the other, Madhya Bharat, Vindhya Pradesh and Bhopal (which are made up of former princedom combined into three separate states shortly after independence and merged in 1956 in the new Madhya Pradesh).

In a more recent article, Rahul argues that this division "reflects the grouping of princely states into *temporary administrative* units prior to the formation of Madhya Pradesh in 1956" (Rahul, 'The Meek Lay Claim to Their Inheritance: Portents of the 1996 Election Results from Madhya Pradesh', *EPW*, June 29, p 1685; emphasis mine). But this is not so simple: well before 1947 these five regions had acquired quite different personalities, depending primarily on whether they belonged to British India or to one of the princely states. The political culture evolved in the former was radically different from the conservative atmosphere typical of the latter. More importantly, many princely families continued to play an important role in their former territories after independence, sometimes up to the present day. This is something one has to take into account in drawing a *political* map of Madhya Pradesh. Hence my strong reservations about the way Rahul divides Madhya Pradesh into eight regions: Chambal, Bundelkhand, Gondwana, Chhattisgarh, Mahakoshal, Bhilistan, Malwa and Bhopal. He mixes together districts which were part of British India and others which belonged to princely states. What is the political rationale, for instance, behind the inclusion of Sagar – a district which had been part of the Central Provinces from 1861 onwards – in Bundelkhand, where former princely states are in a majority? It seems that Rahul is interested in shaping geographical, socio-economic and/or socio-cultural regions rather than political regions. This is particularly clear in the case of Gondwana, the main Gond-

inhabited area, which he constructs by putting together districts of 'traditional' Chhattisgarh, Vindhya Pradesh and Mahakoshal. But is it of any use for analysing political processes such as elections? He himself recognises that "there have been attempts by the Gond to organise along ethnic lines but due to a large absorption of the Gond intelligentsia into the government bureaucracy these attempts have not really succeeded so far" (p 1689). Rahul's map is all the more strange as he himself recurrently emphasises the role of historical and political factors. He points out the role of princes such as the Scindias and the Rewa family in their respective areas (p 1691). In the same perspective, he explains that "the politicians from Chhattisgarh have been traditionally dominant in state politics because of their experience of parliamentary democracy from the British times..." (p 1690).

In a way, I find the 'traditional' map of Madhya Pradesh vindicated by this kind of argument and prefer to merely amend it by dividing Madhya Pradesh into two parts, the Gwalior area, where the Scindias still exert a strong influence, and Malwa. (For other minor amendments, the interested reader can look at my book, *The Hindu Nationalist Movement and Indian Politics, 1925 to the 1990s: Strategies of Ideology Building, Implantation and Mobilisation with Special Reference to Central India*, Viking, Delhi, 1996.)

Rahul's second criticism concerns my analysis of the Hindu nationalist 'welfarist strategy'. He chooses to ignore its tactical dimension and to ironise with respect to the contradiction between this strategy and Patwa's anti-poor policy (on which I dwell

in my article). In fact, one has to differentiate the actions of the BJP government in 1990-92 from the grass roots level work of the RSS and certain of its offshoots, such as the Vanavasi Kalyan Ashram which has entered tribal areas and propagates Hindu nationalist ideas under the garb of social work. Rahul implicitly admits this in his subsequent article: "The BJP ably aided by the RSS has worked tirelessly to woo these sections [the tribals, the dalits and the OBCs] and succeeded in forming a committed cadre even in the remote Naxalite controlled areas of Bastar" (p 1690). He himself differentiates the BJP's activities from the work of other organisations of the 'Sangh parivar' when he writes: "The BJP could emerge as a force precisely because the RSS systematically began cultivating the OBCs and later dalits and tribals to capitalise on the resentment among these sections at the policies being pursued by the INC" (p 1692).

In his comment on my paper, Rahul is highly critical of the fact that I paid little attention to the Chhattisgarh Mukti Morcha and other organisations which "make the non-party political process in MP the most vibrant one in the country in terms of mass base, militancy and the formulation of alternatives to the prevailing forms of development and governance" (p 908). But in his article, he himself points to the failure of one of the CMM candidates, Janaklal Thakur, and concludes: "His predicament underlines the marginality in electoral terms of the people fighting for an alternative development model as the basis of a more participative policy in the state. Four other candidates of the CMM fared even worse" (p 1690).

Thirdly, Rahul says that I naively overestimated the unity of the Congress at the time of the 1993 elections: "The Congress is definitely not the well-organised party that CJ would have us believe it is..." (p 907).

GOVIND BALLABH PANT SOCIAL SCIENCE INSTITUTE

Jhusi, Allahabad-221 506

CORRIGENDUM TO THE ADVERTISEMENT NO. 1/1996 Published in the month of July, 1996 regarding Academic Positions

Further to the above mentioned advertisement it is clarified that the directives of the Indian Council of Social Science Research, and the U.P. Government with regard to reservation for SC/ST/OBC categories are admissible.

Desirous persons of these categories who had not applied earlier may apply on plain paper latest by December 31, 1996 submitting detailed biodata, names of three referees, copies of three best publications, academic work plan for next two years and SC/ST/OBC certificate.

REGISTRAR

I certainly did not try to give this impression but merely indicated that factional fights were less in evidence within the Congress on this occasion, reporting that 'leaders made peace', that we saw during one of the pre-election meetings "the beginning of a more harmonious relationship" and that "on balance things went rather smoothly this time" (p 132).

In effect Rahul's later article contradicts some of his earlier arguments in his comment on my article and supports some of mine. But this article also includes a number of questionable statements such as, "the Scindias being Marathas are much more civilised compared to the descendants of the Chandelas of Khajurao fame..." (p 1688).

While Rahul rightly argues that the representation of the OBCs among the MPs of Madhya Pradesh increases, this analysis is not fully supported by the accompanying table which utilises a hodgepodge of categories such as Muslims, scheduled castes, scheduled tribes, OBCs, upper castes and women. The implication is that women do not belong to any caste or religion. In fact, among the five female MPs elected in 1996, three belong to the upper castes, one to the scheduled tribes and only one to the OBCs.

The mistake Rahul points out in my table (p 130) is regretted: 34 is not the number of assembly seats in Malwa but the number of seats won by the BJP in this area, out of 63.

postmodernism, the former will definitely be shaken to its roots and there is no way to reconcile it with the latter. Shome et al, I am afraid, have not really explored the implications of invocation of a postmodernist epistemology.

I wind up with a final comment. Shome et al in their endeavour to enlighten economists decide to devote one or two paragraphs to each of the following: Adorno, Vasco on Habermas, Foucault, Lyotard, Wierzbicka, and so on, and thereby completely neglect the literature that has recently come up to deal with the connection between economics and postmodernist epistemologies. For the last couple of years, several authors have been pursuing the alternative paths created by postmodern approaches with great vigour and, in the process, have been expanding the horizon of economic enquiry much beyond stale repetitions of logical positivism. This is evident from such contributions as McCloskey (1985), Klammer (1984), Samuels (1990), Amariglio (1990), Ruccio (1991), Mirowski (1991) and others. It would have been better had Shome et al taken note of this growing literature before they took up the task of enlightening fellow economists.

Quantitative, Qualitative and Postmodern Epistemology

Achin Chakraborty

IN their article 'Quantitative and Qualitative Methods of Social Science Enquiry' (EPW, July 27), Parthasarathi Shome, Carlos J Moreno and Kavita Rao discuss the possibility of "a blend of the quantitative and qualitative approaches for comprehending and predicting human behaviour". Their principal suggestion is that "a qualitative dimension has to be added to economic enquiry". This is unassailable as far as it goes. I fail to see, however, how they can possibly make this prescription on the basis of their epistemological invocation. Although they devote a subsection to 'Knowledge and Postmodernism', ostensibly to "illuminate ourselves - economists - of the views of researchers in other social sciences on epistemology and the nature of knowledge", it is not clear to me how the discussion in this subsection stands in relation to the particular empiricist epistemology the authors put forward.

To begin with, Shome and others are mistaken in emphasising that criticisms and counter-criticisms of the two approaches (what they call 'quantitative' and 'qualitative') bear traces of "comparisons and contrasts between the so-called modern and postmodern approaches". What I wish to emphasise is that there is no *necessary* connection between the qualitative approach in general or the ethnographic approach in particular and postmodernist epistemologies. While the ethnographic approach can be made consistent with postmodernism, it can be shown to be equally consistent with an empiricist epistemology. In what follows, I make an attempt to relate the methodological prescription of Shome et al to postmodernist epistemological positions as I understand them.

Let us start from the classical question of philosophy 'how do we know what we know?' Attempts to answer this question throw up different epistemological positions. On reading the article under discussion I am under the impression that the authors posit the difference between the qualitative and quantitative approaches as something fundamental in nature from the epistemological point of view. I wish to make clear my strong difference with them on this central point of their article. Of course, there could be numerous ways of knowing, but, from the philosophical standpoint, a meaningful position might be one which would designate the two most important of the alternative ways as empiricism and rationalism. Needless to say, both come under the modernist epistemological tradition. It seems to me that Shome and others' methodological prescription falls very much in line with the empiricist epistemology.

By the empiricist epistemology we mean the understanding of theory as a more or less adequate representation of an independent 'reality'. This reality is presumed to be more or less capable of revealing its structure (or essence) through the medium of sensory observation or 'experience'. This assumption is implicit throughout the article. All the arguments Shome et al put forward mean to reveal the inadequacy of the quantitative approach alone in representing the reality. But they nonetheless endorse the empiricist position of the possibility of representing the reality. In presenting what I would call a 'sceptical empiricist' position, one should not confuse this position with postmodernist epistemologies. If a sceptical empiricist position is sought to be informed by

SEPHIS

Sephis Grants Programme

Under the sub-themes of 'The Forging of Nationhood & The Contest over Citizenship, Ethnicity and History' and 'Equity, Exclusion and Liberalization', Sephis will pay special attention to the search for new identities and visions on development which arose in the South

► Fellowships for Post-Doctoral Research

In 1997, six fellowships are available for Post-Doctoral research. Funding will be provided for travel and research costs, and salary according to local standards. These fellowships extend from a minimum of three months to a maximum of two years.

Eligibility: Scholars who have received their PhD degrees, preferably within the last five years, and who are employed by or affiliated to a university, a research institute, or development agency in the South

► Grants for PhD research

In 1997, ten grants are available for PhD research. PhD grants will be provided for a period from one to three years. The proposal must include a period of research and should make clear that the applicant can realistically complete his or her draft thesis in the given time. Salaries are normally not included in the Sephis PhD grants

Eligibility: PhD students enrolled at a university in the South, who are supported by their institution.

► Applications for these grants should include:

- a research proposal (*maximum* of 4 pages prefaced by an abstract of 100 words) presenting the research problem and research methodology (including the sources to be examined), reviewing the relevant literature, and indicating the relevance of the research to one or both of the Sephis themes;
- an academic curriculum vitae;
- a letter testifying to institutional affiliation,
- a referee's report (report sheets

The South-South exchange programme for research on the history of development

can be obtained from the Sephis secretariat),

- a budget,
- a timetable

In addition, applications for Post-Doctoral grants should include:

- an indication of the form of publication (book, article etc.);
- a copy of the PhD certificate.

In addition, applications for PhD grants should include:

- a letter of recommendation by the thesis supervisor

Research proposals will be selected by the Sephis Steering Committee, which consists of historians from different regions in the world. The applications will be evaluated according to *academic quality, relevance to Sephis themes, comparative potential, and contribution to South-South co-operation*. The application must be received before **April 30, 1997**.

Applications should be written in English. Incomplete applications, applications by fax or e-mail and/or too lengthy applications cannot be taken into consideration

The application – and all requests about the grants programme – should be sent to:

Urban Poor as a 'Problem'

In the years between the two world wars, the large urban centres of Uttar Pradesh witnessed unprecedented migration of rural labourers and poorer cultivators. The migration brought into being a large underclass of the poor in the towns, swelling the ranks of the labourers and petty traders already there. The urban propertied classes perceived the poor not only as a potential source of urban disorder and crime, but increasingly also as a threat to their own health and well-being. This precipitated major changes in the policies of the urban local bodies manned by municipal councillors elected by propertied rate-payers or nominated by the government. The policies contributed significantly to the creation of the 'problem' of the urban poor, both materially by intensifying the scarcity of housing for them or impairing their sources of livelihood and discursively by categorising them as a distinct social group defined by their undesirable habits and practices. 3245

Changes in Tastes and Food Demand

Food demand in India has been characterised by changing preferences. An analysis of state-level demand based on the linear expenditure system suggests that consumers are switching away from cereals towards more expensive milk, poultry and meat products. 3265

Development Policies: Lessons from Vietnam

Vietnam has recorded remarkably high growth rates in recent years while ensuring equity and national predominance by adopting policies that balance the roles of the party, the state and the private sector. An overview of the most important political developments in Vietnam since 1986 leads to the conclusion that the current changes will help Hanoi defend its sovereignty, not only in economic, but also in cultural and political terms. It seems likely that Vietnam will develop in tandem with China but with a lesser role for the party in state affairs. 3255

Bogus Debate

The debate on biotechnology and bioethics on Indian platforms thrives on rhetoric and metaphors directly lifted from the West. India cannot evaluate genetics or any other science in such a manner; it will have to create its own paradigms answering its social needs. 3231

High Cost of Reform

The financial sector reforms introduced as part of economic liberalisation have done the economy more harm than good. The initiatives now being taken by the United Front government appear to appreciate this point. 3237

Even as company finance studies clearly show how mounting interest costs are having a severe impact on corporate performance, all aspects of financial sector liberalisation preclude any significant lowering of interest rates by banks and financial institutions. 3218

Dispossessing Tribals

Government policies, ostensibly aimed at protecting the rights of tribals to their livelihood, in fact dispossess them of their access to local resources. 3227

The state marketing agency in the Kandhamal division of Orissa has stopped buying and marketing plates made from 'siali' leaves, a minor forest produce and the tribals' only means of livelihood. 3230

Backward Maharashtra

Maharashtra's backward regions - Vidarbha, Marathwada and parts of the Konkan - have suffered not only because of sheer neglect, but also because the growth model of Western Maharashtra is being foisted on regions with altogether different agroclimatic and socio-political features. 3233

From Tashkent

While regional compulsions brought together six Turko-lingual states to sign a declaration of solidarity and co-operation at Tashkent, much depends on how they can reconcile their differences arising out of their very different economic histories. 3235

Crisis of Narmada

WE the undersigned wish to express our deep concern over the state of the Narmada. The river has been at the centre of a controversy for more than three decades with reference to the gigantic dams being constructed on it. These dams were conceived in an era when India's democracy was in a nascent stage. The right of ordinary men and women to participate in the making of decisions, which were going to affect their lives, had not yet become an acknowledged ideal. Also, the violation of human rights and the risk of ecological destruction had not become matters of public anxiety.

This original context of the vision of Narmada's development has greatly changed today. The human and ecological consequences of big dams stand revealed in many parts of the world. Construction of big dams has been banned in certain countries; in some cases a dam already under way has been abandoned.

In the context of Sardar Sarovar, the Narmada is facing a terrible crisis today. Its personality as a river is under an unprecedented threat. The life-sustaining capacity it has had for thousands of years will be radically curbed, and in some parts decimated, as a result of the topographic transformation of its valley that the Sardar Sarovar dam will induce. The life it nurtures includes that of lakhs of human beings. They have inhabited the valley since ancient times, giving rise to strong cultural traditions and a sense of identity.

As it happens, these people are supposed to enjoy special rights in India's democratic order as constituted by law, having been designated as tribal people. The scale on which the Sardar Sarovar will displace them and other communities is so huge that no amount of planned rehabilitation can prove adequate and just. The rehabilitation that has so far been undertaken amply shows the perversity inherent in the idea.

Apart from the damage that the Sardar Sarovar will do to the natural environment and human communities, the dam will also destroy a precious source of archaeological study into India's pre-historic past. We have taken note of the appeal made in this context by the association for the study of history and archaeology earlier this year.

In our judgment, limited knowledge and vision should not be allowed to justify the inertia that decisions once made necessarily cause in public policy. A vibrant democracy depends on the willingness of those in authority to take a second look. There is an urgent need to bring the Sardar Sarovar project under a comprehensive second look. A wide-ranging environmental study, assumed to have been done but actually overdue, must form a part of the wider

review we are suggesting. Apart from the study of potential seismological effects and the health hazards that the reservoir is certain to cause, the review must probe the cultural, psychological and economic consequences which the project might bring for lakhs of residents of the Narmada valley and the nation as a whole. The experience of rehabilitation work undertaken so far should also be evaluated with the participation of the displaced people in the Sardar Sarovar and the Bargi regions of the Narmada.

We feel that the stay on further construction of the Sardar Sarovar dam granted by the Supreme Court about one and a half years ago provides a highly reasonable opportunity to the government for initiating a comprehensive review. We also hope that the honourable court will visit the actual site of the Sardar Sarovar project before taking a decision on the public interest case pending before it.

Constitution of Finance Commissions

VINOD VYASULU'S contention ('Finance Commission in a Federal Set-Up', October 5, p 2719-21) that the president need not be bound by the advice of the council of ministers (Article 74) while acting under Article 280 appears somewhat misleading. As is evident under our constitutional dispensation, the position of our president is like that of the king of England, i.e., he is a nominal head of government and though the executive powers of the union are vested

in him (Article 53) these powers are to be exercised in accordance with the provision (Article 74) of the Constitution.

Yet the debate that Vyasulu initiates regarding the selection procedure for constituting the Finance Commission cannot be regarded as unwarranted, especially when the awards of the FC and the transfer of Plan Funds benefit/affect states. The big question is how to select members of FC. How are the states to be given a meaningful representation in the FC to safeguard their interests? One way could be what the Expert Committee on the Financial Provisions of the Constitution suggested. It said: "While we would not lay down any condition in the statute as to how these members should be selected, we recommend that two should be selected from a panel of nominees of Unit government and two from a panel of nominees of central government, the chairman being selected by the president himself."

But this is all about the composition of FC. It does not provide any guidance about the actual procedure of selection. Under Article 280(2) parliament can determine the manner in which members shall be selected and, to determine the manner, parliament did enact the Finance Commission (Misc) Act 1951 which is however found not specifying any procedure for selection of members. This however provides us an option of resorting to a supportive enactment under Article 280(2) and removing the insufficiencies of the Act of 1951. This does not necessitate a constitutional amendment nor expecting our president to act as a free agent which is contradictory to spirit and provisions of the Constitution and only initiates a meaningless debate.

Ninth Plan: Marketist Dilemmas

THE United Front government has one more self-created problem on its hands: that of finding the notional resources required for a Ninth Plan in the making. The yet-confidential draft Approach to the Plan has already run into a controversy involving different arms of the government. With the prime minister having directed the Planning Commission to set itself a 7 per cent per annum growth target, the Commission has estimated the required investment rate to average 29.6 per cent of GDP in the Ninth Plan compared with just 25 per cent in the Eighth Plan. Further, budgetary support for the Plan has been placed at Rs 3,75,000 crore.

It is the latter figure which has ostensibly provoked the finance ministry into declaring that the proposed Plan is overambitious. Given its own preference for IMF-style fiscal stabilisation, which involves tax cuts on the one hand and a reduction in the fiscal deficit to 4 per cent of GDP on the other, the finance ministry sees the budgetary support target as being unrealisable. However, given its claim made in the *Economic Survey 1995-96* and the *Update* on that survey issued prior to the 1996-97 Budget, that the economy is fundamentally sound and poised for take-off, it cannot but go along with the 7 per cent growth figure. The Finance Ministry would therefore like the Planning Commission to emphasise the belief that market-induced efficiency would deliver more output from a given volume of investment and that liberalisation would stimulate the private sector into providing the savings and undertaking the investment required by the growth target. It is not the growth rate or the required resources that it demurs about, but the share of such resources that are expected to be provided by the exchequer.

Planners having to make defensible projections can hardly sell such hype. Therefore the Planning Commission has put much of the saving and investment burden on the public sector. Under the 7 per cent scenario, the Planning Commission expects that the domestic saving rate would average 27.2 per cent of GDP in the Ninth Plan compared with 23.7 per cent in the Eighth Plan and that access to foreign saving would rise from 1.3 per cent of GDP to 2.4 per cent. The rise in domestic saving is to be realised through a sharp reduction in government dissaving from -1.9 per cent of GDP to -0.2 per cent, a rise in public enterprise saving from 3.5 per cent of GDP to 4 per cent, a rise in the savings of the corporate sector from 3.7 per cent of GDP to 4.5 per cent and a rise in the household saving rate from 18.4 to 18.9 per cent of GDP. Since the job of raising public saving or reducing government dissaving is handled by the finance ministry, the Commission has in essence placed the difficult task of squaring a marketist-cum-monetarist ideology and a high growth target in the finance ministry's court.

The Commission provides a defence for this aspect of its exercise, which is in keeping with marketist requirements. In its view a greater role for the market does not imply a smaller role for the state, which must 'facilitate' the autonomous, market-driven process of growth with supportive investments and the limited intervention needed to deal with 'market failure'. Since

"market failure is acute" in sectors such as agriculture, infrastructure, the social sectors and technology, public expenditure must remain high if growth is to occur and a semblance of equity is to be ensured.

This 'strategy' of making the state and the market work in tandem, however, has its fair share of problems. First, the Planning Commission's estimates of the quantum of resources required for such a strategy appear to be excessively optimistic. The incremental capital-output ratio (ICOR) on which these estimates have been arrived at is identical to that which, according to the Commission, prevailed in the Eighth Plan, viz, 4.2 per cent. That calculation assumed growth in the current year to be 6.6 per cent and that in the Eighth Plan period (1992-97) to be 5.9 per cent. Present trends indicate that actual growth in 1996-97 will be much lower than the assumed 6.6 per cent. In any case, since 1991-92 recorded a structural adjustment-induced fall in the rate of growth of output, its use as base year would exaggerate growth trends and therefore bias the estimated ICOR downwards. Thus if we use the available firm estimates of output and investment for the quinquennium 1991-96, the ICOR works out to be 5.3 per cent. This not only points to a post-reform increase in the ICOR, when compared to the average figures of 3.9 and 3.8 per cent which prevailed during 1981-86 and 1986-91, but also to a much higher resource requirement for the Ninth Plan than estimated by the Planning Commission. As a corollary, even the 2 per cent rise in government saving projected by the Planning Commission would prove inadequate for the state to play its role.

Second, given the finance ministry's commitment to low tax rates even the 2 per cent public saving figure can be ensured only with a substantial reduction in current expenditure, which would inevitably involve cuts in social sector expenditure. This implies that the 7 per cent growth scenario would be associated with lower social sector spending during the Plan period, which makes nonsense of the Planning Commission's "growth with equity" slogan as well as the many promises which the United Front government has made in its Common Minimum Programme.

Finally, to finance the public sector investment estimated in the 7 per cent scenario the Planning Commission takes the public sector borrowing requirement during the Ninth Plan to remain at the Eighth Plan level. While this goes contrary to the finance ministry's commitment to a reduction in the fiscal deficit, the Planning Commission does not question the validity of that obsession with the fiscal deficit.

Thus, the government's approach of attempting to promise higher growth and more equity than its predecessor, while persisting with the marketist and monetarist legacies left by the previous regime is fundamentally self-contradictory. The marketist dilemmas being faced by the finance ministry and the Planning Commission are mere symptoms of that deeper malaise. By choosing to skirt that issue, the Commission has reduced the Approach document to a padded exercise in middle-school arithmetic.

Mounting Pressure

ANY sign of thaw in relations with China or Pakistan immediately alarms the Indian jingoist politicians and the hawks in the army. Both have developed stakes in the continuation of the policy of brinkmanship.

The recent visit of the Chinese president, Jiang Zemin, to India and the agreement arrived at by the two governments to phase out troops from their respective borders have been generally welcomed by all political parties and people from different walks of life, except the Sangh parivar and the serving and retired army top brass. BJP leader Atal Behari Vajpayee, while expressing his misgivings about Chinese intentions, has chosen this moment to urge the government to tone up the country's defences. At the same time, the army generals are pressing the centre to boost military resources. What is the purpose behind this well-orchestrated campaign demanding defence preparedness which is being mounted simultaneously by the BJP and the army?

For all practical purposes, the Line of Actual Control has been accepted as a *fait accompli* over all these years by both India and China. No one in his senses would ever think of engaging in a misadventure to recover the territory 'lost' to China in 1962. Leaders of the Indian socialist parties, as well as those from the non-BJP Right (the erstwhile Swatantra Party for example), who were the most vociferous immediately after 1962, in demanding a fight to the finish to win back that territory, have veered round to acceptance of the reality and are seldom heard swearing by that famous resolution adopted by the Indian parliament which vowed to recover that piece of land where no leaf of grass grew. Perhaps, reason has dawned upon these politicians at last. Instead of resurrecting the ghost of a misadventure, they should turn their attention to all the far more important unredeemed vows that the Indian parliament had taken in the past – to remove hunger, to provide potable water and homes to the poor, to eradicate illiteracy – which surely deserve more urgent attention than the perceived military threat from China (an issue which for the last few decades had become an abstruse topic for academic debates among defence experts, army generals, newspaper editors and politicians). Why are the army generals and certain sections of Indian politicians keen on turning this into a live issue?

For the Indian army, it is a matter of redeeming its macho image lost in the Sino-Indian war in 1962. Since it cannot take on China's superior military might, the only avenue left for it is to engage in low-intensity warfare with Pakistan, its militarily inferior neighbour. This suits the Pakistani army also – so that it can continue to claim larger and larger defence outlays – all in the name

of defending Pakistan against India. The increasing defence budget in Pakistan takes care of the perks of the pampered army top brass, as well as the endless race to acquire armaments from the west that satisfies the bloated egos of the army chiefs there – and swells the coffers of the military-industrial complex of the west which sells them the armaments (which need to be replaced or upgraded every year or so, thus leading to more expensive purchases).

The Indian counterparts of the Pakistani army generals have started behaving in the same way. At a seminar in Delhi on national security, held to synchronise with Jiang Zemin's visit, the Indian army chief, General Shankar Roy Chowdhury, made a scathing attack on the Indian government for "a decade of inadequate defence planning and finances" and then went on to justify the demand for a continuing expansion of defence expenditure by coming up with this curious thesis. "Accidents of geography have located India in an unquiet neighbourhood... we are daily faced with warfare ranging from low technology and low intensity to high technology and high intensity..." The image that is being built up is that of an India that is permanently besieged because of 'accidents of geography' – a thesis that rules out political possibilities (like the recent Sino-Indian agreement on troops reduction) that can be made to prevail over 'geographical accidents'.

Significantly, soon after this seminar which was held on November 28, defence minister Mulayam Singh Yadav, announced at the National Defence Academy at Khadakwasla, near Pune, on November 30, that the defence budget would be revised so that more money was available to the armed forces and the Russian-made 'Sukhoi-30 MK multi-role aircraft' – the latest darling of the Indian Air Force – would arrive at their doorsteps, along with Russian submarines, self-propelled guns and other defence hardware. Judging by the way the defence ministry is giving way to pressures from the army generals, we may not be too far away from a Pakistan-like situation with the army virtually pulling the strings from behind a civilian government.

CONGRESS PARTY

Towards a Show-Down

THE results of elections to the Congress Parliamentary Party (CPP) executive bring out the growing marginalisation of Narasimha Rao in the party. Out of 16 seats for which elections were held, 10 are believed to have gone in favour of the anti-Rao lobby. These results, coming in wake of a series of steps taken by the new Congress president, Sitaram Kesri, to whittle down Rao's hold over the party structure, are sure to intensify the pressure on Rao to quit the CPP leadership.

Over the past month, Kesri has been busy reorganising the party so as to pave the way for his election as the Congress president in March next year. To achieve his goal, Kesri has resorted to a three-pronged strategy. First, he has reinducted all those leaders who were forced out of the party for challenging Rao's leadership. Prominent among them are Madhavrao Scindia, Kamalnath, K Bangarappa and Congress(T) leaders whose re-entry will add to the tally of the party's MPs. Secondly, Kesri has been dislodging party office-bearers who are believed to be loyal to Rao. In a span of three days, Kesri axed the Youth Congress chief Maninderjit Singh Bitta, and three AICC general secretaries, B P Maurya, Janardhan Poojary and Devendra Dwivedi. Besides filling up these vacancies with his men, Kesri has been watchful to not eject office-holders like Pranab Mukherjee, Sudhakarrao Naik, Jeetendra Prasada and Vithalrao Gadgil who have shown themselves to be pliant and capable of changing sides. Lastly, as a step to revamp the party image after it has taken a serious beating when many of its top leaders were found to be implicated in various questionable financial dealings, Kesri nominated the former 'untainted' finance minister, Manmohan Singh, to the Congress Working Committee. More recently, he has expelled Sukhram. Moreover, Kesri is known to have plans to change the heads of four frontal organisations and nine party cells and Pradesh and district committees. Already he has removed Ambika Soni and appointed Santokh Singh Randhawa as the PCC chief for Punjab.

Despite this massive restructuring aimed at isolating Rao, it is doubtful that Rao will submit easily. If Rao's tenacity in holding on to his position as party president is anything to go by, removing him from the leadership of the Congress Parliamentary Party (CPP) is not going to be a cakewalk. It may be recalled that Rao ultimately decided to step down from the party presidentship only when the legal cases implicating him in shady transactions started piling up. Now that he has received bail in all the three cases in which he stood accused, he is not ready to forgo his CPP leadership without, as required by the party rules, a two-thirds majority voting against him. Kesri chose instead to enter into a last-minute compromise with Rao over the election of the CPP office-bearers, and thus allowing Rao some breathing space. Further, Rao claims to have the solid backing of MPs from Andhra Pradesh, Orissa and the north-east who together form the bulk of the Congress MPs. It was not for nothing that Rao, immediately on being granted bail, made a tour of Andhra Pradesh and Orissa before the beginning of the winter session of parliament. The Congress may have rapidly shed its skin under the presidentship of Kesri, but it will need a showdown before it disposes of the burden of Rao.

Dangerous Trends

OBSCURANTIST and oppressive religious enclaves are emerging in parts of India which can rival those spots in the Islamic world where obnoxious religious practices are imposed by the clergy. If in Afghanistan, the ruling Taliban stones to death any woman suspected of adultery, in Rajasthan devotees of Rani Sati would have widows mount the funeral pyres of their husbands to prove their chastity and in West Bengal Santhal tribals lynch their women on suspicion of witchcraft.

What is worse in India is that a supposedly secular state, which is committed to modernisation, acquiesces in the revival of barbaric customs in the name of religion, to which sometimes even the judiciary seems to lend legitimacy. In the case of the latest 'Chandi Mahayagna' near the Rani Sati temple at Jhunjhunu, which culminates on the day of the 400th anniversary of Sati, the Jaipur High Court is reported to have given its permission – on the basis of the local administration's plea that the 'yagna' has nothing to do with Sati. Yet it is well known that before the start of the 'hawan' every morning of the 'yagna', prayers are offered to invoke the spirit of Sati. Such a practice clearly falls under the purview of the Commission of Sati (Prevention) Act of 1987, under which any act of glorification of the Sati figure invites imprisonment. In fact, the Rani Sati temple itself, which attracts many local devotees all through the year, is a living temple that continues to encourage faith in a murderous custom (unlike ancient religious monuments, which retain only historical associations but do not perpetuate any barbarity that might have been associated with their original construction).

In this context, one cannot but compare the fate of the Babri masjid with that of the Rani Sati temple. Even if one agrees with the Sangh parivar that the former was built on the debris of a Rama temple destroyed by the Moghuls, one has to concede that the Babri masjid all these years remained a passive and non-violent witness to history. Unlike the politically volatile mosques in Kashmir or the Golden Temple in Amritsar, which became platforms for the fanatic clergy and their political patrons for preaching the message of xenophobia, the Babri masjid was an innocuous remnant of a turbulent past. Yet the Indian state allowed the votaries of Hindutva to destroy this monument in order to enable them to enjoy the petty and vicarious satisfaction of historical revenge, which spilled over into the worst communal riots in India since 1946-47.

Unlike the Babri masjid, the Rani Sati temple at Jhunjhunu continues to preach values that are abhorrent to the principles of the Indian Constitution. Although it might claim to be a monument to the heroism of a Rajput widow who chose to sacrifice herself

to escape her capture by the victors in a war at a certain juncture in Indian history, her memory cannot surely be invoked for a replication of similar self-immolation of widows in India today. If such values and practices from the past are being revived today, certainly there are extra-religious motives involved – on the part of the nexus that has grown even in interior villages of local political careerists, businessmen and religious charlatans. After the immolation of Roop Kanwar in 1987, Deorala has become a pilgrimage where such a nexus is thriving on the gullibility of devotees. Incidentally, the organisers of the 'Chandi Mahayagna' at Jhunjhunu are celebrating the 400th anniversary of Sati with such fanfare because of the shot in the arm they received sometime back following the acquittal of the 39 accused in the Deorala sati case by a district and session judge.

Such judicial permissiveness emboldens the religious revivalists, and encourages their criminal agents to indulge in communal killings. While one agrees with the basic argument that mere laws cannot eradicate inhuman religious practices and beliefs that are deeply entrenched in the popular psyche and that widespread education – particularly of women – is needed to combat such superstitious acts and ideas, one must also assert that strict implementation of the laws that ban such practices is a necessary and effective deterrent. It was the will to firmly carry out the anti-suttee law of 1829 and punish anyone violating it that intimidated the orthodox brahmins of 19th century Bengal and led to the final extinction of the custom in that part of India.

BIOLOGICAL WEAPONS

Verification Hurdle

WHILE the issue of nuclear arms has held centre-stage in arms-control politics, there has been a comparative lack of urgency about eliminating or controlling the production and use of chemical and biological weapons – equally destructive and even more gruesome, if that were possible. The Chemical Weapons Convention still needs 65 ratifications to be brought into force. While biological weapons have been banned since 1925 and 133 countries (including India, with certain reservations) have ratified the 1972 Biological and Toxic Weapons Convention, there has been slow progress on evolving a verification protocol. This is the problem that the Fourth Review Conference, being held over the last two weeks in Geneva, is addressing. The verification protocol is urgently needed if the convention is not to fall apart from disuse, for about a dozen countries are suspected to be engaged in biological weapons programmes.

Specific efforts at evolving verification protocols were made when an ad hoc group was set up by the Special Conference held

in Geneva in 1994 to draft proposals to strengthen the convention while taking care to "protect sensitive commercial proprietary information" and "avoid any impact on scientific research, international co-operation and industrial development". In the ad hoc committee's several sessions, issues which have come to the fore are such sensitive ones as the limits of control on work with listed pathogens and toxins production, microbiology, genetic manipulation, aerosol dissemination, etc. Considerable progress has been made through a series of confidence building information exchange conferences and by trial inspections by Britain, Canada and the Netherlands demonstrating the feasibility of such inspections without loss of commercial information, especially in the pharmaceutical industry and vaccine production facilities. An important aspect of the verification measures is investigation of alleged use, including unusual outbreaks of disease. It is not surprising that there has been much quibbling about the fine print. According to the original timetable the ad hoc committee was to have completed its work by the time the Fourth Review meeting took place. As it happens, the committee has not been able to arrive at a protocol sufficiently without loopholes which is legally binding and contains a deterrence component.

Meanwhile, in a parallel move, Britain, the US and Russia issued a joint statement on Biological Weapons in 1992 and began a trilateral process to eliminate these weapons. However, according to the *SIPRI Annual Report 1996*, the US still claims that it is not satisfied with the Russians' assurance of having abandoned the programme. It claims that there is need for such an assurance, especially on the sites where legitimate biological activities are 'co-located' with former biological weapons programmes. There were some allegations of the use of biological weapons in 1995, but they could not be verified. Thus there were allegations that the government of Myanmar was using such weapons on the Thai border to suppress the militant Karen ethnic minority, the suspicions having been roused by reports of a disease similar to cholera or shigella which could have been brought on by biological weapons. The allegations could not be proved, however.

Admittedly verification and monitoring in the case of biological weapons is far more difficult and complex than in the case of nuclear weapons, especially because it is much harder to distinguish between legitimate biological enterprise and a weapons programme. And with the rapid growth of sophisticated biological and genetic research programmes, such verification is likely to get more complicated. Nevertheless, without an acceptable protocol for monitoring and verification, the Biological and Toxic Weapons Convention remains just a piece of paper.

CURRENT STATISTICS

EPW RESEARCH FOUNDATION

The banking and monetary situation is showing growing signs of excess liquidity. While M₁ growth is accelerating, the expansion of domestic credit, particularly credit to the commercial sector, has been unduly slow. Both the increase in net RBI credit to the centre and the use of ad hoc have remained at low levels for sometime. Official acquisition of foreign assets of over Rs 10,000 crore since March has contributed to the monetary expansion. A situation where increase in banks' aggregate deposits of Rs 31,105 crore has been accompanied by increase in bank credit of less than one-tenth of that amount is unprecedented

MUKAND

New Steel Plant

MUKAND, the country's leading mini steel unit, improved its performance in 1995-96. The company produces iron and steel products such as wire rods, bars, rods and sections and bright bars; steel castings including alloy steel castings; and industrial machinery including spares, assemblies and component parts. The Bajajs and Shahs together hold 32 per cent of the company's equity and another 32 per cent is held by financial institutions. While net sales increased by 22.2 per cent over the previous year, value of production improved by 24.4 per cent. The company produced 2,16,261 tonnes and sold 2,12,214 tonnes of iron and steel products in 1995-96 compared to a production of 2,00,191 tonnes and sale of 1,95,352 tonnes in the previous year, representing increases of 8 per cent and 8.6 per cent, respectively. The higher offtake was mainly due to the higher demand for steel from automobile and engineering units in the country. A lower increase in operating expenses led to a rise of 44.1 per cent in operating profit. However, increased interest cost (up 27.7 per cent), higher depreciation charges (up 25.3 per cent) and the tax provision of Rs 10 crore (1994-95: nil) led to a lower 15 per cent rise in net profit. Consequently, the company did not increase the dividend from last year's 35 per cent.

Though the company's exports increased by 89.9 per cent, it remained a net importer with imports rising by 14.8 per cent over the same period.

The company has decided to have a strategic alliance with Kalyani Ferrous Industries (which is setting up mini blast furnaces at Hospet in Karnataka) as production of steel through the electric arc furnace route is becoming uncompetitive following the continuous increase in cost of scrap and electricity. Mukand, after installing facilities for converting hot metal into steel, plans to buy hot metal from Kirloskar Ferrous Industries and convert it into steel billets and blooms, a part of which will be sold to Kalyani Steel.

The company is also setting up a 5 mn metric tonne (mmt) steel plant at a total cost of Rs 12,000 crore over a five-year period. The project, which is being set up as a separate company christened Mukand Vijaynagar Steel (MVSL), will be completed in three phases, the first of which will have a capacity of 1.75 mmt and involve an investment of Rs 5,000 crore. The first phase is expected to be completed in 36 months. Kawasaki Steel Corporation, a world major in steel, is likely to pick up a 20 per cent equity stake in the project and also supply the blast furnace technology. The new company plans to tap the capital market sometime in 1998.

For the first five months of 1996-97 the company has reported a 6.8 per cent fall in turnover to Rs 363.3 crore from 390 crore in the corresponding period last year mainly due to the slump in global demand for stainless steel products. The cut in import duties coupled with a drop in global steel prices also made imports cheaper. However, the increase in custom duties on stainless steel billets from 20 to 30 per cent in the 1996-97 Finance Bill is expected provide some relief in the future.

The company had made a private placement of equity. To neutralise the equity dilution from the private placement, the company issued 22.59 lakh warrants to the promoters which were to be converted into fully paid-up shares of Rs 10 each at a premium of Rs 233.5 per share by August 25, 1996. Though the promoters exercised the option of converting the warrants in 1995-96, and were accordingly allotted partly paid-up shares, they have now asked for more time for paying the balance amount for converting the partly paid-up shares into fully paid-up shares. The company's share price, in the meanwhile, has fallen steeply over the last six months to touch Rs 64.75, a huge decline over the allotment price of Rs 243.5 per share.

SIEMENS

Telecom Misadventure

Siemens saw only a marginal improvement in its performance during 1995-96 with its huge investments in the telecommunication and power sectors affecting its liquidity position. The company's main products include switchgear, electric motors/generators, switchboards, control boards and miscellaneous accessories, variable speed AC/DC drive systems, motor control modules, programmable control systems and digital electronic switching systems.

Though net sales and value of production improved by 34.7 per cent over 1994-95, the company's bottomline suffered due to the high cost of finance. Though operating profit jumped 52.3 per cent over the previous year, interest charges shot up by more than 160 per cent, depreciation charges rose by 56.3 per cent and tax provision was higher by 17.1 per cent over the same period. Consequently, net profit increased by a marginal 6 per cent and the company thought it prudent to cut the dividend from last year's 55 per cent to 45 per cent. The company claims that the main reasons for its changed dividend policy and the higher interest costs were the tight liquidity crunch, its considerable investments in the telecommunication and power segments clearly affected its performance in 1995-96. The lack of orders for products such as EWSD switching systems and fibre optic

cables has led to the company's Calcutta facility remaining almost completely idle throughout the year. Also, the company (a net importer) saw a sharp increase in imports of 154.4 per cent in 1995-96 while its exports fell by 37.4. A sharp increase in borrowings led to a jump in the percentage of debt to equity from 39.4 per cent last year to 94.4 per cent.

Siemens, meanwhile, has become the first Indian company to dematerialise its scrips following a tripartite agreement with its registrar and the National Securities Depository (NSDL) on October 29. This will now enable the company's shareholders to hold shares in the electronic form at the NSDL, thus avoiding physical delivery of scrips and entailing immediate transfer of shares.

Due to its poor performance in 1995-96, the company is now planning to hive off its telecom operations to a new, majority-owned company of its parent, Siemens AG. This will enable it to transfer its losses to the German company (which has the capacity to absorb such losses) and will also result in improving the bottomline of the Indian company. Also, with hardly any signs of the liquidity position improving, the company's performance in 1996-97 is also not expected to be any better although the second half could see a slight improvement in the liquidity situation.

With the company's earnings per share rising from Rs 12.4 last year to Rs 13.1, the company's share price rules at Rs 343 at the bourses, discounting its 1995-96 earnings 26.2 times.

ARVIND MILLS

Expansion Plans

This Arvind Lalbhai group company saw a mixed performance in 1995-96 with the first half of the year seeing an unprecedented rise in the price of cotton (its main raw material) and the second half showing a relatively more favourable downward trend in prices. While net sales for the year improved by 24.8 per cent over the previous year, 1994-95, the value of production rose by a lower 15.5 per cent over the same period as production was only marginally higher. The company is the largest manufacturer of denim-wear in the country.

The company's main revenue comes from its textile division (up to 92.4 per cent) while the balance is drawn from the garment division and electronics and medicines. The company produced 762.2 lakh metres of cloth and 43.6 lakh kgs of yarn during the year compared to 751.9 lakh metres of cloth and 43.7 lakh kgs of yarn in the previous year. Production of garments (converted on job work basis by outsiders) also saw a sharp increase from 3,17,035 nos to 11,98,716 nos

(up 278 per cent). Sale of cloth and yarn, in volume terms, was higher by 7.2 per cent and 3.7 per cent at 788.2 lakh metres and 44 lakh kgs, respectively.

With the sharp rise in cotton prices, the company undertook certain measures to protect the bottomline and improve profitability through sustainable means. This included a review and rationalisation of the product mix under which it discontinued certain products yielding lower contribution and also upgraded its product portfolio by adding value added and differentiated products. Further, extensive use of value engineering in choosing raw material ensured cost reduction without compromising on fabric quality and manufacturing productivity.

While manufacturing expenses increased by 18.5 per cent during the year, remuneration to employees fell by over 11 per cent mainly due to the major cost cutting exercise which included voluntary retirement schemes at both the worker and management levels. This led to a sharp cut of 37 per cent in the total number of employees from 8,604 to 5,340, reducing employee cost from 8.4 per cent of sales in the previous year to 5.9 per cent. Consequently, operating profit rose by 35.2 per cent during the year. There was a sharp increase of 54.2 per cent in interest costs, despite a fall of 15.3 per cent in total loans. A lower rise of 14 per cent in depreciation charges and nil taxation (1994-95: nil) helped the company post a 25.6 per cent rise in net profit. Encouraged by its performance, the company raised the dividend rate from 41 per cent last year to 45 per cent.

While exports improved by 60.4 per cent, imports fell significantly by 76.3 per cent. With a major part of the company's income coming from exports, it has set up a foreign exchange division to enable scientific management of foreign exchange risk.

The company, meanwhile, raised a term loan of \$ 15 mn from a syndicate of overseas banks during the year and plans to tap the comparatively cheaper overseas debt market. Arvind Mills has drawn up major investment plans to be implemented over the next two years (at an estimated cost of Rs 850 crore) involving expansion of the denim fabric capacity by 40 mn metres per annum; establishing a world class facility to manufacture 3,600 tonnes per annum knitted fabrics in technical collaboration with 'Alamac', a division of West Point Stevens, USA; expanding the high value cotton shirtings facility to 20 mn metres per annum; setting up captive power generation facilities to meet the entire requirements of power for the existing and the proposed new facilities; and expansion of the jeans and casual gaberdine trousers capacity to 4 mn pieces per annum.

The company's share price currently quotes at around Rs 119 on the bourses, discounting the 1995-96 earnings per share by 10.4 times.

High Cost of Financial Sector Reform

The slow-down in industrial activity is now increasingly getting reflected in the portfolio behaviour of banks and financial institutions. Banks' initial reluctance to lend has been reinforced now by companies' unwillingness to borrow both because of the low level of industrial activity and the persistence of high interest rates. All aspects of financial sector liberalisation, however, preclude any significant lowering of interest rates by banks and financial institutions, even as company finance studies clearly show how mounting interest costs are having a severe impact on corporate results.

I Recession Reinforcing Excess Liquidity

ALL indicators of industrial activity – output trends, sales of corporate bodies and their profitability, growth of export-import trade and inventories of finished products – point to distinct signs of a slow-down. This in turn is now increasingly getting reflected in the portfolio behaviour of banks and financial institutions, particularly in the form of nursing excess short-term liquidity. Interestingly, the large CRR releases and the consequential increase in liquidity are only concentrated among banks without their spread effects seen in the activities of mutual funds, non-banking financial companies (NBFCs) and the primary segments of the capital market, all of which are indicative of sluggish real economic activity and inadequate financial savings. Banks have acquired sizeable deposit resources but credit growth continues to be depressed. Banks' initial reluctance to lend has now been reinforced by the corporates' unwillingness to borrow both due to low industrial activity and persistence of high rates of interest. The recent Supreme Court judgment requiring bank officials to stay within their lending limits, the RBI's circular advising bank officials to be careful in using their discretionary powers and constraints like strict adherence to capital adequacy norms have all imposed restraints on commercial lending by public sector banks to begin with. With the surfeit of liquidity, banks are being pressurised to lend but there appear to be fewer takers of credit at the prevailing high rates of interest.

All aspects of financial sector liberalisation including high cost of funds, stiff competition and the swearing by the bottomline, are preventing banks from making any significant downward adjustment in interest rates. Although the prime lending rates of banks and financial institutions have been brought down in response to the authorities' professed desire, the average lending rates

for the majority of the industrial borrowers continue to be pegged at high rates. It is now known that though the SBI was the first to cut the PLR from 15.5 per cent to 14.5 per cent, such benefit was limited to only a few government-guaranteed accounts. For other top rated companies, the PLR still remains at 15.5 per cent. SBI has also kept its maximum lending rate unchanged at 18.25 per cent which applies to almost 50 per cent of its borrowal accounts. Though the FIs had reduced their maximum lending rates by one percentage point to 20 per cent, their modal rates remain high and they are also sceptical about any downward movement of long-term rates in the immediate future. IDBI still continues to borrow at 16 per cent for one-year funds and 16.5 per cent for three years. With the drying up of low-cost funds from SLR bonds and also central banking assistance, the term-financing institutions are vying with one another, to mobilise funds at a high cost in an environment where domestic financial savings are not growing. As the demand for funds particularly for infrastructure projects is likely to increase substantially in the future, the long-term rates of interest are likely to remain at high levels. The high interest rate environment is already having a serious impact on corporate results. Studies on company finances reveal sharp jump in their interest cost by about 30 per cent in 1995-96 and again by about 33 per cent as per the half-yearly results of 1996-97.

In such a situation banks continue to harbour excess liquidity. Between March 31 and November 22, 1996, aggregate deposits of scheduled commercial banks expanded by Rs 28,696 crore (or by 6.6 per cent) against the increase of only Rs 13,386 crore (3.5 per cent) in the corresponding period of 1995-96. No doubt the deposit growth appears strong essentially in relation to last year's meagre growth and also in relation to the sluggish credit demand, as otherwise the actual growth in the current year is unlikely to exceed the working estimate of

bank deposits at Rs 68,000 crore (16 per cent). The Reserve Bank had initially expected a bank credit expansion of Rs 50,800 crore or 20 per cent during the whole of 1996-97. On the other hand, the actual increase so far has been a paltry Rs 1,599 crore or 0.6 per cent against an expansion of Rs 18,014 crore of 8.5 per cent during the comparable period of the previous year. Commercial banks do not have the wherewithal to deploy funds for long-term assistance to industries which is the need of the hour. Instead, banks have expanded their investment in government securities (Rs 16,530 crore) and repaid their borrowings from RBI (Rs 14,000 crore).

SLUGGISH GROWTH OF DOMESTIC DEBT MARKET

The phenomenal expansion in liquidity as a result of capital inflows from abroad in 1993-94 and 1994-95 had given a boost to the equity as well as the domestic debt market. The stock of marketable debt had suddenly jumped to over Rs 3,00,000 crore or a little more than one-third of GDP at current market prices by the end of March 1994 (Table 1). Thereafter, the corporate equity market suffered a setback but the debt market gained some momentum particularly because of the offer of disproportionately high real rates of interest on them. As a result, the total stock of marketable debt increased to about Rs 3,91,000 crore by the end of March 1996, i.e., by about 29 per cent in two years. It may have touched about Rs 4,12,000 crore by now partly because of large government debt and partly due to private placements of PSU and other bonds in the absence of a vibrant primary market. This is of course certainly not a high rate of growth in debt instruments, and combined with the fact that primary issues of corporate equities and resource mobilisation by mutual funds and NBFCs have suffered a setback (not all of course additive), the above suggests that the growth of financial assets in the economy has been niggardly. This is one reason why, in a competitive environment, the interest rates on debt instruments have remained generally high (Table 1). Also, as the data presented in the subsequent parts of the note suggest, the secondary market turnover in debt instruments has risen rather sizeably over the recent period due to the availability of large short-term liquidity.

* II Fund Flows, Call Money and Exchange Markets

Though the overnight money rates displayed greater volatility during November, the underlying situation has been

one of easy liquidity. The increase in the coefficient of variation from 15.2 per cent in October to 61.6 per cent in November (Table 2) in fact exaggerated the range of variations, for the call rates only crossed the psychological barrier of the export refinance

rate of 11 per cent for the first time since the end of June (Graph A). Only a year ago the rates had once skyrocketed to a range as high as 60-130 per cent (Table 3).

When the call rates ruled abysmally low at 1-2 per cent during the first week during

November following relatively larger inflows of funds into the system, the RBI surprised the market with a 4-day repo auction, absorbed Rs 932 crore on November 5, and helped the call rate to move up to 11 per cent on November 7; there was also an

absorption of Rs 682 crore as subscription to 364-day treasury bill (TE) on November 6. With the release of repo auction money on November 9 and also 0.5 per cent instalment of CRR (Rs 2,140) crore, the beginning of the fortnight saw call rates opening at 5 per cent but soon the rates firmed up and ruled in the higher range of 10.5-12.0 per cent until November 21 mainly due to a sizeable withdrawal of bank deposits for the Diwali festival (there was an absolute fall of Rs 980 crore in demand deposits between November 8 and 22) and the RBI's second repo auction which nevertheless evoked poor response at Rs 300 crore. This period saw banks taking recourse to export refinance to an extent. On November 21, the penultimate day of the reporting Friday, call rates opened at 10.25 per cent but again crashed to 3.0 per cent in the afternoon when FIs rushed in to lend and the banks had already completed their CRR obligation.

The last week of November witnessed call rates softening as the system saw sizeable inflows of funds (Table 4). The return of Rs 300 crore from the RBI repo on November 23, the recycling of the earlier Diwali cash withdrawals, coupon payments estimated Rs 1,140 crore and the expected cash injection on account of 6.25 per cent 1996 stock on December 1. Though the call rate opened at 10 per cent on November 26, it soon nosedived to a range of 1.5 to 3.0 per cent during the subsequent four days.

FOREIGN EXCHANGE MARKET

The rupee rate in the domestic forex market depreciated somewhat until mid-November but recovered some lost ground by the month end. The RBI reference rate which opened

at Rs 35.67 a US dollar steadily rose to 35.82 on November 15, but ruled between Rs 35.69/76 thereafter. The forex activities were guided mostly by continual intervention by the RBI which mopped up nearly \$1 billion of cash dollars to liquidate that much of rolled-over forward contracts maturing in December and January. The pressure was added by the reduced FII net inflows of only Rs 310 crore as against Rs 839 crore in October. Apart from some repayments of FCNRA deposits falling due, November-December months were also expected to act as a build-up for the larger repayments in January-February when India Development Bonds mature. The authorities probably perceive that the rupee stood overvalued to the extent of about 7 per cent in REER terms vis-a-vis its level in March 1993 and that hence there was some scope for fall in its value. As a result of the relative stability in the exchange rate, the importers generally preferred to remain uncovered resulting also in lack of demand for dollars. The forward premia which experienced a rise during the first three weeks of the month generally fell in the last week

GRAPH B: SPOT QUOTATIONS FOR THE US DOLLAR IN THE DOMESTIC INTER-BANK MARKET

(Graph B) when the call rates dipped to low levels. The six-month forward premium which steadily rose from about 6.16 per cent in the first week to 9.10 per cent in the third week fell to 8.40 per cent in the last week of the month (see EPW, December 7).

III

Primary Market in Gilt-Edged and Other Debt Instruments

DATED SECURITIES

The lone auction of a medium-term government of India loan on November 26 received 145 bids for Rs 2,327 crore as against a notified amount of Rs 2,000 crore. The vigorous persuasion done by the RBI and the release of liquidity through the reversal of repo funds and tap bill liquidation brought in not only a minimum devolvement on the RBI (Rs 417.85 crore) and the PDs (Rs 48.50 crore) but also the cut-off yield was brought down by 20 basis points. It collected Rs 1,533.65 crore at 13.55 per cent for the five-year loan. Earlier, in May the

RBI had given 13.75 per cent for a 5-year paper. With the collection of this Rs 2,000 crore, the government completed over 90 per cent of its budgeted gross borrowings for Rs 33,400 crore for 1996-97. It is expected that with a large supplementary grant proposed for the central budget and the expected shortfall in revenues including the failure to achieve the PSU disinvestment of Rs 5,000 crore, the government may come to the market for borrowing beyond the budgeted amount. Also, since the net RBI credit to the central government is well below the expected levels (Rs 8,719 against Rs 18,496 crore last year) and so are the borrowings through the *ad hoc* TBs (Rs 6,495 crore against Rs 12,100 crore), it is likely that the government may raise the additional funds through private placement with the RBI towards the close of the financial year. It may be recalled that the government had similarly placed Rs 5,000 crore worth of securities with the RBI in March 1995.

91-Day Treasury Bills

The 91-day TB auctions of November produced certain peculiar results. First, the RBI showed its anxiety to bring down the discount rate so much so it even rejected all bids in one auction and accepted only Rs 2 crore in another. Even so the yield rate edged up somewhat. Secondly, despite a generally liquid situation, sizeable subscriptions devolved on the RBI and the PDs. Initially, the slide in the yield on 91-day TBs continued in November when in the auction held on November 1, it went down sharply from the earlier 8.83 per cent to 6.79 per cent. In the auction of November 8, the impact of 14-day repo auction conducted by the RBI was felt and the yield firmed up to 7.23 per cent. It remained at this level in the next auction and then further firmed up in the November 22 auction. The level of yields on 91-day TBs as at November end was 8.19 per cent. The response in terms of number of bids and, amounts received was revealing. For the Rs 500 crore auction in November there were 89 bids for an amount of Rs 2,015.25 crore. For the subsequent notified amount of Rs 2,000 crore in four auctions, the bid amount was only Rs 981.58 crore (Table 5). In the second auction, while the number of bids received was 23, the

amount received was one-fourth the amount received in the first auction. This could be because a large amount of funds was first locked up in tap bills and then in repo auction. In the auction of November 15, there were only 12 competitive bids for Rs 137.85 crore and the RBI rejected all of them accepting only one competitive bid for Rs 50 crore. The response came back to normal only in the auction of November 29 when out of 35 bids for Rs 596.40 crore, the RBI accepted 33 bids for an amount of Rs 500 crore at a discount rate of 8.16 per cent.

364-Day Treasury Bills

Taking advantage of easy liquidity in the earlier part of the month, the RBI attempted to realign the yields in the money markets. With low call rates and a comparatively high cut-off yield of 12.10 per cent offered in the October 25 auction of 364-day TBs, the investors' expectation of continuation of such high rates resulted in an overwhelming response bids towards the November 8 auction with 63 bids for Rs 1,590.55 crore. Taking advantage of this, RBI selected only Rs 682.8 crore from 14 bidders and drastically reduced the cut-off yield by 200 basis points to 10.10 per cent. However, such manoeuvrability was lost when the next auction on November 20 invited a meagre bid amount of Rs 197 crore out of which

the RBI only Rs 55 crore and that too by paying a slightly higher cut-off yield of 10.40 per cent (Table 6).

Bonds Market

The bonds market was dominated by two issues, the one floated by the Maharashtra Krishna Valley Development Bonds (Rs 250 crore) and the other by the Konkan Railway Corporation (Rs 150 crore). The MKVDC issue had a greenshoe option of Rs 50 crore with an effective return of 18.55 per cent on regular bond and 18.46 to 18.53 per cent on deep discount bonds (DDBs) of 7-year maturity. The retail investors, however, surprisingly remained apathetic towards both the issues. Yet another development was the innovative Dutch auction introduced in the Indian market for the first time by the ICICI with a private placement of Rs 200 crore. (Under Dutch auction all bids received at maturity value higher than the cut-off value are rejected and all successful bidders get the maximum yield). The yield offered at 14.5 per cent for the 15-month regular instrument was significantly lower than the 16.15 per cent yield for the similar maturity paper issued in August. The IDBI's 'on tap' issue of one-year bond at 14 per cent as against 16 per cent earlier and the five-year bond at 15 per cent as against 17 per cent,

GRAPH D: YIELD CURVES FOR 364-DAY TREASURY BILLS AND DATED SECURITIES - WEIGHTED AVERAGE FOR NOVEMBER 1996

also reflected the downward movement in yield. However, all these issues did not receive favourable response due to lower yield.

Besides, six other PSUs entered the market for their private placements. The issues by Rajasthan SEB at 19.0 per cent and Punjab SEB at 17.16 per cent were extended due to poor investors' response. Similarly, the private placement issue by TFCL at 16.8 per cent was extended as it failed to garner the target amount in the scheduled open

period. While NPC barely managed to achieve its targeted amount of Rs 100 crore, the lone tax-free issue of Rs 150 crore by KRC with an effective post-tax yield of 11.67 per cent appears to be sailing smoothly. The bond issue of KBJNL was also successful due to high effective yield of 19.7 per cent.

One of the important reasons for some success of most issues by FIs and PSUs is that such debt instruments are eligible for

permitted investments for various trusts, PFs, pension funds, banks, insurance companies, etc. Secondly, the FIs adopt a practice of indirect self-financing of their issues. These FIs lend money to their corporate clients as loans prior to the issue with the sole condition of investing in their issues. Though these issues become successful in the primary market, the secondary market remains adversely affected as the prices fell immediately after the issues because the corporates

Figures in parentheses in cols 3 to 6 represent numbers and amounts of non-competitive bids which are not included in the total.

Figures in the square brackets under cols 8 and 9 represent weighted average price and respective yield.

* Development on primary dealers, exclusive of RBI. @ Outstanding amounts are estimated for last few weeks of November 1996.

who are arm-twisted earlier start selling them to recover their cash.

The private sector market has finally seen visitation of bonds similar to junk bonds. For example, the NCD of JB Lab which received a credit rating of LA(P) by ICRA implying adequate safety is now offered at large discount of 42 per cent yield. Even the yield of Alkyl Almines NCDs went up to 129 per cent. The market is flooded with many such issues.

The private sector debt market recorded sizeable fall in private placements of debenture mainly due to (i) increased competition from NBFCs who still offer very high rates on their fixed deposits, (ii) fear psychosis of defaults, and (iii) saturation of debt issues. With demand coming down, the effective yield on many private companies' NCDs went up to 25 per cent. The overall yield curve in the private debt market has an upward shape up to medium-term and downward in the longer-term.

Commercial Paper

As per the credit policy announcement in October and the subsequent issuance of the guidelines on commercial paper by the Reserve Bank, there was new life in the primary market for the instrument. Nearly 40 companies had obtained credit ratings for CPs. The volumes of fresh issues went up from mere Rs 200 crore in September to Rs 1,500 crore in November. Of these around 25 companies had already issued their CPs during October. Interest rates on the paper had gone down to as low as 11-12 per cent offering an attractive low cost borrowing option to the corporates. Banks were, however, not so co-operative to the corporates in allowing them access to the CP avenue as that meant loss of interest income for the banks. It is necessary for the corporate sector to obtain a no-objection certificate from their bankers before approaching another banker for issuing CP. The RBI in its circular detailing the CP guidelines clarified that banks could not refuse a corporate unit to borrow from another bank through the CP if it had met all the eligibility criteria. This would make life easier for corporates.

Certificates of Deposits (CDs)

Much of the issuance of CDs in November originated from private banks which experienced asset-liability mismatches. For example, UTI Bank issued CDs worth Rs 500 crore and Centurian Bank Rs 100 crore. As a result, the primary CD rates which ruled around 11-12 per cent in the first week of November increased to around 12-13.5 per cent in the third week of the month.

ICD Market

The inter-corporate deposit (ICD) market has been undergoing a turmoil since the past several months. News of defaults in this market has been rampant with lender companies resorting to legal action in many a case. During November, three cases of default and the subsequent legal action came to light. The Leela group filed a criminal complaint against Modiluft for defaulting in the repayment of ICD. Modiluft managing director and vice-president were summoned before the Mumbai magistrate; Modiluft had raised Rs 5 crore through ICD from Leela group's finance company in February. The Mumbai-based Ankit Traders filed a criminal complaint against the Hyderabad-based Transgene Biotek for default of Rs 50 lakh borrowed through ICD; and the public sector Cement Corporation of India also failed to service its obligation for repayment of around Rs 24 crore of ICD. Similarly, Vardhman Spinning and General Mills had to resort to legal course for recovering Rs 1 crore worth

of ICD from Real Value Appliances. Though the criminal complaint filed by lenders related to bouncing of cheques issued by borrower companies towards repayment of ICD, the fact that these companies defaulted for repayment of a small sum was indicative of the difficult financial position of the corporate sector. The lenders became extra cautious with the activities limited to only subsidiary companies. As the ICD market being constantly bedevilled by frequent defaults and rollovers, the ICD rates continued to rule firm around 16-18 per cent for top rated companies and 21-25 per cent for low rated companies.

IV Secondary Market

Dated Securities

Yields in the secondary market moved in tandem with the call rates. The high activity in the government securities market witnessed during October and early part of November tapered off in mid-November as

the overnight rates firmed up. The activity once again picked up in the last fortnight of the month as calls eased to sub-normal levels of 2-3 per cent. The interest was largely in short-term papers such as TBs and short maturity securities in the initial part of the month as there was uncertainty regarding call rates. As per the RBI's SGL transactions, the largest transaction worth Rs 1,196 crore took place during November in the 13.50 per cent 1997 paper. The interest in short-dated paper brought about a fall in the yields on these papers. Yields at the very short end – less than 14 days – came down by 200 basis points whereas those on papers with less than 360 days maturity fell by 50 basis points. As prices of securities fell with the rising demand in the second half of the month, the yields once again firmed up across the maturity spectrum although short-dated maturity paper showed a sharper rise. Prices of 13.50 per cent 1997 and 13.62 per cent 1998 papers shed 120 paise and 85 paise, respectively, in one fortnight. The zero coupon bond maturing in 2000 also shed 80 paise (Appendix Table).

OMO and Repo Auctions

After a long period, the Reserve Bank initiated an active open market operation (OMO) policy through repo auctions, apart from the usual sale/purchase window. Such active OMO was geared towards sterilising the excessive liquidity injected into the system by way of RBI's intervention in the forex market, and also developing

market reference rates. The repo auction system has been resumed after a gap of 20 months. During the month, RBI transacted liquidity worth of over Rs 2,800 crore from the system which resulted in firming up of secondary market government securities yield rates.

Repo Auction by RBI

The RBI's repo auctions, which provided the banks with an outlet for investing short-term surplus liquid funds and which were suspended on February 3, 1995 after the emergence of stringent liquidity conditions, were resumed during November 1996. While the first 4-day repo attracted substantial bids, the second 14-day repo failed to evolve such a response. On November 4, RBI undertook 4-day repo auction. RBI received 42 bids worth of Rs 1,325 crore, out of which RBI accepted 29 bids worth of Rs 932 crore at 4 per cent. The absorption of such large liquidity out of the system had the neutralising effect on the securities market as reflected in rapidly crashing yield rates. For example, the Zero Coupon Bond 2000 AD lost 12 paise in a single day from Rs 62.88 in the morning to Rs 62.75 in the afternoon.

Similarly, the Reserve Bank introduced 14-day repo auction almost after 30 months on November 9 – a day on which the RBI released Rs 2,130 crore by way of 0.5 percentage cut in CRR. In the said auction, Reserve Bank received 22 bids worth of Rs 725 crore out of which it accepted only one bid for Rs 300 crore at a cut-off yield

of 5.48 per cent (Table 7) as against the market expectation of 7 to 7.5 per cent.

Besides the deployment of repo auctions, RBI also transmitted its policy through periodic changes in its sale and purchase prices of government securities. On this window alone, RBI mopped up liquidity worth of Rs 1,579 crore during the month.

Repo Transactions Outside the RBI

The repo market route for such short and non-DTL attracting duration as three days has become a regular funding mechanism for the banks' overnight needs. Such repos interestingly were undertaken at much somewhat higher yield rates (ranging from 6.3 per cent to 10.9 per cent) than the RBI repo route (Table 8). The non-RBI repos aggregated Rs 3,352 crore during November as compared with Rs 2,914 crore in October.

Yield Rate

Reflecting the easiness in short-term liquidity and overall uncertainty regarding the long-term rates, the yield curves for both dated securities and 364-day treasury bills have generally remained flat (Graph D).

Other Debt Instruments

The secondary transactions in PSU bonds, both taxable and tax-free, have steadily increased in recent months. Likewise, in commercial papers (Table 9).

[V P Prasanth and Refiq L Ansari have rendered considerable help in the preparation of this review.]

GUIDING RESEARCH IN INTERNATIONAL RELATIONS: WORKSHOPS FOUR AND FIVE

With a view to enhance the study of international relations in India, the ASRC and the host universities are organising several Workshops for Research Guides. They are designed to provide an opportunity for those guiding research leading to M.Phil and Ph.D. degrees in the field of international relations (broadly defined) to exchange ideas on research topics, guidance, source materials, writing, etc.), to discuss procedures and regulations for registration, and also to acquaint themselves with recent trends of research and published work in the field. Earlier Workshops were held at Hyderabad, Baroda and Udaipur. The fourth and fifth are to be held in February and May 1997.

Recognised research guides who have guided/registered at least two M.Phil/Ph.D. scholars in international relations under their supervision are eligible. Selected participants are entitled to round trip train fare by first class/AC sleeper, incidental expenses and local hospitality on the campus of the host university.

If interested, please send your latest C.V. along with the titles of the dissertations completed under your guidance, the year(s) of the award of M.Phil/Ph.D. degrees and a list of scholars currently working with you, along with their research topics and registration dates at least one month in advance to the following :-

Minor Forest Produce and Rights of Tribals

Vidhya Das

For the ostensible purpose of protecting the right of the tribals to their livelihood, government policies have in fact been dispossessing the tribals from access to local resources and maintaining their own economy. The struggle waged by Mandibisi Mahila Mandal in Orissa for control over minor forest produce is just one case of tribal assertion against unjust government machinery.

IN 1953, 1,000 tribal women went to meet the then chief minister, Nabakrushna Choudhury to demand that the tamarind tree leases to private parties be withdrawn in the interests of people living in tribal areas. Verbal, the chief minister agreed, but nothing happened in practice. Four decades later history repeated itself, when women went and demanded of Biju Patnaik that they be allowed to collect and sell minor forest produce (MFP) to which the chief minister agreed but then nothing happened. So the struggle for rights over MFP is an old one, and will probably continue for time to come.

The government of India and the state governments have taken up the implementation of numerous anti-poverty programmes in tribal areas. While the objectives of these programmes may be commendable, their actual impact for poverty alleviation and development of marginalised groups is severely undermined by the role of many non-monetary policies which are quite insensitive to the ground realities in tribal areas. The policies of the Orissa government regarding collection, sale and processing of MFP are a case in point. Though these items provide a sizeable revenue to the state, the tribal people who spend long hours to collect it are not allowed to stock, process or sell it in the open market. The government controls these activities through a system of leases and permits which are granted on the whim of political leaders with no clearly defined criteria. Beyond the levy of a fixed amount of royalty there are no terms and conditions either. The lease from the government amounts to a virtual sanction to exploit and loot the people in tribal area with regard to the particular item of forest produce. The lessee with the authority of his lease calls the tune as per the prices, the method of procurement (with quantity measurement units ranging from improvised volume units to weights using rock pieces), as well as the stage of processing required before the primary collector can sell it. All this is

enforced with the able assistance of the forest department. On the other hand, where government corporations like the tribal development co-operative corporation (TDCC) have taken the lease for certain items, the normal practice is to sublet their lease to the local businessmen, who then carry on in their usual exploitative manner.

STRUGGLE OF MANDIBISI MAHILA MANDAL

Confronting this every day, and after having gone for dialogue with the chief minister, the women of Mandibisi G P, Rayagada district took a brave step: they formed the Mandibisi Mahila Mandal and started collecting the MFP item, hill brooms, by buying it from the primary tribal collectors assuring fair price and exact weighing to them. They thus effectively prevented exploitative private traders and crooked sub-agents of the TDCC from operating in the area and cheating the tribal people. They had repeatedly petitioned the district and state administration for permission of collection and sale of the hill brooms.

They took this step with the firm conviction that the government would legalise their collection, ensuring a fair deal to them, unlike the TDCC, whose offer of sub-agentship allowed the Mahila Mandal but a 2 per cent commission, with no margin over the government's fixed procurement price. This incidentally was also the deal with the sub-agents who usually operated in the area, and which gave these agents a free licence to exploit and cheat the tribal people. Admittedly though, under the terms and conditions offered by the TDCC, the traders had few other options, even if they had wanted to be fair to the people.

The government did consider other options in favour of the Mahila Mandal. But it was hampered by the legal constraint of the TDCC having the lease for the hill brooms till the end of a period, hitherto unspecified. Though ostensibly working for the welfare of the

tribals, the TDCC was loath to relax its lease in favour of the Mahila Mandal (whose membership is more than 80 per cent tribal). On the other hand, there is evidence to show that the TDCC permitted the sub-agents to carry on trade at their own terms and conditions. After numerous meetings and discussions, the department of panchayati raj government of Orissa issued a letter to the Mahila Mandal that the TDCC shall appoint the registered DWCRAs groups as additional agents in their locality and grant licences to them for collection and marketing of finished MFP items through Orissa Rural Marketing Apex Society (ORMAS) which was ready to buy the Mahila Mandal's stock at Rs 7 per kg. The letter further invited the concerned groups to become members of the DSMS, the district branch of ORMAS. This appeared to be a positive action on the part of the state. The Mahila Mandal members responded by taking a loan for training of hill broom binding so that they could sell to ORMAS.

But they were shocked when on May 28, 1995, the stock of brooms collected by the Mahila Mandal was forcibly taken away by the forest department in the presence of official representatives of the TDCC. Several months passed by. Numerous officials made enquiries into the case. The Mahila Mandal members were told that they would have to accept payment for 70 quintals of broom stock when more than double the quantity (174 qtls) had been collected. Even if the weight loss due to drying, wastage on storing, etc, is taken into account, the eventual weight would reduce by 20-30 per cent at the most. Why were the departments and TDCC indulging in cheating? What happened to the brooms taken away?

On August 19, 1995 the revenue divisional commissioner (RDC), southern division came for an enquiry. The forest department officials and the Kashipur branch manager of the TDCC stuck to their statement of 70 qtls. and claimed the Mahila Mandal members wrong. On this point of contention it was decided that brooms would be returned to the store from where they had been removed, as the exact quantity of stock could not be determined. A deadline of August 31 was given, but went unheeded. After a long wait, the conservator, Koraput, took up the case. In January 1996, he personally went to Mandibisi and gave an assurance to the members of the Mahila Mandal that their stock would be returned as per the decision of August 19. Two truckloads of brooms were off-loaded in the storehouse. The store was only partially filled. The members refused to receive the brooms till the stock was returned as per the decision taken during

the meeting with the RDC. The forest department locked the storehouse.

The women went for a public interest litigation to the Orissa High Court. The court, too, chose not to consider rights of tribal people, and referred the matter to the secretary of the department of forests "to dispose of the application of the petitioner in accordance with the provisions of the Act and the rules and communicate the order to the petitioner within two months of the receipt of intimation of the order". On September 28, 1995, a letter was issued by the department to the secretary of Mandibisi Mahtla Mandal informing that it was not possible to give lease for those MFP items which had already been leased out to the TDCC. Yet, the letter continued, the Mahila Mandal may apply for 10 items (listed out in the letter, and most of them not available locally) which had been leased out to the Utkal Forest Produce (UFP). The letter further states that after the end of the lease period of the TDCC, the Mahila Mandal may apply to the department of forest and environment for consideration. The letter, however, does not state when the

period of lease held by the TDCC terminates, nor the MFP items held in lease by the TDCC.

TDCC AND SELLING OF TRIBAL RIGHTS

The TDCC has been set up with the stated and explicit purpose of facilitating market, and ensuring a fair price, for tribal products. Its objectives are as follows:

To procure surplus agricultural produces and minor forest produces from the tribals at a fair and remunerative price, and arrange for their marketing.

To supply essential commodities to the tribals at fair price.

To arrange for processing of procured commodities to add value to the product with the view to increasing profitability and thereby providing employment to them.

Advancing for consumption-cum-production loan to the tribals to meet their resource requirements for crop raising and also for meeting their consumption needs.

And further, the role of the corporation is enumerated as below:

The main role of the corporation is to uplift and boost the tribal economy and safeguard

the interest of the tribals by marketing the tribal produces through the TDCC by way of giving a good support price for their surplus agricultural products and MFP.

Despite this clear purpose, the actual working of the TDCC is achieving just the opposite. The government constitutes a price fixation committee at the district level every year to fix procurement prices of MFP items. The agency which has the lease has to pay these minimum prices to the collectors. Yet surveys indicate that most MFP items are sold by the primary collectors at rates less than 50 per cent of the fixed procurement price. In the case of hill brooms, the actual price varies between one-third and half the procurement price. Most transactions with the primary collectors are made using approximate volume measurements. Standardised weights are almost never used. In many cases, people report, stones are substituted for the standard weights.

Though TDCC would like to project an image of the benign arm of a protective state, there has been consistent failure of the TDCC to give the primary collector the declared price. The TDCC's inefficiency in

procurement has enabled the petty traders and the local businessmen to secure a major market, amounting to more than two-thirds for most of the items held in lease by the TDCC. According to the reports of the corporation, "Owing to continuous loss sustained by it, the corporation's share capital has been completely eroded and the business activities at present are being carried on by borrowing". The interest on loans taken by the TDCC as working capital, comes to about two crore rupees annually. Running losses since inception, its cumulative loss up to the year 1993-94 amounts to Rs 31 crore. The corporation has an overhead cost of Rs 1.81 crore annually, against which the government releases a managerial subsidy of Rs 20 lakh per annum, which is not even enough for one month's salary. The TDCC is inefficient, which has forced it to surrender six MFP items: Siali leaves, soap nuts, patal garud (a medicinal herb), sabai grass, siali fibre and lac. But additionally, the TDCC is costing the state substantially for its maintenance. The TDCC also owes several crores of royalty to the state government.

A series of other products have been contracted by private parties. The UFP has a 10 year lease for 29 MFP items. Thus, despite the existence of the TDCC, the tribal is mostly left at the mercy of the private trader. These agencies holding the lease for various items over the entire state, play havoc with the pricing. In many divisions, sal seeds, which have been leased out to UFP and Preeti Oils have not been procured since 1995. The government has also chosen to cut down the procurement price for sal seeds from Rs 2.50 to Rs 1.75 per kg to facilitate the operations of these companies. The tamarind lease for the entire Koraput division, which had been held by the TDCC till 1994, was handed over to a private businessman in 1995. But the Mandibisi Mahila Mandal, which have been requesting permit for hill brooms for the last three years, has been refused permit this year too.

In a study titled 'Forest Policy and the Rural Poor in Orissa', NC Saxena, the director of National Academy of Administration, notes, "the present arrangement in Orissa of leasing entire forest divisions to private industry is even worse than the system of appointing labour contractors, which was abolished in the late 1960s". Stating the case of Orissa government's decision to assign bamboo forests to industry, appointed as sub-agents of the OFDC, Saxena points out, "the order appointing industry as 'raw material procurer' goes to the extent of stating that other terms and conditions may be settled on consultation with the industry. This must be the only case in government, where lessees are appointed first and then left free to lay down their terms." The study points out that the poor and the landless are forced to meet

their demand for bamboo by stealing while the industry gets subsidised bamboo. The cost of bamboo for the industry works out to 15 paise per piece, while local cultivators who own land have to buy at Rs 4.30 per piece. To the landless, even this facility is denied.

The commercial importance of MFP has led the state to nationalise almost all the important MFP items. This has effectively cut down the number of legal buyers, and denied a fair price to the gatherers. However, contractors, who must now operate with higher margins to cover uncertainties with the government agencies, and underhand deals with the police and other authorities, still manage entry through the backdoor. On the other hand, across-the-border smuggling operations enable a higher pricing as these do not have to deal with state controls. This smuggling goes on unchecked and extensively in most border areas.

The case of Mandibisi Mahila Mandal is not an isolated case. In numerous instances across the state, there is a persistent struggle of tribal and other indigenous communities to access and use their forest and land resources. Government policies and their misuse is increasingly denying the tribals the access to their livelihood needs. As a sequel, the government has been able to ensure neither the due revenue, nor the conservation and protection of the forest resources. All this amounts to a blatant violation of the human rights of these communities. The government needs to answer how it can talk of and promote liberalisation, while at the same time throttle its own people with policies of unjust controls, biased completely in favour of private sector interests.

Presently, a collective and concerted movement born out of the experiences of past attempts of various local groups and voluntary organisations is on to consolidate the numerous efforts and highlight the negative impact of present state policy on MFP on tribal communities. Thus, dialogues have been initiated in all the tribal districts, and a sharing of the experiences of different groups concerning the demand for rights over MFP is being taken up. District and block level committees have been formed, and it has been proposed that as a next step, the campaign should be carried out at the state level. One of the significant outcomes of this struggle is the formulation of an alternate policy document concerning MFP. The main points of emphasis of this document are: A clear and transparent policy concerning minor forest produce which ensures that the primary collectors get no less than the equivalent of the declared minimum daily wage rate on the sale of MFP items; stops the monopolistic leasing out of MFP items to private interests and corporations and

enables Mahila mandals, village groups and panchayat level organisation to collect and sell minor forest products in the open market for a competitive prices; provides support to village level organisations for training, for skill development and marketing, and for the setting up of processing units for minor forest produce items; enables the formation of a district level board that acts as a channel of information regarding market, pricing, government programmes and schemes for MFP marketing and processing; prohibits entry to large-scale corporations into those areas of processing of minor forest produce which can be taken up by small-scale industries.

That this policy statement has the backing of the people in tribal areas was amply demonstrated on March 29, the anniversary of martyrdom of Lakshman Nayak, a tribal freedom fighter from Koraput, when thousands of people in the tribal districts of Rayagada, Koraput, Phulbani, Kalahandi, Nuapada, Angul and Gajapati, demonstrated in front of their respective collectorates, demanding rights for collection and marketing of minor forest produce and showed solidarity with the Mandibisi Mahila Mandal and the numerous other groups that have been harassed by the forest department.

Monopolistic trade policies are the surest way to kill initiative and the market, and deny justice to the producers. What is the justification for a democratically elected government to liberalise its economy for inviting foreign companies, while it persists in destroying the economies of its own indigenous communities?

If, as has been suggested in the policy alternative, people are allowed rights over their MFP and are enabled to access the technology and skills required to process it then the tribals would get requisite prices for their items. Local processing units would ensure that resources remain within the community. Rather than talking of exit policies and running after investments from multinational corporations to give a false boost to the economy, the government should consider how best it can use the skills and resources of the people for the wholesome and balanced growth of the economy.

For a Better Deal

Debaranjan Sarangi

The state marketing agency in Kandhamal division of Orissa has stopped buying and marketing plates made from 'siali' leaves, a minor forest produce, threatening the only means of livelihood of the tribals.

WHO should have control over the natural resources – the indigenous tribals or the withering state – this debate has come up once again in the district of Kalahandi in Orissa because of the impasse over the trading of 'siali' plates. The Agency Marketing Co-operative Society (AMCS), Tikabali, the sole purchaser of siali plates in the district has stopped its collection from the tribals because of enhancement of procurement price by Rs 2 per 'chaky' (80 plates) by the district minor forest produces committee. The district is witnessing a series of struggles on the issue.

The committee under the chairmanship of the district magistrate of Kandhamal convened a meeting on July 11 because of relentless pressure from different tribal societies to scale up the price per chaky from Rs 6 to Rs 8. The committee in the presence of the secretary of AMCS, Tikabali passed a resolution for such a hike and as per the government procedure the RDC of Berhampur approved the resolution. The AMCS from its side also printed a large quantity of leaflets carrying the new rate and circulated it in the district for general awareness. The society started collection from August 15, an independence day gift to the tribals. But in mid-September the society stopped its collection on the ground that the price was 'imprudent'.

The AMCS, a government body operating in Kandhamal, Beliguda and Boudh forest division since 1947, has been collecting 18 minor forest produce including siali plates, a major item in the district. In a year the society collects 1,200 to 1,500 truck loads of siali plates and that helps nearly two lakh people of the district to eke out a living, though meagre.

A majority of the sellers to the society are the tribals who travel to distant forests in search of siali leaf and gather 10-12 kg at a time in a normal day. The course of activities, viz., collecting leaves, drying, sizing, stitching and packing consumes a lot of labour time and a man at best can prepare on an average nearly 200-240 plates that is three to four chakics.

Minor Forest Produce (Regulated Business) Orissa Act, 1981 has empowered the committee to enhance the price whenever there is a need. The committee can scale up the price considering the factors related to the development of tribals including the

minimum wages of unskilled labourers prevailing in the state as per government declaration. In the meantime, the state government hiked the minimum wages of unskilled labourers from Rs 25 to Rs 30 in June. The tribals then responded to the government declaration immediately and forced the district magistrate to revise the rate because three to four chakics do not give them even the minimum wages at the rate of Rs 6 per chaky. But turning a blind eye to the development of the poor tribals in the district the Society has approached the high court to revoke the resolution saying that the resolution was 'irrelevant and extraneous'.

Also, under the same act the Orissa government acquired the right on minor forest produce to protect the interests of the poor against exploitation by private traders. For the third time in succession the AMCS has bagged the state Samavaya Award for its financial growth, good management, and service to the hapless tribals in the district. The society was also able to show a profit of Rs 95,14,990 from 1993-94 to 1995-96.

The Society has been the target of people's agitation in the past over the enhancement

of procurement price of siali plate. Earlier in February 1990 when the rate per chaky was Rs 2.50 a series of agitations led to an enhancement of the price up to Rs 3.50 per chaky. The Society was forced to accept the enhanced price.

Now history repeats itself. The tribals themselves have launched a struggle over the issue again. On October 10 a massive rally of nearly 10,000 people was held at the district headquarters to force the Society to accept the new price. The entire region is affected by the agitation but nothing has deterred the Society from its decision. The Society appears to have had good relations with its purchasers, the private traders of the nearest town who market the siali plates and the former is protecting the latter's interest because such enhancement of prices would affect the traders' profit. Either the district administration which should have implemented the rate had no inkling of the circumstances related to the resolutions or was playing a dubious role in the entire situation. However the district is seeing the distressed sale of siali plates at Rs 3-4 per chaky.

The AMCS' harsh decision comes at a time when the entire district is reeling under a severe drought. Though other parts of the state are also affected and there have been reports of starvation deaths, the people of Kandhamal district would have been able to eke out a living through the sale of siali plates. But if the impasse continues longer starvation deaths as in adjacent districts may well occur here.

Bogus Debate on Bioethics

Suman Sahai

The debate on biotechnology and bioethics on Indian platforms thrives on rhetoric and metaphors directly lifted from the west. India cannot evaluate genetics or any other science in such a manner. It will have to create its own paradigm, answering its social needs.

KEEPING pace with the growing importance of biotechnology and its potential to address some of our urgent food and health care needs, a spurious and somewhat bogus debate on bioethics is being started in India. This debate which is essentially a debate on the ethical problems associated with genetics and biotechnology, is being kicked off on the seminar/workshop circuit where a certain section of Indian intellectuals solve the nation's problems when they are not solving them on international platforms. Like many of the arguments offered against biotechnology, the debate on bioethics with its rhetoric borrowed from the west and its plagiarised metaphors, is not Indian in context or substance and far from being relevant, it is really something in the nature of a red herring.

The concern with bioethics is essentially a western phenomenon. In these countries one of the more visible reactions to the growing strength of genetics research is the ethical dimension of this research and its application, particularly with respect to humans. The bioethical debate attempts to come to terms with a fascinating new science which has challenged many of biology's and philosophy's existing frontiers.

Bioethics is a subject of concern almost everywhere in Europe and America but the debate is sharpest in Germany. There are several reasons why this is so. Most important perhaps is Hitler's Third Reich and the utterly reprehensible programme of eugenics practised by the Nazis. The latter believed in the superiority of the German (Aryan) race and launched on the annihilation of six million Jews for as much economic jealousy as distorted concepts of racial superiority. In addition they killed off a few hundred thousand gypsies, and old and disabled Germans.

This is bad enough; what is worse is the complicity of some scientists and medical men of the Third Reich in what must rank as mankind's most grotesque crime. Biologists and geneticists of a certain hue fell in with enthusiasm to provide the scientific framework and expertise to carry out these terrible plans. Monsters like Josef Mengele experimented with genetically determined eye disorders and blinded whole families of gypsies where this disorder was found, to study the nature of the defect. It is no wonder

that after the Third Reich, genetics is suspect among certain sections in Germany and the rather extreme view that nothing but evil can come from this science has gained currency in radical fringes.

Another important reason for the resistance against genetic research lies in the very basis of the Judaeo-Christian faith. This has created the philosophical underpinnings for a society that finds "interference" in God's work an unacceptable arrogance and something that is evil and unethical. Each philosophy grows out of the soil of its religion and culture. According to Christian belief, God has created all living creatures and He has created man, His supreme creation, in His own image. It is this belief in the very special nature of man that militates against a science that presumes to improve upon God's work. The language of the ethical objections voiced by the church and by many philosophers is explicit. Genetic manipulation, including gene therapy to correct genetic disorders, violates "the dignity of man". This inborn dignity derives from the fact that man has been created in the image of God. This is a powerful reason for those who believe, to reject a science that interferes in divine work.

It is interesting that the operative words which appear in the concerns and the rhetoric voiced by opponents of genetics, are not so much 'genetics' or 'genetic sciences' but 'genetic engineering', 'gene manipulation' and 'gene technology'. All these terms are suggestive of interference and are dehumanising in the sense of reducing life, specially human life, to a mere technology and robbing it of its extraordinary status. The language of the objection reveals much of the basis of the objection.

With respect to the violent objections to biotechnology as the application of genetics and genetic engineering, the unspoken rationale of German and other western societies is logical for their context and economic situation. The fact is that all these are countries that are not only self-sufficient in food, they have a standard of food availability and choice that perhaps cannot be bettered.

Not only are these countries secure in their food supply, they produce such volumes of surplus that it is costing increasing sums of money to destroy the

mountains of fruit and vegetables, the lakes of milk and wine, and the stacks of meat and butter. In 1993, for example, it cost the Europeans over 3.6 billion dollars to destroy in an environment-friendly way, the surplus fruit and vegetables that could not be consumed or processed.

The other field where biotechnology is showing potential is in the synthesis of vaccines and drugs. Many drugs like insulin and tPA, a drug against blood clots, are much more cheaply and easily available through biotechnology than through conventional methods. The possibility of manufacturing cheaper, more efficient life-saving drugs like antibiotics and anti-leprotics is another one of the promises of genetic engineering. Although concrete results are thin as yet, the potential for creating vaccines for the large number of diseases afflicting the poor in the developing countries, is promising.

Western societies where the dangers of the biotechnological route to drug production are the subject of intense and emotional debate are societies that are fortunate to enjoy excellent medical cover. These are also societies where medical insurance assures practically every citizen (perhaps less so in the US), a high quality of medical aid at a subsidised, reasonable price. These are not societies that have to confront deaths because of epidemics or children disabled because of lack of vaccines. For affluent western societies, procuring medical aid is not an urgent and desperate social need. They can be finicky as to which kind of medication, from the several available, they wish to have.

It would be clear after tracing some of the important reasons leading to the often unbalanced concern about genetics in European societies, that these are arguments and reasons that do not apply to us in India. Yet, those who speak in our country about ethical objections and the dangers of genetics and genetic research, do so on the basis of western concerns. So we hear objections based on violating the dignity of man, on the dangers of gene manipulation creating an army of robots to wage war and conquer the world. We hear of the dehumanising impact of gene technology and the terrifying dangers of biotechnology in agriculture, dairy and food production where monster plants and animals will rise from the field as a result of mixing genes.

The rhetoric is lifted straight from the radical fringes of Europe and repeated almost verbatim on Indian platforms. This has two manifest dangers. One, it reduces the serious subject of ethical appraisal of a science to a ridiculous farce by introducing thoroughly irrelevant arguments. The second danger from this kind of plagiarised argument is creating artificial concerns which will come in the way of our evaluating and using this

powerful science to provide such essential social needs like food and health care.

When we in India discuss the ethical aspects of genetics, we must do so rooted in our own philosophy and religion, reflecting our social and human needs and positing and resolving our own dilemmas and problems in the way that is right for India, not Germany or Europe.

Let us take religious and philosophical arguments different to the Christian belief in the supremacy of man as God's ultimate creation. The Hindus, for example, have the concept that man is part of a continuum of creation, transmutable and changing from birth to birth, depending on his karma. He enjoys no exalted position like in Christian belief. According to Hindu belief, man is not created in the image of God and therefore it is very difficult to argue that genetic manipulation would violate his dignity for that reason. Similarly, the Hindu concept of God/Divinity is more in the nature of an eternal truth without beginning and end as against a finite God of the Christian faith.

The reason I am pointing out these very fundamental differences, and these can be analysed for all faiths, is to point out that the philosophy and culture of a country reflects the religious beliefs of its people. India cannot evaluate genetics or any other science in a western paradigm. It will have to create its own paradigm, reflecting its cultural and religious traditions and answering its social needs. For a multi-cultural, multi-religious people like ours, we will have to formulate ethical guidelines that allow individual freedom and ensure that nothing is imposed on any person or community.

The concerns of Europe are right for Europe. There is little reason for people in a food surplus Europe and US to become excited about the biotechnology route to increase the yield of wheat or potato. Why should they produce still more food when it is already costing them money to destroy what no one will eat. But can we Indians have the same perception? Is it more unethical to "interfere in God's work" or is it more unethical to allow hunger deaths when these can be prevented?

Is the green revolution an unethical, nefarious plot or is it, with all its faults, also the instrument that brought food to the starving poor. Satiated western societies can afford to find fault with the green revolution as an environmental burden that should be done away with. Hungry societies in India and other developing countries will have to balance the overwhelming need for food with protecting the environment. The green revolution will have to be viewed in that light, even as we seek to redress the imbalances created by it, and in searching for better methods of food production, jettison those factors that have been proven to be detrimental.

If there is an outcry in the west against the hormone Bovine Somatotropin, which increases milk yield in cows, it is entirely logical for a society that is afloat in an ocean of milk. What on earth will they do with still more milk when they can not dispose of the surplus that they are already producing. But is it logical in India, a country with severe milk shortages, where children do not get minimal nutrition and where starvation deaths are not infrequent? Should India with its acute fodder shortage and a bovine population that gives about two litres of milk a day, spurn a product on ethical grounds that has the potential to improve the fodder conversion ratio and allow a cow to produce more milk from the same fodder? Is BST an acceptable product in India on ethical grounds?

Should we allow ourselves to be hemmed in by borrowed ethical arguments when it comes to the critical area of raising agricultural production? In India where post-harvest losses destroy upto 40 per cent of the food we bring in from the field, should western hysteria about biotechnology be allowed to get in the way of making agricultural products more durable and amenable to processing. Should 60 per cent and more of the fruit grown in the economically weak hill regions be allowed to rot because it cannot be sold or should we try to produce fruit varieties in which the rotting process can be delayed.

The resistance in some sections of western countries to the genetically engineered Flavr Savr tomato which does not rot quickly, is to be seen among other things, in the context of the mountains of tasteless tomatoes being produced in intensive cultivation modes in countries like the Netherlands. Suppose however that genes to hold back the rotting process in apples or pears are located, let us say not even

in apples and pears, but in cauliflower, should the imported ethical paradigm stop us from conducting research to transfer the gene from cauliflower to apple and so enhance the earnings of hill farmers by lakhs? What should our ethical considerations be?

Unfortunately, the issue of bioethics is often being confused with that of biosafety in the sometimes incoherent debate on genetics and genetic application. The crucial significance of biosafety which is one of the most important aspects of research in genetics and biotechnology cannot be overemphasised. Whereas different interpretations of ethics are needed and are desirable, no divergence is possible in interpreting the importance of safety protocols when considering the release of genetically manipulated organisms.

Different countries can have strict or very strict protocols for biosafety. No one however denies that genetically changed organisms must be tested with the utmost caution in the laboratory and in controlled field conditions before being sanctioned for release.

The aim of developing societies should be to harvest the power of science and technology to improve the living conditions of their people. That is one of our most important ethical compulsions. The new science of genetics has raised complex issues of science, ethics, society and its well-being and its moral dilemmas. These issues need a sophisticated, reasoned response that addresses the complexity of the problems. It is much too simplistic and totally inadequate to rely on charged hyperbole and bans forbidding the practice and use of science. Above all, the concerns and debates in each society must be relevant to that society and rooted as much in its needs as in its culture.

The Other Side of Development

Maharashtra's Backward Regions

H M Desarda

Maharashtra's backward regions, Vidarbha, Marathwada and parts of the Konkan have suffered not only because of sheer neglect, but also because the growth model of western Maharashtra is being foisted on a region with different agro-climatic and socio-political features.

BY common conventional and commercial yardsticks of economic growth Maharashtra is an economically and industrially 'advanced' state of the Indian union. The per capita income is one and half times the all-India average and double that of Kerala and triple that of Bihar; per capita electricity use is twice the Indian average; the proportion of urban population in Maharashtra is 38 per cent whereas that of India is 26 per cent. If we take consumer durables like cars, two-wheelers, colour TVs, washing machines, air-conditioners, telephones, faxes and services of public and private airplanes, five star schools, hospitals and hotels, it is way above the Indian average.

The capital of the state, Bombay is often referred to as commercial capital of the country. Bombay with high profile business headquarters, financial institutions, film industry, ultra five star hotels, underworld dens, pimps and prostitutes, goons and gangwars has become the 'world class city' and the centre of commerce. Not only do the traditional industrial trade and mercantile houses wallow in wealth but also the whole *nouveau riche* class—of builders, contractors, diamond and jewellery merchants and a new breed of consultants be they doctors, decorators, architects, advertisers, engineers, chartered accountants, tax advisors, share brokers and wheeler-dealers of all kinds—have turned Bombay into a symbol of India's catching-up-with-the-west process. Top class industrial and commercial gentry, professionals, bureaucrats and politicians and the upper middle class numbering between 1.5 and 2 million are the elite who set the politico-economic agenda of India. Will the change of name to Mumbai mean any change in all this?

Against the backdrop of this dominant trend and the direction of the state's economy we have to ask: what is the state of Maharashtra's 85 million people today? In the highly industrialised and urbanised Bombay Metropolitan Region nearly half the population lives in slums with scanty provisions of drinking water, sanitation, health, hygiene, housing, etc; literally five to six million people live next to latrines, on pavements, plinths, platforms and have no access to anything called civic amenities.

Yet, Mumbai is perceived and portrayed as a paragon of 'new' India with its paraphernalia of avarice, greed and consumerism. Lamentably thousands of

people from all parts of India migrate to Mumbai to eke out a livelihood often by despicable and hazardous means. In fact, the conditions in many corporation towns like Thane, Pune, Pimpri-Chinchwad, Amravati, Nagpur, Aurangabad, Kolhapur, Solapur is no better. In many rural areas also the physical and human environment is no better. There is no planning of human settlements and money and muscle power is the main arbiter and is ruling the roost. The populist gameplan of the erstwhile and present ruling parties has complicated and compounded the problem. It is not an accident that such a situation and scenario has emerged. This is the fall-out of the faulty policies and mistaken perceptions about the growth and development

ECOLOGICAL TOLL

The pre-valing path, paradigm, and programmes of development are socially unjust, economically resource-squandering and environmentally destructive. As such, for the short-term good of the few it inflicts long-term ecological costs on a majority of the people. The *Human Development Report* has revealed the misleading character of the conventional professional indices of measuring growth and welfare like a higher share in GDP of manufacturing goods and infrastructure and services, level of urbanisation and industrialisation, per capita income, per capita use of electricity, number of vehicles, use of chemicals in agricultural and industrial production, degree of mechanisation, extent of irrigation, etc. Globally there is increasing acceptance of this approach. It distinguishes growth from development. The conceptual category of 'backwardness' sans the above attributes and parameters of development is used as a cover to demand growth projects of little real worth to the large majority of the people. Indeed, there is backlash of this kind of growth process. This is what is happening in Konkan, Marathwada and Vidarbha regions and a few other districts in other parts of Maharashtra.

To assuage the feeling of neglect and lag in these regions the constitutional provision afforded by the article 371(2) has been revoked recently and the three separate Statutory Development Boards have been set up in Maharashtra. Under these boards the governor will ensure balanced and equitable development of all regions of the

state. In accordance with the principles enunciated by the State Reorganisation Commission the aspiration of the regions and people constituting Maharashtra were to be promoted and their cultural identity preserved. The political and populist overtones have been shrewdly exploited by the ruling elites. The setting up of statutory boards is an outcome of that arrangement.

Unfortunately, sincere workers and a section of the freedom fighters who have made utmost sacrifices in the struggle against the feudalism of the Nizam of Hyderabad and other petty feudal chiefs in Vidarbha have fallen prey to this rhetoric and have become the protagonists of a resource-squandering process of growth. Over the years the problems of the common people have been compounded and the life-support system has continuously deteriorated, thereby accentuating the problems of poverty and unemployment. As of now, several thousand villages and many towns are experiencing acute scarcity of drinking water. In fact, this is a telling example of the unsustainable character of the current development process. It is a symptom of a much deeper malady, the topsy-turvy nature of the present project-oriented growth process. Capital-intensive industry has been conceived as an engine of growth. In the socio-political context of Maharashtra the Bombay-Thane-Pune-Nashik pattern of industrialisation and Satara-Sangli-Nagar-Kolhapur paradigm of agro-industries, basically sugarcane-based industries, became the prime model of the state's economic growth, a new idiom of rural and agricultural revival.

Vidarbha, Marathwada and even Konkan regions which are agro-climatically so different deemed western Maharashtra as a 'model' for growth. Co-operatives became the springboard for rising in the leadership ladder. The Sena-BJP government and leaders want to follow the same path to establish their hegemony.

Secondly, in terms of infrastructure, irrigation and power were considered the major means of pursuing this growth model. For a long time, more than half of the state's plan funds are spent on these two sectors. The clamour for allocating more and more money for major and medium irrigation projects has led to competing claims from the different regions and interest groups. Injured feelings of regional imbalance and particularly separatist sentiments in Vidarbha were part of the armoury of political leaders who used it to pander and whip up emotions and subserve their narrow self-interest of syphoning money and capturing political power.

Of course, this does not mean that there are no just demands and genuine grievances in these regions and these led to the new pulls and pressures in early 1980s. The government appointed a fact-finding committee which submitted its report in 1984. The upshot of the report has been an identification of 'developmental backlog' of Rs 3,185 crore in a few selected sectors, the

major heads being irrigation (Rs 1,385 crore), roads (Rs 600 crore) and rural electrification (Rs 300 crore). Not only the districts in traditionally known backward districts but almost every district including Mumbai had a 'backlog' in one sector or other. Though the government has not taken any clear and definite position about the approach suggested in the report it has agreed to make good the backlog in specified sectors during the Seventh and Eighth Plan. The latest available figure shows that in the past 11 years twice the amount of the estimated monetary backlog of Rs 3,285 crore has been spent. However, the physical achievement is way behind and almost an equal amount is required to achieve the stipulated targets. A glaring example of the dismal performance is reflected in the expenditure of the irrigation sector. Against the designated backlog of Rs 1,385 crore already Rs 2,538 crore have been spent. But as against the designated actual physical backlog of nearly 14 lakh hectares to be brought under irrigation hardly half the target has been achieved. In other sectors the story is no different.

Marathwada is one region where during the past two decades nearly Rs 1,500 crore have been spent on different types of water use projects and the net outcome is that in actual terms not even 50,000 hectares are irrigated by the canals. Interestingly enough

the irrigation department statistics says that the potential 'created' is to the tune of 7.5 lakh hectares – not even a 10 per cent achievement. In the region's major prestigious project Jaikwadi the irrigation benefit is even less than the area submerged under the project. This has become a classic story of pumping large sums of money but no water comes out! It is all either dead storage or some lift flow directed to non-irrigation uses at a great cost to the exchequer and the community. The moral of the story is: Dams are not built to provide water to the parched earth and thirsty people but to provide windfall gains to engineers, contractors and their political godfathers. Consequently, nearly half of the 8,000 villages in the Marathwada region requires water supply by tankers. In this very region there is glut of sugarcane. What kind of planning and public policy is this? Notwithstanding all this, new sugar industries are being 'commissioned' by the ministers of even the new supposedly non-sugar baron government. A recent conference of the Marathwada Vikas Parishad at Latur, in its resolution on water, has expressed deep concern and resentment about the scandalous state of affairs in this most crucial sector.

After Marathwada now the main squanderer of the money in the name of 'irrigation' is the Vidarbha region. The

region's major investment project is on Vainganga river known as Gosikhurd the cost of which in 10 years has gone up from Rs 300 crore to Rs 1,600 crore. This year a provision for this white elephant has been hiked from Rs 2 crore to Rs 50 crore. Now, the irrigation minister of the state is from Vidarbha region and it is 'their' turn to squander money. Booking for the state's share of Krishna water by 2000 AD is another handy ploy to seek money through bonds and NRI investments. Jai Maharashtra!

It is high time to take hard look at these realities. 'More of the same' is simply no solution. Alternative ways and approaches to harness water resources on a sound and scientific basis are the prime need of the hour. Clearly there is a clash between the present engineering and technocratic methods and the alternative socio-ecological perspective. The latter being holistic is equitable and sustainable and through that alone can people-oriented water resource development and socio-economically sound growth be accomplished.

A peoples' movement to challenge the current growth processes which are parasitic and resource-squandering seems to be the only answer to balanced regional development, which should be firmly rooted in the specificities of factor endowment rather than copying the west or western Maharashtra.

New from Oxford

Prasanta Chandra

Mahalanobis: A Biography

Ashok Rudra

Prasanta Chandra Mahalanobis (1893–1972) pioneered the use of statistics in India. He was the founder of the Indian Statistical Institute, the Central Statistical Organization and the National Sample Survey. Besides building the statistical database of the Indian economy, Professor Mahalanobis was the architect of India's Second Five Year Plan. Using old letters, diaries, and published material along with interviews of his associates, Rudra constructs an all-round, warts-and-all account of Mahalanobis' life.

Making India Hindu

Religion, Community, and the Politics of Democracy in India

Edited by David Ludden

Making India Hindu explores Hindu majoritarian politics over the last century and its dramatic reformulation during the decline of the Congress Party in the 1980s. Twelve prominent scholars from India, Europe, and the United States provide perspectives from the fields of political science, religious studies, history, art history, and anthropology, comparing trends in India with ethnic, religious, and cultural movements in other parts of the world.

356 pp. 1996

Indian Development

Selected Regional Perspectives

Edited by Jean Drèze & Anantya Sen

It begins with an analysis of the persistence of endemic deprivation in India and the role of public action in dealing with the problem. This is followed by case studies of development in three states. These case studies investigate the links between public inertia and endemic deprivation in Uttar Pradesh, the impact of radical politics in West Bengal, and Kerala's development achievements, respectively.

Turko-Lingual States Make Common Cause

R G Gidadhubli

While regional compulsions brought together the six Turko-Lingual States to sign a declaration of solidarity and co-operation at Tashkent recently, much depends on how they can reconcile their differences following upon their different economic histories.

THE fourth high-level meeting of the heads of six states of Turkic group of languages was held in Tashkent, the capital of Uzbekistan on October 21. The six states are, Azerbaijan, Kazakstan, Kyrgyzia, Turkmenistan, Turkey and Uzbekistan. This grouping is yet another effort by the former Soviet Central Asian republics to forge links and to assert their regional identity, to consolidate their independence and to integrate with world economies. This meeting coincided with the celebrations of the 660th jubilee year of Amir Taimur, the great Uzbek emperor who conquered and ruled a vast territory from Mongolia in the east to Turkey in the west and the border of Russia in the north to the border of India in the south.

The presidents of the six countries expressed satisfaction at the growing fraternal ties among the Turko-Lingual States (TLS) efforts for which were initiated in the previous meetings at Ankara and Istanbul in Turkey and Bishkek, the capital of Kyrgyzia. The heads of TLS have reaffirmed the principles of respect for independence, sovereignty, equality, territorial integrity, inviolability of borders and non-interference in internal affairs of one-another. This regional moral group support on border issue seems to be particularly significant and helpful to some members of TLS - Kyrgyzia which has some border problem in the Osh region with Tadzhikistan and Azerbaijan has differences with Armenia on the Nagorno-Karabakh region.

Bilateral and multilateral relations are reported to be developing well among the TLS in order to promote cultural-historic ties and enrichment of Turkic languages and Turkic civilisation. These states propose to work jointly for the realisation of the programme of rehabilitation of the silk route by developing infrastructure facilities and opening up of avenues for attracting tourists with the involvement of local government bodies and non-governmental agencies. The heads of TLS seem to be happy about the progress made in these tasks.

The objective of the Tashkent meeting is not to confine only to these language and cultural issues. In the Declaration there is significant emphasis given to develop trade and economic co-operation among the TLS and more importantly to work for the establishment of a common market for trade, services, capital investment, offering

employment opportunities without adversely affecting the international commitments of individual members. In the Declaration it is asserted that for achieving this common market steps are being taken for simplifying customs and transit procedures and resolving constraints which are affecting mutual trade, banking and financial operations.

TLS being rich in natural resources particularly in oil, natural gas, gold, non-ferrous minerals, cotton, etc, it is proposed to undertake joint projects for exploitation and transportation of these products to world markets. Besides making joint efforts, TLS hopes to attract other interested countries and international financial institutions and private agencies. Work is being carried out by member states jointly with international organisations for laying pipelines through Turkey to the Mediterranean sea to facilitate export of oil and natural gas to Europe. This route when completed will not only reduce the distance but will bypass Iran much to the desires of some western countries. The TLS have emphasised the need to speedily develop transport networks, namely, Trans-Caucasian corridor for which the European Union has lent support and the proposed 'North-South' corridor from central Asia through Afghanistan and Pakistan to the Indian Ocean.

The Central Asian countries of the former Soviet Union have undertaken the programme of economic transition - privatisation, price liberalisation, opening up of their economies in order to integrate with world economy. The heads of TLS have called upon international organisations such as World Bank, IMF and other regional banks to actively co-operate in the programmes being undertaken by them in this transition period. On their part, the central Asian countries propose to undertake measures to stimulate economic growth by investing more capital, developing human resources and skills, developing new technologies and promoting small- and medium-scale businesses.

Two other issues that are highlighted in the Tashkent Declaration are firstly, the need to jointly fight against illegal production, trade and transit of narcotic drugs and fight against narco-business which, the members are aware, leads to and is a source of terrorism. Certain parts of central Asia are already

affected by this problem since climatic and natural conditions are conducive for growing poppy and producing opium. Moreover, central Asian countries are being used as transit points to transport drugs to the west. Secondly, TLS heads have emphasised the need to co-operate in protecting environment particularly in the Aral Sea region.

The desires to organise regional grouping on the basis of common linguistic and cultural heritage is understandable. By organising international seminars and conferences the TLS propose to propagate and enrich the same as it is envisaged in the Declaration. However, significantly despite being predominantly Islamic countries there is no reference in the Declaration to religion which shows that the TLS give more importance to building secular societies not encouraging religious fundamentalism. This could be an important to Pakistan which harps on religious aspect in its relations with the central Asian countries.

Notwithstanding ongoing efforts being made by the TLS to promote their socio-cultural and economic ties, the realisation of their objectives depends upon how they will resolve problems facing them and how they will reconcile certain differing perceptions and interests. For instance, in 1994 Uzbekistan, Kazakstan and Kyrgyzia had entered into an agreement for doing away with customs posts for facilitating trade and tariffs. Despite this there were reports about difficulties in the movement of goods at the borders among these countries. Similarly, punitive economic measures were being considered by some of these countries for realising arrears of payment for the supply of coal, electricity, etc. For achieving the objective of a common market the TLS will have to resolve such issues.

Considering that the central Asian states are in the process of transition, the pace of reforms differs from country to country. While Kyrgyzia has made substantial progress in price liberalisation, privatisation and reforming the banking sector, Azerbaijan has to go a long way in this regard. Turkey is a case apart since it has been a relatively developed capitalist economy closely linked with the western world. In fact, in 1992-93 the Turkish 'model' of political democracy and market economy was considered and even recommended to be ideal for central Asian countries to emulate, but they have subsequently reconsidered the matter. Turkey has been one of the key players in the central Asian economies both in terms of trade and joint ventures. Turkey has been utilising linguistic and cultural bonds to promote its own Pan-Turkic ambitions in the central Asian region. However, Uzbekistan which has evolved its own Uzbek model of development where the state will play a key role in regulating and guiding economic reforms and evolving market institutions, has demonstrated remarkable success in achieving economic progress and is even

called the emerging tiger in central Asia. The Uzbek president Islam Karimov has repeatedly called upon other central Asian republics in rebuilding 'Turkistan our common home'. Hence both Turkey and Uzbekistan may try to assume leadership in the TLS region. Even in the Tashkent Declaration which has emphasised the development of new transport routes, while the one linking the Mediterranean Sea will give greater advantage to Turkey, the 'north-south corridor' via Afghanistan-Pakistan linking the Indian Ocean will give greater advantage to Uzbekistan. Kazakhstan which has the largest territory among the member states in the region and has vast potentialities of energy, mineral and agricultural resources may also aspire to exert its own position in the TLS regional block using its Russian card being close to Russian Federation and having the largest Russian ethnic community in its country.

Apart from this, there are many issues on which there is competition among the TLS, although on a few issues there is complementarity among them. For instance, Kazakhstan has been a traditional supplier of foodgrains and oil to Uzbekistan and partly to Kyrgyzia, thus complimenting each other. Turkey has been supplying a wide range of consumer goods, machinery and equipment to other members of TLS. Despite this, competition though implicit at present, exists between Turkmenistan and Kazakhstan which

are both exporters of oil to the world markets. Uzbekistan and Turkmenistan are rich in natural gas and both want to export it to earn much needed hard currency. Similarly, in the case of gold and non-ferrous minerals, Kazakhstan, Uzbekistan and Kyrgyzia are competitors to get foreign capital and technology for exploitation of these rich resources and for export to the world markets. Future economic development and success of transition depends upon their ability to export their immense resources and earn hard currency, and for achieving this each country would like to give priority to safeguard its own national interest. But most of the TLS members being landlocked realise that their individual interest cannot be served without some joint efforts to take up their common causes. Hence motives for regional co-operation rely much on this complex reality.

It is a matter of great significance that during the last couple of years the central Asian republics of the former Soviet Union have become members of several regional groupings. TLS is one of them. They are also members of the Organisation of Islamic Community (OIC), Economic Co-operation Organisation (EKO), Organisation of Caspian Sea countries, etc. What has compelled them to join several regional bodies is not only their need to establish their identity in international bodies, but also to reduce their dependence on Russia and

project their own interest. The emergence of nationalist tendencies in Russia which was particularly reflected in the rise of popularity of Vladimir Zhirinovskiy coupled with Russia's new military doctrine which seemed to imply the right to use force for protecting the interests of Russians in the countries of 'near abroad' could have hastened their intentions.

It is understandable that after the Soviet disintegration, the central Asian states and Azerbaijan have decided to develop their own respective languages declaring them as the national language in respective countries giving due priority to the national language as medium of instruction in education. However, Russian language is being widely used and it is significant that the text of Tashkent Declaration prepared in Turkic and Russian languages was signed by the six heads of the TLS.

Considering the complexities involved in any regional groupings, what has been achieved so far seems to be modest. But the TLS heads seem to be earnest in their determination to continue their effort. This is further evident from the establishment of a special secretariat for monitoring and promoting their common linguistic, cultural and economic programmes including those agreed upon in the Tashkent Declaration and the decision to hold the fifth meeting of the heads of TLS in the fourth quarter of 1997 in Alma Ata, the capital of Kazakhstan.

NATIONAL COUNCIL OF APPLIED ECONOMIC RESEARCH

"Parisila Bhawan", 11-Indraprastha Estate,
New Delhi - 110 002

IFCI Chair on Industrial Development at NCAER

Applications are invited from suitable candidates for a chair on research in Industrial Development instituted by the Industrial Finance Corporation of India (IFCI) at the National Council of Applied Economic Research, New Delhi. The designation of the incumbent shall be that of "Chief Economist".

Age	:	38 to 50 years
Qualifications	:	Ph.D. in the relevant subject from a reputed Indian or Foreign University; research experience in Industrial Development either in a University, an independent research organisation, in a corporate enterprise or in Government. Candidates should have capacity for conducting independent research, ability to write clearly and succinctly and to lead a research team.
Experience	:	8-10 years of research in industrial development.
Nature of work	:	To guide research on his area in NCAER, and produce research papers in Industrial Development.
Duration of the Chair	:	Initially for 2 years but could be extended.
Emoluments	:	Range Rs. 15,435/- to Rs. 20,640/- per month (Gross).

Other things remaining the same, candidates belonging to SC/ST and other backward and minority communities will be given a preference.

Candidates will have to appear for interview at New Delhi and will be reimbursed first-class train fare by the shortest route to and fro from the place where they are presently working.

Applications with full particulars of qualifications and experience together with copies of published papers/reports, should reach the Registrar & Secretary at the above address by Tuesday the 24th December 1996.

Public Policy and the Financial System

A Dilemma of Two Cultures

N A Mujumdar

The financial sector reforms introduced as part of economic liberalisation have done the economy more harm than good. Any reforms that we introduce must be judged by the test of their relevance to the specific Indian socio-economic milieu, and the 1991-96 reforms fail this test. The initiatives taken by the United Front government appear to appreciate this point.

THE global economic environment that we are confronted with and the accepted approaches to economic development are quite different today from what they were in 1951 when we embarked on a course of planned development. Today central planning stands discredited. Opening up of the economy, deregulation, competition both nationally and internationally, are supposed to unleash the productive energies of the private sector. It is much better for the state to take economic *Samnyasas* so that we may graduate into a market-driven economy. This is perhaps the essence of the so-called 'Washington Consensus' which is supposed to be applicable, in terms of macro-economic management, to not only developing, but also emerging and transitional economies.

Against this broader background, I wish to explore the main elements of what should be the appropriate approach to the development of the Indian financial system. The subject merits careful attention for at least two important reasons. First, the distinguishing characteristic of the financial markets. As Joseph Stiglitz emphasises: "Financial markets are markedly different from other markets: market failures are likely to be more pervasive in these markets; and there exist forms of government intervention that will not only make these markets function better but will also improve the performance of the economy".¹ Financial sector reforms, carried out in India during 1991-96 do not seem to reflect an appreciation of this special characteristic. The second reason relates to the evolution of the Indian financial system itself. For convenience of discussion this evolution can be broadly divided into three distinct phases: the first phase covering the period 1969 to 1991 may be termed the post-nationalisation phase. The second phase covering the period 1991-96 is the period of liberalisation and of reforms of the financial sector. It is this phase which needs to be really subjected to closer scrutiny since it epitomises misguided enthusiasm on the part of the monetary authorities to mimic what one might call the Washington model,

ignoring the ground realities of the specific Indian socio-economic milieu. The third phase begins with the emergence of the United Front government in the latter half of 1996. This phase represents a return to realities in the sense that the government has taken a number of initiatives which clearly mark a departure from the Washington model. These initiatives include: a commitment to double the size of rural credit during the next five years, doubling the share capital of NABARD, establishment of state-level development financial institutions with the objective of promoting investment in commercial and high-technology agriculture and the setting up of private local area banks (LABs) with jurisdiction over two or three contiguous districts. Also, the new government is committed to a cheap money policy.

I would seek to show that the reforms introduced during the second phase, based as they were on the Washington model, did more harm than good to the economy. Furthermore, if only the authorities had chosen to take a leaf out of the east Asian experience, rather than imitate the Anglo-Saxon model, the results would have been far more beneficial. Any reforms that we seek to introduce should be judged by the test of the degree of relevance to the specific Indian socio-economic milieu, and the 1991-96 reforms fail this test. The initiatives taken by the new government appear to appreciate this point and hence one can look forward to the third phase of the evolution of the Indian financial system with greater hope.

THREE PHASES OF EVOLUTION

The Indian banking and financial system has made, during the two decades since nationalisation, commendable progress in extending its geographical spread and functional reach. The spread of the banking system has been a major factor in promoting financial intermediation in the economy and raising the savings rate from some 10 per cent to around 25 per cent. Secondly, the banking system now caters to several million borrowers especially in the agricultural

sector, small-scale industries and the self-employed. Even the critics of nationalisation concede these achievements of the financial system – achievements which are well documented. For the present purpose what needs to be highlighted is that during this phase, policy-based credit programmes created an ethos among bankers, especially public sector bankers, a commitment to credit disbursement designed to promote growth. Credit policy during this phase thus became growth-enhancing, both at the macro and micro levels.

Unfortunately, this ethos, which was so assiduously built up during the first phase was systematically destroyed during the second phase, when insensate profit making seems to have become the central objective. Credit policies during the second phase became, in a way, growth-compressing. Ostensibly, the financial sector reforms were based on the recommendations of the Narasimham Committee.² But it was something more than mere coincidence that the major recommendations of the Narasimham Committee rhymed with those of the IMF/World Bank. Indian policy-makers thus became faithful followers of the Washington model, under the umbrella of the Narasimham Committee. The Reserve Bank of India's (RBI) selective amnesia on credit to priority sectors, total elimination of the element of concessionality in lending rates to small borrowers, textbookish belief in the usurious interest rates as an instrument of credit rationing, wrong prioritisation of the development of capital and public debt markets and the nearly total neglect of issues relating to the rural credit delivery system – all these, taken together, became a bundle of growth-compressing policies, which also symbolised abdication of social objectives. After all, as students of public economics we should judge the consequences of monetary policy in terms of their relation to social objectives.

Of course, some of the reforms in the banking sector, as I have discussed elsewhere,³ like capital adequacy, provisioning, are indeed welcome. Two major components of reforms, borrowed from the Washington model, have harmed the Indian economy: first, directed credit is bad and hence need to be done away with; and, second, interest rates should be market-driven and there is no place for cross-subsidisation. Following this dictum, the Narasimham Committee had recommended that the share of priority sectors in net bank credit should be brought down from the present target of 40 per cent to 10 per cent. Priority sectors should be redefined to include *only* small and marginal farmers, the tiny sector of industry, small businesses and transport operators, village and cottage industries, rural artisans and other weaker sections. The

committee worked out the new target on the basis of the present share of the redefined priority sectors. Fortunately, RBI did not share this pathological aversion to directed credit and left the target unchanged. Even statistically, the Narasimham Committee's recommended target of 10 per cent was flawed, because as RBI pointed out later, the present share of the redefined priority sectors worked out to some 30 per cent. When reformers are in a hurry, it is the disadvantaged sections and sectors which become a casualty!

In practice, however, things turned out to be quite different. Commercial banks defaulted consistently on the priority sector target of 40 per cent of net bank credit and also on the sub-target of credit to agriculture of 18 per cent. The share of priority sector advances declined from nearly 41 per cent in the pre-reform period to 37 per cent or so in 1995-96. The RBI chose to wink at the default and did not even condescend to analyse, in its scholarly publications, the causes of such default. In fact the share of rural branches in total bank credit declined from more than 15 per cent in the second half of the 1980s to around 11 per cent in 1996. The credit-deposit ratio of rural branches – which had risen above the prescribed level of 60 per cent – declined to less than 48 per cent in 1996. These are unmistakable indicators of a sizeable decline in the total resources flowing to the rural sector. RBI recovered from its amnesia only after the United Front government articulated its concern for agricultural and rural development and has subsequently started making appropriate noises.

The concessional element in the lending rates was totally eliminated as part of the reform prices. For instance, even a small borrower has to bear an interest rate of 12.5 per cent against 10 per cent in the pre-reform phase. The principle of cross-subsidisation of interest rates which was the bedrock of the Indian interest rate policy thus suddenly became unfashionable. There are at least three reasons why the element of concessionality is crucial to Indian economic growth. First, there is a wide range of micro-businesses and tiny enterprises operating under low-level equilibrium: in such cases a 1 or 2 per cent rise in interest rate may convert a viable business into a non-viable business. Second, as the east Asian experience, which we will discuss shortly, demonstrates, selective subsidisation makes credit policy an instrument of economic development. Third, cross-subsidisation, as I G Patel has forcefully pointed out,⁴ is one of the essential ingredients of a civilised society. One need not therefore shun an interest rate structure with a built-in element of subsidisation, if this approach is going to be growth-enhancing.

The credit policy pursued during 1991-96 lacked a medium-term perspective. Faster agricultural growth, expansion of non-farm

activities in the rural sector, fuller exploitation of the potential of the hi-tech segments – these are the essential ingredients of any meaningful policy aimed at ensuring food security, generating employment and alleviating poverty. The fact that foodgrains stocks with the public sector had reached an embarrassingly high level of 35 million tonnes in 1995 appears to have lulled us into a sense of complacency. If a holistic view of food security is taken, the prospects of agricultural growth appear grim. In fact M S Swaminathan quotes Lester Brown and Hal Kane who predict that at the current rate of population growth and environmental degradation, coupled with an improvement in the consumption capacity of the poor, India will have to import annually over 40 million tonnes of foodgrains by the year 2030.⁵ Admittedly, there is an element of exaggeration in such predictions but the underlying thrust cannot be brushed aside. In fact the task of accelerating agricultural growth in the coming years is far more daunting than what it was during the green revolution period. In sharp contrast to the green revolution strategy which achieved a breakthrough in the production of a couple of crops by concentrating on the fertile irrigated areas and on the relatively better-off farmers, the new strategy should usher in growth which would have to be pervasive, involving use of degraded land, dryland farming, optimal use of water and common property resources. At the same time, it is recognised that the poverty reduction potential in the agricultural sector is far from exhausted. The point is all these activities would need to be supported by a well-structured rural credit system.

At present the rural credit system is in a shambles. It is suffering from 'functional fatigue' which is exacerbated by the new banking culture, nurtured by financial sector reforms. Almost all institutions constituting the formal segment of the rural credit system – rural branches of commercial banks, co-operative credit institutions, and Regional Rural Banks (RRBs) – suffer from serious infirmities. These institutions are characterised by large loan defaults and a virtual erosion of repayment ethics. The growth of overdues is disturbing. This has hampered the recycling of resources and affected the very viability of the institutions. For instance, a majority of the 196 RRBs are deemed non-viable: in 1994-95 only 32 RRBs recorded profits, while the remaining 164 posted a loss aggregating Rs 420 crore. In the case of co-operatives, of the 368 District Central Co-operative Banks (DCCBs), only about 170 were generating profits. The overdues constituted 33 per cent of demand. Similarly, of the total 90,783 primary agricultural credit societies (PACS), only about 60 per cent were viable: overdues constituted about 38 per cent. One would have thought that under such circumstances,

overhauling the rural credit system would claim a pre-eminent position on the agenda of the financial sector reforms. On the contrary, this is put on the back-burner. This is because the Washington model does not have any blueprint for reform of the rural credit delivery system, as it has the 'Basle Norms' for the banking system! Restructuring a dozen RRBs or signing Memoranda of Understanding (MOU) is only an apology for action. Indeed in the Indian context, there cannot be any meaningful financial sector reforms without rebuilding a rural financial system supportive of agriculture and other rural economic activities.

Perhaps the most disturbing feature of the second phase of evolution is the new banking culture bred by reforms. Even public sector banks, which were committed to support priority sectors, suddenly acquired a nose for a 'quick kill'.⁶ Today banks have enough resources to provide sizeable bridge loans to enterprises like the M S Shoes, but they have no money to finance the production of sugar in Maharashtra. Again, banks would prefer to invest in zero-risk and high-yielding government securities far in excess of the statutory liquidity requirements (SLR) to lending for productive purposes. Here again, the blame should rest squarely on faulty interest rate policy rather than on the bankers.⁷ It is such a radical change in the mind-set of Indian bankers, particularly public sector bankers, which would pose a serious threat to the pursuit of growth-enhancing credit policies in the third phase.

MARKET FAILURES

At this stage, the rationale for intervention in the financial system can be summed up briefly. First, governments or central banks intervene to correct market failures. Second, intervention is also necessary when the economy shows a significant discrepancy between private and social benefits. In a market-driven financial system, there is little incentive for private financial institutions to lend to small borrowers, micro-enterprises, small firms and farms. On the other hand, the social benefits of lending to these borrowers are enormous. This situation calls for intervention.

A couple of concrete cases of market failures may be briefly discussed. First, the call money market. During the early months of 1992 there was the Harshad Mehta induced boom in the capital market and this, in turn, had its impact on the call money market. The call money rates soared to 75 or even 100 per cent. The apprehension then was that resources from the call money market were being diverted to artificially support the engineered boom in the capital market. The point is that when the rates soar to 75 or 100 per cent, the call money market simply does not reflect temporary imbalances in the supply-demand position of short-term funds in the inter-bank market. One has to look

for Stiglitz's 'charlatans' who are running amok in the market!

Financial markets are not like the conventional auction markets that simply auction off a unit to the highest bidder. The highest bidder, that is the one who promises to pay the highest interest rate, may have no intention of paying back the loan. To quote Stiglitz again, the distortions, of the nature mentioned above, manifest themselves because of the "infinite number of charlatans out there willing to take other people's money and use it for themselves or on projects that are not good".⁸ Second, such market failures are perhaps more conspicuous in the case of the capital market, the Harshad Mehta phenomenon being a recent case. Liberalisation has brought in its wake several distortions. As one market analyst puts it bluntly: "Liberalisation of the capital market has made things very attractive definitely for issuers, if not for the investors. With the flimsiest idea of a project virtually anyone can tap the market for funds. With absolutely no post-issue monitoring, most get away with it too. Taking the lead and flooding the market are shady finance companies, with dubious promoters, ridiculous plans and even more doubtful projects." There may be an element of exaggeration in the above statement but the basic point remains valid. During the capital market boom, a number of fly-by-night companies tapped the equity market successfully and vanished into thin air later. The Securities and Exchange Board of India (SEBI) has now woken up to the situation and is likely to initiate investigations into the growing number of such vanishing companies. In the liberalised market SEBI is not responsible for vetting the projects, but the concerned merchant bankers are expected to exercise 'due diligence' in managing the issues. There is a mushroom growth of merchant bankers. Yet another analyst puts in plain words the role of merchant bankers: "The SEBI has over 300 registered merchant bankers who have usually played a big role in procuring temporary subscription, falsifying project details and accounts and cheating investors... How does it explain the fact that the primary market is dead because investors are tired of being duped with fraudulent and expensive public issues, but no merchant bank is in the dock?"¹⁰ So much for the role of the capital market in the mobilisation of savings and its allocative efficiency.

The exaggerated importance attached to the development of the capital market, the various props given to artificially boost the capital market are all evidence of our misplaced enthusiasm to imitate the Washington model.

EAST ASIAN MODEL

At this stage, one could legitimately pose the question: were there any alternatives to the Washington model? Yes, If only the

Indian monetary authorities had sought to take a leaf out of the east Asian experience the results would have been far better. This experience is more appropriate to the Indian circumstances. The economies of east Asia, beginning with Japan and followed by the four tigers – Korea, Hong Kong, Singapore and Taiwan – and then by Malaysia, Indonesia and Thailand, have grown so rapidly during the past quarter century that their growth has been called the 'East Asian Miracle'. Public policies affecting the financial system were among the more important factors contributing to their rapid growth. East Asian governments intervened intensively in the operations of their financial systems. They helped create financial markets and institutions, regulated them heavily, and directed credit to some industries and away from others. These interventions were designed to mobilise savings and to affect the allocation of investment. The east Asian economies had high national savings rates achieved largely by voluntary actions, and they were able to invest their savings in ways that yielded high returns. Government interventions in the financial markets that promoted savings and the efficient allocation of capital were central to these successes. Many of the specific institutions, programmes, and practices can easily be replicated. This experience is now well documented.¹¹

Two or three aspects of the governments' or the central banks' intervention may be briefly touched upon. First, about development banks. Most countries in east Asia established long-term credit banks and specialised institutions providing credit for agriculture, small firms and housing. Development banks lent substantial funds on a long-term basis in Indonesia, Japan, Korea and Taiwan. For instance, the Korean Development Bank accounted for about a third of all loans and guarantees in the 1970s. Taiwan's Bank of Communications accounts for about half the assets of the banking system. The Japan Development Bank accounted for 45 per cent of equipment lending in the early 1950s. In addition, most east Asian governments created specialised banks in areas where private lending has been viewed as inadequate, most notably in agriculture and small-scale enterprises. For example, Thailand's agricultural development bank caters to small farmers who do not have access to commercial bank lending. The bank has reached 80 per cent of potential agricultural borrowers. East Asian governments also created financial institutions for housing finance, Singapore being the most prominent example. Policymakers in Singapore believed that providing subsidised mass housing was essential for maintaining social stability.

The rationale for creating development banks in preference to developing the capital markets is clear. First, governments can

influence the flow of credit to priority areas or sectors. Second, development banks are better placed to monitor borrowers closely; such close supervision might also ensure the successful implementation of the projects.

The Indian scenario provides a sharp contrast. The two development banks, IDBI for industry and NABARD for agricultural and rural development, both of which have a very good track record, have been crippled as a result of financial sector reforms. RBI has stopped its support, since 1992-93, to these two banks through its long-term operations (LTO) funds. These funds, generated out of the profits of RBI, used to provide, on a continuing basis, resources of a sizeable magnitude, at nominal cost, to these development banks. On the basis of these funds, the two institutions were in turn able to extend medium-term and long-term assistance to industries and agriculture, at concessional rates of interest. Under the reformed regime, RBI is channelling the bulk of its profits to the government of India to bridge its budgetary deficit. As we know, the budgetary deficit is rising higher and higher! One immediate consequence of this is that the two development banks are today not only faced with scarcity of resources but also with high cost of funds. The institutions themselves are borrowing from the market at unsustainably high rates of interest. Hence their lending rates have soared to usurious levels. This is happening at a time when the capital market is in the doldrums. As if this were not enough, S S Tarapore, then deputy governor of the RBI, issued the following warning to industry: "First, industry needs to be clear that the days of the development financial institutions are over in that financial institutions would no longer be in a position to provide credit at sub-market rates of interest".¹² Here is the strange case of authorities, both the government of India and RBI, going out of the way to provide artificial props to boost the capital market, which even in the developed countries is not a major source of capital formation in the corporate sector; and at the same time, crippling two development banks which were doing an excellent job in promoting agricultural and industrial growth. What a travesty of reforms! This is one more concrete case of credit policy turning growth-compressing as a result of blindly following the Washington model! One only hopes that the United Front government would ensure the restoration of LTO funds to both IDBI and NABARD as early as possible.

Secondly, all of these countries directed credit to specific sectors and firms through public as well as private banks. In Indonesia, Malaysia, Singapore and Thailand banks are privately owned. In these countries governments/central banks have broadly guided credit allocation through regulation and moral suasion. South Korea and Taiwan tightly controlled the allocation of credit by

public commercial banks. Each of these countries made attempts to direct credit to priority sectors, though the definition of the priority sectors varied from country to country. One common sector was exports; many of them gave automatic access to credit. Housing was a priority area in Singapore and Hong Kong, while agriculture and small- and medium-size enterprises were targeted sectors in Indonesia, Malaysia and Thailand. Again, Taiwan has recently targeted technological development. Japan and Korea have used credit as a tool of industrial planning to promote at various points of time ship-building and chemical and automobile industries. Negatively, they discouraged lending for consumer credit at the initial stages.

Thirdly, subsidised credit was not uncommon, in some cases the subsidy being sizeable. For instance, in Korea the subsidy for preferential credit was large during the 1970s. Subsidy was rather small in Japan. "Recent assessment of directed credit programmes in Japan and Korea provide macro-economic evidence that directed credit programmes in these countries increased investment, promoted new activities and borrowers and were directed at firms with high technological spillover".¹¹

SHARED GROWTH

Our approach to growth, as reflected in the reform package, itself appears to be flawed because the principle of shared growth does not form an ingredient of the package. The east Asian experience demonstrates that rapid growth is sustainable in the long run only if it is equitable. These high performing economies in east Asia are the only economies which have had high growth rates and declining inequality. The proportion of the population living in absolute poverty dropped dramatically in these economies from 58 per cent in 1960 to some 17 per cent in 1990. The decline was much steeper in some of these countries. The corresponding percentage in the case of India were from 54 to 43. As a result of this rapid and shared growth in these east Asian economies, human welfare has improved dramatically. Such sharing of growth in fact provides a sustainable base for long-term growth. In the case of India, although no hard data are available, the general impression seems to be that during the reform phase 1991-96, the benefits of growth, such as has taken place, have accrued to a small section of the population. Unemployment and underemployment are on the increase and the extent of poverty has perhaps not declined.

The problem of approach to growth is far more serious in the sense that it has become necessary to re-sensitise the present Indian policy-makers about poverty and unemployment and the need for state and central bank intervention to tackle these issues effectively. If the financial policies

pursued during the 1991-96 phase are any indication, the monetary authorities have sought to wish away poverty. Even the World Bank, that citadel of market philosophy, in a recent report on India, makes the following statement: "The central message of this chapter [on agriculture] is that there is tremendous scope for unleashing the productive potential of agriculture to contribute more fully to overall faster and more equitable economic growth..."¹⁴ (emphasis added). In the 1950s Indian planners made a seminal contribution to development economics by stressing the distribution aspects of growth. It is an irony of economic history that we have today to invoke the World Bank's exhortations to resensitise contemporary Indian policy-makers about the imperatives of redistribution.

In the present context, two aspects may be underlined. First, one of the primary activities of the government is redistribution; but the budget need not be regarded as the sole instrument of achieving this objective. In fact all arms of macro-economic management can contribute to the process of redistribution; and the financial system can play an important role in this task. Second, the east Asian experience has clearly shown that directed and subsidised credit could become an important ingredient of the policy-mix designed to facilitate faster growth and redistribution. Fortunately, the United Front government's initiatives do give rise to hope that financial policies in the third phase of evolution of the financial system would be re-moulded on these lines.

THE DILEMMA

It is in this sense that the third phase of the evolution of the Indian financial system faces the dilemma of choosing between the two cultures. The culture of the 'quick kill' and insensate profit-making nurtured by reforms in the second phase and a reaffirmation of the culture built up during the first phase, of commitment to pervasive growth with equity, reflected in the extension of support to small borrowers, small-scale industries, small farms and firms, the self-employed and the whole range of activities in the informal sector. If bankers are to revert to the former, this involves much unlearning on the part of bankers, particularly public sector bankers, of the 'skills' acquired during the second phase. It does not also mean a reacquisition of the culture of the first phase with warts and all: the inefficiencies of the first phase need to be eliminated. Use of performance-based criteria in the allocation of credit and application of commercial standards even within the priority sectors should be built into the culture of the first phase. The east Asian experience could provide useful guidance in reformulating financial policies on these lines. Again, there has to be some reordering of priorities in the reforms package, notwithstanding the

stipulation of the Washington model. Rebuilding the rural credit system brooks no delay: it is as important as the application of 'Basle norms' to the banking system or development of the capital and debt markets. It is therefore suggested that a high-power committee be appointed to evolve a blueprint of the new rural credit structure, both in terms of institutions and modalities of credit delivery. The committee should also lay down the ground rules for different players in the system. All this involves activist policies both by the government and the RBI.

Housing Poverty in Third World

R N Sharma

Housing the Urban Poor: Policy and Practice in Developing Countries edited by Brian C Aldrich and Ranvinder S Sandhu; Vistaar Publications, New Delhi, 1995; pp 417, Rs 445 (cloth).

THE book under review is spread in five parts and 19 chapters, and covers 16 countries from the third world. The country case studies are organised in terms of their level on the human development index (HDI) developed by the United Nations Development Programme (UNDP). Life expectancy, literacy and level of income are the three indicators measuring the HDI. Accordingly, Hong Kong, Republic of Korea, Costa Rica and Mexico are ranked at the top (among the third world countries under focus) of the HDI. They are followed by Caribbean, Brazil, Colombia, Cuba, Thailand and China. At the lowest rung are Egypt, Zambia, Tanzania, Ghana, Pakistan and India.

Part I of the book consists of two chapters. In chapter 1, the editors examine at length the problem of housing poverty of the 'developing societies', and then interpret the terms 'slums' and 'squatter settlements' and see how they reflect the 'poverty of housing' in these societies. The terms slums and squatter settlements are considered objectionable by the contributors – used at one point in the development of policy and practical responses to housing poverty as justification for clearance and relocation. Therefore, the term 'housing poverty' is used with the assumption of covering different aspects of habitat. Editors also describe the global process of urbanisation and its impact on third world countries. They review the variations in housing policies and practices. For the editors, the conflicting analysis of squatter settlements (or housing poverty) centres around whether the people in these settlements are part of the problem or part of the solution. They contrast the view of evolution of slums as the consequence of 'over-urbanisation' to that of the poor living in slums and subsidising the formal economy by not requiring large amounts of capital for housing and related services.

Chapter 2 focuses on the role of the World Bank in housing. It looks at recent changes in the World Bank policy in light of the negative consequences that traditional World Bank attempts at long-term macro-economic stabilisation and adjustment policies have had on near-term income and housing. Pugh (the contributor to the chapter) recognises a new political economy model which provides the legislative, institutional and financial framework whereby entrepreneurship in the private sector, in communities, and among individuals can effectively

develop the urban housing sector. It is informed that in the housing sector, the World Bank had participated in the finance of 116 sites and services projects and slum upgradation schemes with its average loan of US \$ 211 million in the period 1972 to 1990 in 55 countries. Perspectives and explanations of housing and poverty are linked to the IMF and World Bank macro-economic reforms in some developing countries. A discussion on the income poverty in developing economies and the role of IMF and World Bank are other highlights of the present paper. By citing examples of some Latin American countries, Pugh reveals that the austerity, stabilisation and adjustment programmes had severe effects upon incomes and poverty, and repercussion effects on (Brazil's) housing system and housing affordability. For him, innovative institutional arrangements would be needed because the poor have intermittent incomes and no collateral assets in land and property to secure their loan finance in the formal sector. The innovations would include a link institution between NGOs and formal financial institutions, to raise finance from these institutions and to ensure that the poor repay their loans. It is pointed out that, in fact, in 1991, UNCHS (Habitat) and the UNDP jointly launched an Asian-based project to develop market based housing financial systems which would be responsive to low-income groups.

The author identifies three main phases in the evolution of the World Bank housing policy. The first phase concentrated on the affordability-cost recovery-replicability. Its essential political economy was 'neoliberalism' which placed its emphasis on individualism, free markets, and user pay principles. The second phase theory and practice of low income housing involved appreciation of the fact that housing was closely connected to macro-economic conditions and the need to create and use housing credit institutions. The third phase theory and practice of housing was developed in the years 1986 and 1992, with its thrust on the growth and development of the entire housing sector in its urban and national context. Under it, 'urban management programme' became the keyword with the aim of improving performance in developing countries in land management, municipal finance, infrastructure services, the environment, and building up the capacity of urban management institutions.

The part II includes case studies on four countries: Hong Kong, South Korea, Costa Rica and Mexico. Housing poverty in Hong Kong is described by Alan Smart in Chapter 3. Hong Kong has managed to rehouse 45 per cent of its population in public housing since 1945. The government used its extension controls to clear squatters, sell a major portion of the land to the private sector, and use the money thus obtained to rehouse the squatters. The boom in prices of land and housing is phenomenal. It is therefore not surprising that Hong Kong government attempts to maximise the production of land for the private sector. Unlike many other countries, Hong Kong has not yet regularised any squatter settlements. They remain in a limbo of illegality combined with toleration until the land is scheduled for development. Thus, according to Smart, the government policies are themselves to a large extent responsible for the poor conditions of housing in Hong Kong's squatter areas.

Jaesoon Cho and Jeonghee Park describe the South Korean situation in Chapter 4. Similar to many developing countries, the approach of government of South Korea to the slum and squatter areas varies from demolition and renewal to self-help upgrading, rehabilitation and renewal, and present urban housing renewal, and rehabilitation. All of them have only been partially effective. Like Hong Kong, rapid increases in rent and housing prices in Seoul have produced a new phenomenon of social pathology. A squatter settlement contains whole lives of the squatters.

Costa Rica, described in Chapter 5, is a special housing case. It received the 1987 World Habitat Award for a national housing programme which surpassed its housing target, integrated low-income families into the system and developed a family bond system of mortgages which successfully brought housing to members of the society with the lowest incomes. The innovative National Bamboo Project is described as a successful programme within a policy framework aimed at sustainable development.

Mexico's housing poverty is seen in relation to the process of uneven and rapid urbanisation of the country. The consequences of the 'economies of austerity' for housing are well discussed by Pezzoli. He observes that in Mexico city, 47 per cent of the families lack the income necessary to purchase or rent a dwelling unit available in the formal real estate sector. Like Mumbai, it is estimated that 1,000 people migrate to Mexico city every day. The result is that, by 1975, over 50 per cent of the metropolitan area's population lived in one or another variety of degraded houses (colonia popular). The author describes some popular urban movements centred around the issue of land and housing. He cites the observations that

one of the most significant characteristics of recent social movements is the depth of their critique, and the extent to which an alternative approach to development is sought. The critique stems from a view that the crisis in Mexico and throughout Latin America is not only economic and even less only financial – it is a crisis in the mode of development with far reaching ecological, as well as social, ideological, and political dimensions. Thus, the urban housing crisis goes beyond issues of land allocation and management into broader issues concerning livelihood opportunities, developmental sustainability and ecological balance. One can find resemblance in the situation of Latin American countries to that of India.

Case studies on Caribbean, Brazil, Colombia, Cuba, Thailand and China form Part III of the volume. The case studies show that an extensive effort has been made by these countries to deal with housing poverty. The chapter on China is considered as an exception, with the observation that it has concentrated more on improving income, health or education than housing. The paper on Caribbean islands shows a major intervention by the World Bank or USAID in tackling the housing poverty. It brings out the fact that adequate local community resources are available to initiate and organise low-income housing projects. However, as in other third world countries, political institutions lack the motivation and will power to achieve any significant success in the area. The case study on Sao Paulo (Brazil) describes the struggle for urban space becoming intense day-by-day mainly due to the land and housing turning commodities in the market for profiteering and speculation. Similar observations are made on Colombian housing problems: rapid urbanisation, low incomes and a national housing policy indifferent to the needs of low income urban residents.

The case study on Cuba concludes by stating "that the Cuban state has developed impressively imaginative and flexible housing strategies" through measures like overcoming poverty, elimination of land and property speculation, and removal of the insecurity of tenure. With the collapse of communist power in the USSR and eastern European countries, the resources of Cuba are adversely affected and are bound to halt the struggle against housing poverty.

The chapter on Thailand mainly focuses on Bangkok. Housing poverty in the city is considered either the most backward or the most advanced, depending on one's perspective. It is observed that the population of 30 randomly selected slums in Bangkok have a higher income than the population of the Bangkok metropolitan administration as a whole. In spite of this, against the operating of free-market situation in various sectors including the housing sector, the government could not succeed in providing formal housing (with minimum costs) to a majority of the slum dwellers. In the late 1980s,

private developers moved into the low-cost housing market, producing large numbers of complete land-and-housing units in the outlying suburbs. Although unaffordable for the lowest income groups, the houses made an important contribution to the housing stock in Bangkok. Whereas in the 1970s and early 1980s, the World Bank tried rather unsuccessfully to introduce slum and slum settlement regularisation and upgrading programmes in the city, the success of the private sector to produce low-cost housing has made Bangkok the primary example for the effectiveness of recommendations by the World Bank and the USAID to deregulate the housing market.

The case study on China is seen (by the editors) as an important part of global housing poverty because it contains such a large proportion of the population on the planet. In communist-ruled China, Stalinist type solutions controlling the movement of people; emptying out the cities, are identified as mainly responsible for deterioration of much of the urban housing stock in the major cities, and the creation of housing poverty. The emphasis upon production at the expense of (housing) consumption added to the housing poverty. The 1978-92 period is considered to be one of contradictions: between the socialist ideals of elimination of socio-economic disparities and the economic goals for rapid development. Consequently, the recent development of a dualistic urban structure in the supposedly prosperous cities of China, according to the author, will most likely shape settlement patterns in urban areas in the future.

Part IV on housing under 'low levels of human development' includes case studies from Egypt, Zambia, Tanzania, Ghana, Pakistan, and the last of all, India. All these countries face common problems; overall low levels of development, high population growth, en masse migration of the rural poor towards a few growth oriented urban centres, vast inequalities in living standards of people due to rising socio-economic disparities and inefficient and corrupt bureaucracy and political leadership. Such a situation has led to a dual housing market in large cities – a formal costly 'free housing market' catering to the needs of less than a half of the urban population and an informal 'affordable' market serving the lower strata of population. In such a situation, populist measures are adopted by governments of these countries. Sites-and-services, upgrading, newly built houses – through national or international funds – are used in tackling the housing poverty. Simultaneously, evictions, demolitions and resettlements have their own place in the urban renewal process. The variations are there: like Tanzania attempting to solve the problems of land and housing in a socialist mode; or land tenure under the control of traditional family and tribal relationships still influencing the provision of urban housing in Ghana.

Part V presents the concluding chapter by Choguill. He observes that the planners and technicians have to have the skills of a community organiser if rehousing projects are to succeed. Likewise, NGOs have to know basics of technology and finance for their effective involvement in housing projects. This is considered necessary as the 'top-down imposed bureaucratic and technically proficient solutions have not saved the day. Now the emphasis is on the recognition of the key role of the local participants in the process: local governments as enablers, local neighbourhood residents as facilitators, and local entrepreneurs as providers of cost-efficient solutions.

The editors need to be complimented on compiling case studies on housing poverty from a large number of third world countries. Though most of the papers are well-written, the substantial contributions are by the editors ('Global Context of Housing Poverty') Cedric Pugh ('The Role of World Bank in Housing') and C L Choguill ('The Future of Planned Urban Development in the third world').

A couple of inadequacies need to be pointed out. While discussing the 'alternative models of urbanisation and housing', the editors whisk away the Marxist approach to housing, by stating that the socialist countries treat housing production as a non-productive capital expenditure. But the reflections of Marxist thinkers on 'struggle for urban space and its context, in political economy of city' cannot be overlooked. Thus, though the writings of thinkers like Manuel Castells, David Harvey or Peter Saunders may not be central to the theme of housing, they have made useful contributions to the theory of urban space and its relationship to social services like housing.

In a similar way, those who question the role of international organisations like World Bank or IMF in interfering into political and economic affairs of the poor countries, may find the book irksome as it is overloaded with the World Bank approach to the poverty of housing and description of its projects in several countries.

The paper on India by Sridharan is rather disappointing as it is more confined to Delhi city and largely based on official reports.

Interestingly enough, though the contributors unmistakably identify reasons after reasons for growing housing crisis in largely populated cities, in no way a definite solution emerges to it. If the 'socialist' approach is responsible for inadequate housing construction and decaying of the existing stock, the 'free market' approach seeks ever-expansive solutions like 'need of strengthening the financial institutions' or 'need of efficient governance of housing projects and enabling the poor to secure land tenural rights'. One may therefore infer that, in future, the housing poverty will further intensify.

Overall, the edited volume is an outcome of well-researched work and is a significant contribution to the literature on housing.

Dalit Christians in India

S M Michael

Dalits in India: Religion as a Source of Bondage or Liberation with Special Reference to Christians by James Massey; Manohar, New Delhi, 1995; pp 206, Rs 300.

DALIT Christians are those converted to Christianity from the scheduled castes, but excluded from official list of scheduled castes, made by the Government of India (GOI). The term, Christian dalits, was adopted in preference to the nomenclature, Christians of scheduled caste origin (CSCOs) or harijan Christians, to emphasise the dignity and humanity of dalits.

There are about 16 million dalit Christians in the country and they form over 60 per cent of the total Christian population of 25 million. The Christian dalits increasingly share a general sense of oppression/discrimination in the church and society, on account of their low-caste origin. Arising out of this double discrimination they suffer multiple alienations: (i) from the rest of the dalits, (ii) from upper caste Christians, (iii) from the upper castes in society, (iv) from the government agencies, and (v) from cultural conflicts leading to confusion in their self-identity (Christian or scheduled caste).

It is a fact that casteism exists in the church in India despite of their clear break with Hinduism and the caste system. The oppressive past of the dalits continues to haunt them in their new faith. Caste identity continues to override religious identity. In 1929, a delegation of scheduled caste Christians stated in a deposition before the Simon Commission, "We remain today what we were before we became Christians - untouchables degraded by the laws of social position in the land, rejected by caste Christians, despised by caste Hindus, and excluded by our own Hindu depressed class brethren".

Even today, in predominantly Christian villages, the dalit colony is distinct and separate from the upper caste settlements, there are separate church buildings, hearses and cemeteries for them.

The economic condition of dalit Christians are also deplorable. Data on educational mobility and occupational advancement of Protestants in Madras reveal that the dalits are largely left out in the cold. Material from Andhra Pradesh, Kerala and Karnataka also shows that the dalits have not improved their economic position substantially with conversion.

More seriously, there are several forms of social discrimination against dalit Christians.

In Tamil Nadu, they are residentially segregated from the higher castes. In Kerala, they are largely landless labourers, and work for Syrian Christians and other landed upper castes. There is no question of inter-dining or inter-marriage between the dalits and the Syrian Christians.

A study undertaken by the Jesuits in Tamil Nadu reveals that 79.6 per cent of the dalit Christians are landless, with their average annual income put at Rs 903; 54 per cent live under single layer thatched roofs. In the rainy season the houses get flooded, and no one can sleep during the night. The illiteracy rate is 65 per cent. Nearly 35 per cent of households manage with one set of clothes. Though dalit Christians constitute 70 per cent of the total Catholics in Tamil Nadu, there is only one dalit bishop and a mere 3.8 per cent of the priests are dalits.

Though a minority, Christians provide over 20 per cent of all facilities in primary education, and in the cases of other educational, health and community welfare services, provide facilities far in excess of their numbers. The evidence shows, however, that the church has clearly failed to give to the dalits the full advantage of its educational facilities. The opportunities made available by it have disproportionately benefited upper caste converts, and the dalits have been barely touched.

Whether the church can remain Christian while accommodating the caste system, is open to question. But the fact is that Christianity has not been entirely successful in obliterating the caste system among the Christians in India. Though the existing caste consciousness is unfortunate, it is hardly surprising. The caste system is so deeply ingrained in India that it has been able to absorb most religions like Buddhism, Sikhism, Islam and Christianity which are based on equality.

The caste system is a socio-cultural system based on a hierarchical view of society. Though it is supported by economic and political factors, it is primarily a socio-cultural system that depends on how one looks at others in terms of their work and at the order of society based on the hierarchical division of labour, determined by birth and legitimised by religious theory and practice. While Christianity may not

legitimise the system in terms of its religious faith, it has certainly admitted it in social and religious practice. The Christian community can never be a witness to a fellowship of brothers and sisters if it does not abolish the caste system from within its ranks. But unfortunately, the church cannot really abolish the caste system - especially its dalit component - from its own social body, if it does not work to abolish it from the whole society. As Ambedkar points out India requires a cultural revolution to root out caste discrimination.

Meanwhile the dalits converted to Christianity have lost the constitutional safeguards meant for the scheduled castes and scheduled tribes. At the time of independence, special provisions for the SC/ST were included in the Constitution. These embraced the reservation of seats in legislatures, educational institutions and public sector employment. By a presidential order it was decreed in 1950 that 'no person who professes a religion different from Hinduism shall be deemed to be a member of a Scheduled Caste'.

In 1956 the Sikh religion was included with Hinduism as part of this order. The subject of extending reservations to the SCs of other religious groups was discussed during the debate on conversions to Buddhism in 1961. The government's position was that the untouchables from non-Hindu communities could not be extended benefits because the other religions did not recognise the existence of caste and to accept their claims would be to introduce casteism into Buddhism, Christianity and Islam. Nevertheless, in the face of continued protests, the government extended reservations to neo-Buddhists in 1990.

In spite of the dalit Christians' demand to be included in the scheduled caste list of the presidential order of 1950, their plea has not been heeded. In fact, a dalit Christian today is thrice discriminated against - by the state, the church and by the non-dalit Christians.

A few examples will illustrate the above facts: it was alleged that on November 12, 1976 at about 6 pm in a sub-treasury office in Vellore Fort Thiru K V Srinivasan insulted V S Lourdu, a member of the scheduled caste, on the ground of untouchability by calling him a "pariah". When the matter was taken to the court, the judge dismissed the case because the aggrieved party was a dalit Christian. This judgment shows that it is not against the law to offend a Christian dalit by practising untouchability against him/her. This means, if ever any one is accused of violating the protection of civil rights act against a Christian dalit, he need not worry.

Soosai (a Tamil synonym for Joseph), a dalit Christian, is a cobbler by profession. He had nine children, of whom seven died of malnutrition and lack of medical care. He lives on the pavement of Madras doing his daily job as a cobbler. He spreads his wares on the sidewalk of the street, since he does not have a roofed place for his profession. A few years ago he was enumerated for receiving government assistance, a bunk to keep his kit and a sewing machine to stitch leather goods. This assistance is given to all members of the scheduled caste engaged in the profession. When all the cobblers working on Kodamhakkam High Road in Madras were called to receive the assistance, Soosai also went with them. Everybody was given the assistance except Soosai. Soosai was informed by the government officials that he was not entitled to the benefits and privileges extended to other scheduled castes people because he happened to be a Christian. This is a clear case of discrimination against Christians based on religion, though our Constitution does not permit discrimination on grounds of religion. When the matter was taken to the Supreme Court, the judgment said (September 30, 1985): "It is not sufficient to show that the same caste continues after conversion. It is necessary to establish further that the disabilities and handicaps suffered from a caste membership in the social order of its origin - Hinduism - continue in their oppressive severity in the new environment of a different religious community".

The Govt has studied this matter through its several committees. For example: the Kumara Pillai committee report submitted to the Kerala government in 1965 states: "We are convinced that in practice converts (to Christianity) from scheduled castes are treated as socially backward". The Santhanam committee report of 1970 says: "The same spirit of renaissance which animate the Indian SCs has not spread to the Christian sections and due to the absence of employment opportunities similar to those reserved for SCs, there was no temptation for the converts to go into higher education". And the Chidambaram report in 1975 admitted "that casteism is practised widely among the members of the Christian fold as judged by the characteristic of caste system and going by the economic status of the harijan Christians. It is evident that they are a poverty-stricken lot". The Mandal commission report of 1980 affirms, "there is no doubt that social and educational backwardness among non-Hindu communities is more or less of the same order as among Hindu communities. Thus, both from within and without, caste

amongst non-Hindu communities receive continuous sustenance and stimulus".

In a judgment dated December 14, 1993, Justice J Kanakaraj at Madras high court, says that the plight of dalit Christians is none the better after conversion. It is a 'popular myth' that when a person converts, he is accepted and treated as equal to others.

In spite of the above evidences, inclusion of dalit Christians for the reservation benefits as being given to the Hindu, Sikh and Buddhist dalits, is an emotionally charged political issue in India. No political party, left or right, looks seriously at the concept of reservation for dalit Christians impartially. The Bharatiya Janata Party (BJP) has been consistently opposing the idea, apparently shedding tears for the non-Christian dalits. One reason the BJP is opposing the move is to strengthen its agenda of re-conversion as no Christian dalit would return to his original non-Christian identity if he gets reservation benefits as a Christian. With the mounting resentment among the dalit Christians against the church, the Hindu revivalists think re-conversion is easier in the Christian community than in the Muslim community. Not very long ago a number of dalit Christians in Tamil Nadu joined the Arya Samaj for scheduled caste status (*Indian Express*, March 3, 1994).

Other political parties calculate the political advantage or disadvantage in extending reservation to the dalit Christians. While the controversy rages, the plight of the dalit Christians continues.

A dalit is a dalit, whether Christian or not. They are basically toilers, landless peasants, rural wage labourers and workers in the tertiary sector where working conditions border on the medieval nightmare. They are contractual labourers across the length and breadth of the country and those who oppress them do not differentiate between Christian dalits and non-Christian dalits. If casteism is a socio-economic phenomenon, and caste is the criterion for reservation, why deprive a certain section of the society of the benefits on the basis of creed? The dalit Christians are socially, economically and religiously discriminated. Is it just and in accordance with the spirit of the constitution, which is based on secularism and justice, to deny to some, what others enjoy, only on the grounds of one's creed?

The dalit Christians' point of view is that the duty of the secular state is to address the issue, of its declared policy of not discriminating against citizens on the basis of religion. The book under review is a plea in this direction.

The 'Problem' of the Urban Poor Policy and Discourse of Local Administration

A Study in Uttar Pradesh in the Interwar Period

Nandini Gooptu

Based on a case study of four of the largest towns of Uttar Pradesh, this paper discusses the measures of the local authorities to reduce urban overcrowding, to improve sanitary and public health conditions and to implement town-planning schemes, all of which were undertaken in the interwar period on a far more extensive scale than ever before. It demonstrates that these policies contributed significantly to the 'creation' of the 'problem' of the urban poor, both materially by intensifying their scarcity of housing or impairing their sources of livelihood and discursively by categorising them as a distinct social group defined by their undesirable habits and practices.

I

IN the years between the world wars, the large urban centres of Uttar Pradesh witnessed unprecedented migration and demographic expansion. The rapid growth of population in the 1920s and the consequent pressures on economic opportunities and on land in the Uttar Pradesh countryside, followed by the agrarian depression of the early 1930s, eroded the sources of livelihood of many rural people. This stimulated the migration of rural labourers and poorer cultivators to the larger towns in search of employment.¹ The rural poor flocked to the towns and found work as manual labourers, hawkers and vendors. The process of migration brought into being a far larger underclass of the poor in the towns, swelling the ranks of the labourers and petty traders who were already there. The growing presence of a floating population of poverty-stricken job seekers and the emergence of the labouring poor as a significant social force in the towns generated grave concern amongst the urban propertied classes. The latter perceived the poor not only as a potential source of urban disorder and crime, but increasingly also as the chief impediment to orderly and clean urban development and as a threat to their own health and well-being. This in turn precipitated major changes in the policies of the urban local bodies, which were manned by municipal councillors, elected by the propertied rate-payers or nominated by the government.² The urban local authorities, representing the attitudes of their constituency of propertied classes, identified the poor as the main perpetrators of growing urban overcrowding and insanitary conditions. These attitudes were reflected in town planning schemes, in measures to improve public health conditions and in drives to clear congested areas, all of which were undertaken by the local

authorities on a far more extensive scale than ever before, from the 1920s onwards. Hitherto unprecedented initiatives were taken to reorder the patterns of land-use, settlement and economic activities in the towns.

The impact of this on the poor was twofold. First, the extensive town improvement policies served only to accentuate the scarcity of housing for the poor, often with a deterioration in their living and health conditions. This was, however, not simply because the poor were the targets of measures to reduce urban overcrowding, but also because local policies reflected the interests of the rate-paying electorate and, therefore, sought to meet the escalating demands for urban land and housing primarily of the middle classes and commercial property developers. There were of course some efforts to provide housing for the poor, but these were woefully inadequate. Local policies in the 1920s and 1930s also entailed greater intervention to regulate and control the economic activities of some sections of the poor, for they were considered to be dirty or insanitary not only in their residential habitats but also in their working practices. Such measures often seriously restricted and limited employment opportunities for the poor and impaired their sources of livelihood. Second, the urban improvement programmes were accompanied by a more and more overt discourse of local administration which characterised the poor as the main source of filth and squalor. As in any discourse, in this one too there were various strands: whilst some were concerned to segregate the poor and remove them from the residential and commercial areas of the propertied or the middle classes with a view to making their own environment more hygienic and less crowded, others were more given to the benevolent aim of alleviating the problems of health and housing of the poor. However, both these tendencies harboured similar

negative stereotypes about the character and habits of the poor as the harbingers of dirt and disease. Urban local policy and its underlying attitudes towards the poor in the interwar period thus contributed significantly to the 'creation' of the 'problem' of the urban poor, both materially by aggravating their scarcity of housing or intervening in their economic activities, and discursively by categorising them as a distinct social group defined by their undesirable habits and practices.

The history of urban local administration in British India and its role in shaping the relations both between the colonial state and the indigenous elites and amongst the latter, as well as its impact on transforming the physical appearance of and social relations in the towns, has attracted the attention of many scholars.³ In comparison, the implications of local administration for the poor have been much less systematically explored, except in the specific case of measures relating to the control of such diseases as the plague or cholera.⁴ Yet the twists and turns in local administration extensively affected not only those who had access to the corridors of power of local institutions, either as members or as rate-paying electors, but also those who had little directly to do with the politics of local bodies but who were the recipients and objects of the policies. This paper explores how the predicament of the poor in the towns was worsened by human agency and administrative decision-making in the course of public health improvement and town planning projects in the interwar period. The paper also analyses the nature and extent to which the diverse interests of the propertied classes were reflected in local policies and assesses their implications for the poor. Finally, the paper seeks to illuminate the ways in which the poor were characterised in local policy discourse. This study is based

on four of the largest towns of Uttar Pradesh (UP): Kanpur, Lucknow, Allahabad and Benares

II

The characterisation of the poor as the breeders of disease as a guiding principle of local policies was not entirely new in the 1920s and 1930s. In the 1890s, when the plague hit many Indian towns and the notion prevailed that plague was a disease of filth and squalor, there emerged widespread concern among British officials about those whom they singled out as the main inhabitants of insanitary and overcrowded areas – the poorer sections in the towns. These views were however more prevalent in the administrative circles of such presidency towns as Bombay and Calcutta, which were not only worst affected by the plague but which already had large labouring populations and working class neighbourhoods in the 19th century due to the presence of major industries. In UP, in contrast, the concern with the poor in municipal administration was much less, except in the industrial centre of Kanpur with its workers in the textile and other mills. However, even in Kanpur vigorous plague control measures had been eschewed and attempts to sanitise the poor had been reined in following an initial burst of zeal in 1900 which provoked riots in the city.⁵ Besides, the plague reached UP later than the presidency towns, by which time the government of India had tempered or abandoned draconian plague control measures in view of the serious disturbances precipitated by such interventions in the 1890s.⁶ In the UP towns, by and large, extensive measures to deal with insanitary conditions or overcrowding and with the poor had remained limited, although not absent, until the first world war,⁷ haunted as the British officials of the municipal boards were by the spectre of the Mutiny and the fear of another uprising in north India. As a consequence of this policy of restraint in UP, discussions about the habits and traits of the poor, and overt or active policy prescriptions concerning them, were also far less prominent in the early decades of the 20th century. All this, however, changed in the 1920s. This was primarily because of the significant expansion in the numbers of the urban labouring poor and the growing perception that they were the cause of worsening overcrowding and insanitary conditions. The change also arose from the fact that the British government largely withdrew its official presence from local institutions after the first world war and further devolved local power to the Indian élites. The latter were less apprehensive of the threat to state power arising from a popular uprising and more concerned to deal

with what they perceived to be a direct threat to their own health and well-being posed by the influx of the poor. From the point of view of British officials, a degree of interventionist local policies could be permitted from the 1920s, as any possible popular discontent could be expected to be directed more towards the local élites, now at the helm of affairs, and less towards the colonial state.

In UP, therefore, the question of town planning and urban improvement gained urgency among the local authorities after first world war. Already during the war, the municipal boards in the major UP towns had commissioned town planning experts to suggest schemes for urban sanitary improvement. Such schemes were outlined in a number of reports on town planning. The report for Lucknow was submitted by Patrick Geddes in 1916, for Allahabad by Stanley Jevons in 1919, and for Kanpur in 1917 by the Kanpur Expansion Committee headed by Henry Ledgard, the chairman of the Upper India Chamber of Commerce, and subsequently by H V Lanchester, the town planner, in 1918. The urban improvement schemes proposed in these reports were far-reaching and entailed the extensive acquisition of land and re-planning of insanitary and congested areas, as well as urban territorial expansion through the reclamation of undeveloped land within and on the periphery of the towns. The execution of such extensive schemes was beyond the administrative power or the financial capacity of the town improvement committees of the municipal boards, which were so far responsible for urban improvement schemes.⁸ Moreover, the government considered it necessary to form separate and independent bodies for town planning, with minimum involvement of British officials, the government being disinclined to be directly engaged in town planning activities for fear of facing popular discontent, which was likely to arise from large-scale intervention in land use and settlement patterns in the towns. Accordingly, to expedite the implementation of town improvement and planning schemes at the end of first world war, the provincial government passed the UP Town Improvement Trusts Act (No VIII) in 1919. Improvement trusts were formed in Lucknow and Kanpur in December 1919 and in Allahabad in 1920. The trusts were to be independent of the municipal boards and would be formed by prominent townspeople, nominated by the government and usually chosen from the commercial communities or professional groups. According to the Trusts Act, the new improvement trusts were to have greater powers than the town improvement committees of the municipal boards with regard to compulsory land acquisition and re-planning of townscapes. The government

also extended initial grants to the trusts in order to finance their schemes.⁹

The inception of the improvement trusts after first world war inaugurated a new era of urban town planning and sanitary policies in UP. The non-official members of the trusts abandoned the earlier official policy of caution of the municipal boards in implementing measures for sanitary improvement. The trusts had come into existence with town planning as the main thrust of their policy. However, as H V Lanchester, one of the town planners who framed improvement schemes for several UP towns, pointed out, town planning in India "arose out of health measures, dealing with insanitary and overcrowded areas."¹⁰ As a consequence, the acquisition, demolition and clearance of overcrowded and insanitary areas constituted a chief activity of the trusts. With the creation of the institutional authority of the trusts with extended powers, projects for the clearance of insanitary areas began to be implemented on a more systematic and hitherto unprecedented scale in the towns. The main targets of trust schemes for urban improvement were the poorer sections in the towns, who were identified as the perpetrators of 'plague spots'. Indeed the term 'plague spot' developed as a metaphor to signify the undesirable and unhygienic habitat of the poor rather than as the epicentre of the disease itself. The notion that the poor were chiefly responsible for insanitary conditions was now overtly deployed in the clearance drives. This was clearly stated by the town improvement trusts committee in 1929, which reviewed the activities of the various trusts from 1920 and recommended further schemes of town improvement:

A primary duty of the Trusts is the clearing of insanitary and congested areas. It is ordinarily inevitable, therefore, that the process of improvement mainly affects the poorer portion of the population, whose habitations are generally both insanitary and congested.¹¹

Thus, with the establishment of the improvement trusts attempts to deal with the living quarters of the poor gathered momentum and developed in new directions. The main strategy adopted by the trusts was to try to clear overcrowded settlements within the towns, with the aim of transferring and segregating the poor who lived in these areas to the urban outskirts. This policy was clearly enunciated by the various town improvement trusts committees, which considered the activities of the trusts every five years and framed guidelines for the future. The report of the committee of 1929 stated that "the transference of these labourers to places outside the heart of the city is the first step necessary for the relief of the present congested and insanitary condition".¹² The committee of 1935 stressed the need to

continue this policy towards the houses and settlements of the poor, which "occupy the spaces in between the better residential and commercial areas" and which "are regular breeding grounds of disease and are the main factors in the prevailing high rate of infantile mortality". The committee went on to state, "it is proposed to clear them and transfer the greater part of their occupants to sites outside the city".¹¹ Evidently, the most important solution to urban sanitary and health problems was considered to be the removal and segregation of the poor to urban outskirts, in order to keep them away from the "better residential and commercial areas". However, in some quarters, there was also concern about the adverse effects of these policies on the poor, alongside a wider interest in overall improvement of urban sanitary conditions. The annual report of the Allahabad municipal board in 1941-42, for instance, attempted to advocate the cause of the poor and argued for the need to lay out housing areas for the poor by the improvement trust. However, this report too betrayed the view that separate sites for the poor were necessary not simply because they needed housing, but also because they created 'plague spots' in the residential areas of those identified as 'decent people'.

The areas that have been well planned and [where] good schemes [for middle class housing] have come into existence suffer from great insanitary features due to the entrance of poor class men. [who] made the dwellings not what they would otherwise have been... By the time the full scheme comes into play and the houses are occupied by *decent people*, the scheme will be traversed by poor class men... This has led to the growth of *plague spots* even in those areas that are improved. A well conceived scheme for housing of various classes of poor in different parts of the town is long overdue (emphases added).¹⁴

The increasingly keen urgency of the local authorities to isolate the poor was clearly revealed in the course of controversies over the neighbourhood of Khalasi Lines in Kanpur. Mill workers, hawkers and casual labourers lived in hutments in this area, which was located on the periphery of the British civil lines and the bungalow complex of officials of local textile mills and other factories.¹⁵ The inhabitants of Khalasi Lines had been repeatedly complaining to the municipal board of lack of water supply and public latrines in the area.¹⁶ On their failure to persuade the municipality to provide these facilities and lacking public latrines, in 1932 some of them deliberately invaded an intervening vacant plot of land between the Civil Lines bungalows and the Khalasi Lines settlement and began to use it as an outdoor latrine. This caused severe consternation among the bungalow residents, who urged

the chairman of the improvement trust to "stop this nuisance", on the argument that the area was "surrounded on all sides by superior residences".¹⁷ The municipal board then posted policemen in the area to prevent the invasion of the field near the bungalows and ordered them to arrest and prosecute 'offenders'. This led to skirmishes between the Khalasi Lines people and the policemen. Prior to these events, already before 1932, the Khalasi Lines settlement had caused much soul-searching among improvement trust authorities about the "advisability of developing this area [i.e. Khalasi Lines] for workmen's quarters, seeing that opposite there are Civil Lines bungalows".¹⁸ H V Lanchester, the town planner who had framed town improvement schemes for Kanpur, was also reported to have said that "he could not tolerate the continuance of this insanitary hamlet in the midst of the bungalow area".¹⁹ The tensions in the Khalasi Lines in 1932 eventually prompted the trust to adopt an unequivocal decision to remove the hutments from the area.²⁰ The controversy over the settlement of Khalasi Lines is a typical example of the perception of the local authorities that the proximity to the habitations of the poor threatened the public health conditions of 'superior residences', which in turn justified attempts to remove them from the vicinity of the residential areas of the 'decent people'.

Based on the twin aims of clearing urban congestion and protecting the so-called 'superior residences' or 'better residential and commercial areas' from insanitary conditions, the municipal boards and improvement trusts in the interwar period increasingly acquired and demolished overcrowded settlements of the poor and evicted the residents. Obviously the poor could not be forcibly shifted and isolated *en masse*. Attempts were, however, made to clear out many of their residential buildings and slum areas in the central areas of the towns through the 'internal' schemes of the trust and by enforcing municipal sanitary by-laws. Armed with powers to acquire land on a compulsory basis, the trusts immediately after their inception in the early 1920s began to acquire insanitary or congested land extensively. The town improvement trusts committee of 1924 reported that the trusts deliberately acquired large areas of land "as quickly as possible" to avoid "speculation in land and the consequent rise in its price".²¹ The 'kuchcha' or temporary hutments of the poor and their dilapidated, insanitary or overcrowded houses were naturally the first targets of acquisition and demolition. This was also partly because these houses, being either temporary or in conditions of disrepair, required low demolition costs and cheap rates of compensation for acquisition.²² Moreover, the trusts took the view that the

construction of buildings constituted the most valuable use of land and considered the occupation of land by the temporary kuchcha hutments of the poor to be a waste of vital urban land, and such land was usually acquired and the hutments were demolished in preparation for building construction. The town improvement trusts committee of 1929 acknowledged that the "poorer classes of the population in these areas [i.e. scheme areas] come in for the major share of demolition."²³

The schemes for clearing congested and insanitary areas began to displace large numbers of the poor from their existing dwellings. The annual report of the Lucknow improvement trust in 1922 admitted that 'dehousing' was a new but unavoidable problem arising from trust activities.²⁴ The town improvement trusts committees in 1924 and 1929 also confirmed that 'dehousing' was extensive.²⁵ The actual extent of loss of housing is difficult to estimate. Exact figures are available only for one case in Kanpur, which gives an indication of its magnitude. In 1929 a census was taken of those who would be 'dehoused' as a consequence of trust schemes in 27 slums. The census showed that 9,351 people living in 2,400 houses would be dislodged, of whom 3,200 were mill workers, 4,191 general labourers, 376 'ekka-tonga' drivers (drivers of horse-drawn hackney carriages), and the remaining 1,584 were petty shopkeepers, domestic workers and others (possibly casual, manual labourers and such self-employed groups as milkmen, carpenters and metal smiths).²⁶

The loss of housing in the central areas of the towns was often coupled with a threat to the sources of livelihood of the affected groups, since the places of employment of the poor were usually located near their previous dwellings, especially in the case of labourers and petty traders in centrally-located bazaars. In 1926, for instance, a scheme to clear overcrowding in the Nachghar-Birhana area in Kanpur, situated in the 'bazaar-mandi' (retail and wholesale markets) heartland of the city, displaced the 'lodhas' who lived in the area and worked in the adjacent pulse-grinding workshops in Dalmandi (pulses market). Shifting away from the bazaar zone to urban outskirts made it impossible for them to have easy access to their place of work in the grinding mills.²⁷ The town improvement policies thus adversely affected both housing conditions and economic activities of the poor.

III

Whilst the policies of the improvement trusts and the municipalities caused extensive loss of housing of the poor, the provision of alternatives was entirely inadequate. In theory, the 'internal' schemes of the trusts

to clear congestion and overcrowding were to be supplemented by the simultaneous 'external' schemes of town expansion in order to accommodate the 'dehoused'. The 'external' schemes of development and reclamation of land were adopted to open up new areas for settlement in certain undeveloped pockets within the towns and in urban outskirts. However, as pointed out in an annual report of the Allahabad municipal board in 1937-38, such 'external' schemes had "simply afforded opportunities for the well-to-do middle class men to expand themselves in these areas... They [the poor] have not found, in the improvement trust scheme, suitable quarters for their housing".²⁸ The problem was not so much that the trusts failed to lay out new sites but that the poor had little access to these areas and the beneficiaries were the middle classes.

A priority of the trusts from the outset had been to cater to the demand for land for the construction of buildings. The annual report of the Lucknow improvement trust in 1942 mentioned that the trusts, in the previous two decades, had tried to meet two specific kinds of demand for land for construction. The first kind of demand cited was for residential houses for the urban professional and administrative groups and affluent business people. The policy of the trust was to open up land on the periphery of the city and sell these at relatively low prices for the construction of residential buildings. To counter the low profits accruing from these sales, the trusts tried to meet a second kind of demand for land by commercial investors or property developers. The trusts acquired and redeveloped land in the central areas of the town and sold these for high prices at auctions to property developers, who constructed buildings for letting to shops and commercial establishments.²⁹ As a result of the policy of the trusts to sell newly developed, reclaimed or acquired land either to capitalist investors or to the middle classes, increasing areas of urban land were being built over for commercial purposes or for middle class residential use. This, in addition to the consequent escalation of land prices, created a scarcity of land for the settlement of the poor. The Kanpur improvement trust admitted this fact with remarkable candour and a touch of worldly philosophy: "It is not the rule of the trust, but of the world, that it is the rich that get served first".³⁰

The disinclination of the trusts to provide land for housing of the poor and their eagerness to cater to property developers and real estate investors and to meet the residential needs of the middle classes were undoubtedly because the trustees represented the propertied and commercial classes in towns. Indeed, the trustees and their associates were often themselves interested in investing in land and building construction.

However, a financial consideration was cited by the trusts to account for their inability to allocate land for the poor. From the point of view of the trusts, selling developed land at cheap prices affordable by the poor, or constructing houses to be sold or rented to them at low rates, would not yield substantial returns. The trusts, therefore, considered it financially non-viable to adopt such "unremunerative schemes" "without a sufficient recurring income".³¹ The trusts did not have any such source of recurring income. The initial grants available from the provincial government for town improvement were spent on paying compensation for acquisitions and were locked up in development expenses. To ensure a subsequent flow of income and to remain financially solvent, the trusts therefore sold their developed land to capitalist investors or to affluent people, who could pay high prices for trust land. In view of this financial outlook, the Kanpur trust, for instance, arrived at the firm decision, early in its life in 1921-22, that "it is not economic [for the trust] to put up low rented buildings on [trust] land" to house the poor.³² The trusts therefore chose to operate as commercial ventures rather than as public service institutions intending to subsidise housing for the poor. The trusts had the option of utilising their incomes either to provide housing for the poor or to open up further areas for middle class residences. Financial logic, buttressed by the powerful concern to create safe and sanitary havens for the middle classes, free and far from the threat of the 'insanitary' poor, clearly clinched the issue in favour of the middle classes.

The scarcity of housing land for the poor, precipitated by the policies of the improvement trusts from the 1920s, intensified further by the early 1930s as the demand for building sites by the propertied classes increased even more substantially from the time of the depression.³³ Already from the late 1920s, indigenous bankers in the UP towns had begun to invest their capital in urban land owing to the declining profitability of their banking business, faced with competition from joint-stock banks.³⁴ The economic depression of the early 1930s further stimulated investments on land. The town improvement trusts committee of 1935 attributed it to "the prevailing cheapness of money which makes the purchase of land and construction of houses more profitable than other forms of investment".³⁵ Moreover, the crisis in the agrarian sector during the depression redirected capital to the towns. In Allahabad, for instance, some rural landlords sold their lands in the countryside as they were faced with difficulties in the collection of rents from their tenants. As an alternative form of investment, they bought

urban land to develop housing schemes for the middle classes, to earn rental returns.³⁶ Affluent lawyers and government officials also invested in purchasing land and construction of buildings for rental income. Lucknow was reported to have become "a paradise for contractors and retired officials, who come and settle here and build houses".³⁷

The marked increase in house rents from the time of first world war gave a further fillip to investment in housing as a lucrative source of return on capital. Between 1914 and 1922 house rents had increased by 100 per cent in Lucknow and by 200 per cent in Kanpur between 1914 and 1923.³⁸ The UP government as a matter of policy did not introduce rent ceiling regulations. In the opinion of the government, the problem of scarcity of housing with increasing population in the towns would be aggravated by rent ceiling measures, since "landlords will be encouraged to build more houses, if rents are unrestricted, but will assuredly be discouraged if rents are artificially depressed".³⁹ The Allahabad improvement trust reported in 1935-36 very high returns on capital to owners of completed buildings, constructed for middle class housing or commercial use, on land cleared and improved by the trust.⁴⁰ Due to increased house rents, coupled with low rates of house tax⁴¹ banking or commercial groups, district landlords, lawyers and government servants found it worthwhile to invest in private housing schemes and in real-estate development for commercial renting. The magnitude of this phenomenon in Allahabad was noted in the improvement trust annual report of 1936-37:

The demand for land for construction of houses and shops in the city remains unabated and people are even prepared to advance money on undeveloped lands of the Improvement Trust... The rapidity with which buildings are springing up and multiplying these days in the Municipality and Trust areas is amazing.⁴²

The ever increasing use of urban land for building construction in the interwar period immeasurably aggravated the scarcity of vacant sites for the poor to settle on, at the same time as they were evicted from congested areas that were being acquired, cleared and redeveloped by the trusts. The annual report of the Allahabad municipal board commented in 1941-42 that:

The Improvement Trust and zamindars [urban landlords] have been floating scheme after scheme for the housing of middle class men and whenever these schemes have come into play, the original inhabitants of the place, the poor class people, have been ousted and made to seek new houses in newer surroundings. Thus the poor toss about from place to place and where they go they have to live in an uncongenial atmosphere.⁴³

Due to the inadequate compensation they received for the acquisition of their old houses, they could not afford better housing or high rents in the houses constructed in the newly developed residential settlements,⁴⁴ and "after an intervening period of considerable discomfort... provide[d] themselves with similar undesirable quarters elsewhere".⁴⁵ The poorer sections of the population in the towns therefore had to house themselves in whatever sites and buildings that were available. The Allahabad municipal board reported in 1942 that "on the whole [the] town seems to have very much expanded as far as the houses for the middle class men are concerned", while the poor "have to content themselves with the space and surroundings that may fall to their lot".⁴⁶ They crowded into insanitary and congested buildings and neighbourhoods which were yet to become targets of trust schemes, and where the middle classes were unwilling to live, especially because the latter had the option of shifting to newly developed residential areas. The poor also had to fall back on un-reclaimed and insanitary plots inside and on the periphery of the towns, which were not suitable for construction.

As a result of these developments, the pattern of residential settlement and urban social geography from the inter-war period increasingly mirrored class differences in the towns. The Allahabad municipal board annual reports of 1937-38 and 1941-42 gave detailed descriptions of what were called 'poor houses'.⁴⁷ These descriptions clearly indicate the way in which the poor had been adversely affected by town planning policies, with the emergence of separate concentrations of 'poor houses'. Large settlements of kucha hutments (temporary shanties) of the poor had sprouted in low-lying marshy tracts, undrained ditches and swampy river fronts, which could not be built over. In New Katra in the Beli Road area and in Rajapur, bungalows and cottages had been constructed on the high street-level, while the houses of labourers had come up in the adjacent undrained deep ditches. These areas, according to the municipal reports, were "sadly deprived of sanitary conveniences" and remained waterlogged throughout the monsoon. Labourers, odd job men and hawkers, who needed to live in the central areas of the town near their places of work, housed themselves in the old part of Allahabad in buildings which were insanitary and overcrowded and hence had low rents, as these were deemed unfit for middle class residence. These premises, already over-crowded, became more so, as those who were displaced from their original residences in the course of trust schemes in the central areas were forced to flock to the decreasing number of low-rent

houses available in the neighbourhood. Bazar workers, vegetable vendors and hawkers also lived in and around the 'mandi' (wholesale market) areas in hutments with thatched roofs or in temporary shelters, often within the walled compounds of the markets. These mandis were frequently visited by 'animals of load' which were generally tethered for long hours during the unloading period. Here "mandi owners make practically no arrangement for the removal of rubbish or clearing of open spaces. These areas become invariably plague spots specially during the rains and bad seasons."⁴⁸ Clearly, the policies of the Allahabad trust contributed to worsening living conditions of the poor, as they were being 'ghettoised' in particular areas. This was in marked contrast to the new housing schemes in reclaimed and developed areas, which provided better and planned residential sites for the middle classes who could afford them.

IV

The situation of housing for the poor was somewhat different in Kanpur, although here too class differences were increasingly reflected in settlement patterns. In Allahabad and Lucknow, the improvement trusts were the focus of interest of various propertied groups seeking to invest in urban land and buildings. In comparison, the trust in Kanpur was dominated by members of the Upper India Chamber of Commerce and the UP Chamber of Commerce, who were the chief employers of labour in the local mills and factories.⁴⁹ They therefore had the additional concern of providing housing for the urban workforce in order to ensure an adequate supply of labour. However, the view that the construction of houses for the labouring population was 'unremunerative' dissuaded the trustees from undertaking such projects directly. Instead, the trust decided to open up new areas of land, where houses were to be constructed by private investors and constructors as commercial ventures.

In order to attract private investment on housing for the poor, the trust extended generous incentives and concessions to potential builders. First, to encourage private owners of unused land to undertake housing schemes for the poor, the trust exempted the owners from compulsory acquisition of their vacant and unbuilt-up land, provided they devoted such land to build houses for labourers. The trust undertook to develop these plots by providing drainage and sewerage, for which the landowners were to pay 'betterment' charges.⁵⁰ 'Betterment' charges being considerably lower than the expected rental returns, landowners willingly accepted the 'betterment' package of the trust. Second, in the new areas developed by the trust such as in Sisau, plots were

sold at concessional prices to prospective builders on the condition that they construct houses for mill workers. Third, in certain cases the trust advanced loans at low rates of interest to building contractors, who undertook to build residences for the poor.⁵¹

The incentives extended by the trust had the desired effect of stimulating landowners and builders to construct houses or 'ahatas' (complex of small houses in walled compounds) for the labouring population in Kanpur. Between 1920, when the trust was first inaugurated, and 1935, the total number of houses built on trust land, which mainly accommodated the poor, was 8,430, accounting for an estimated 42,000 people.⁵² In 1935-36 alone, 2,000 workers' quarters had been built on trust land, which housed 10,000 people.⁵³ In Kanpur, therefore, unlike in Allahabad or Lucknow, the improvement trust took the initiative to provide land to house the poor. This did not however mean that the poor in Kanpur thus came to enjoy abundant, attractive and cheap housing. Instead, as pointed out by trade union leaders in Kanpur in 1944, "the areas developed by the improvement trust, as far as the labour areas are concerned, quickly degenerated into slums".⁵⁴ This was primarily because the trust did not subject the house builders and owners to stringent sanitary regulations or rent ceiling, since these would have discouraged the private investors from providing quarters for the poor. If the trust itself tried to provide housing, being a public body, it would have to avoid over crowding and high rents and arrange for such sanitary facilities as public latrines, water supply, drainage and conservancy services, the cost of which was considered to be prohibitive for the trust. However, in the case of private builders and house-owners, the trust could simply turn a blind eye to such conditions, and in fact acknowledged and anticipated in 1921-22 that houses for the poor built by contractors or landlords "would not pass the test of any public building".⁵⁵ The underlying assumption here was that even if new housing had to be created for the working classes, nonetheless they did not need or deserve the standards appropriate for a 'public building', presumably because they were used to and content with substandard housing, in contrast to the middle classes. The perception that the poor were intrinsically prone to filth and squalor could fortify the view that they only desired and were entitled to the minimum of a roof and four walls, and not much more by way of spacious surroundings or sanitary facilities. On paper and in theory, the Kanpur trust of course had to stipulate certain conditions for the builders of private houses of ahata. Ahata-owners were required to adhere to specific regulations, such as less than a certain specified number of houses per acre were to be built to avoid

overcrowding; houses were to be constructed according to sanctioned plans to ensure adequate space and ventilation; rents were to be charged at rates approved by the trust; and conservancy and water supply facilities were to be provided.⁵⁶ However, in practice neither the trust nor the municipal board felt the need to enforce any of these regulations, not only because it would discourage private investment in working class housing, but also because the poor were expected to make do without the requirements of space and sanitation. As a consequence, working class housing emerged as overcrowded "wretched low hovels of one tiny room and verandah, badly built and most insanitary", yet let out at very high rents.⁵⁷

Not surprisingly, the ultimate beneficiaries of trust schemes to provide land for housing the poor in Kanpur turned out to be the house builders, as was evident in the controversial Talaq Mahal Scheme in Kanpur. In Talaq Mahal, 16 acres of land was acquired by the municipal board as a congested insanitary area, evicting the dwellers of *kutchcha* (temporary) houses. It was then sold to a private contractor, Haji Abdul Ghani, to put up new quarters for the poor, on the agreement with the Kanpur trust that the trust would execute the necessary infrastructure of sewerage and drainage while the owner would provide the land required for the main approach road and pay for its construction and for other 'betterment' expenses. The town improvement trusts committee report in 1924 stated that "the general opinion is that the bargain was a poor one and that the owner is reaping a very large profit".⁵⁸ The owner had agreed to abide by the layout for housing quarters prepared by the town planner, H V Lanchester, but the plan subsequently submitted for sanction did not conform to that layout, but had been accepted by the trust nevertheless, as its attitude to private builders was lenient. The area consequently became a congested, insanitary slum.⁵⁹ The landowner of Talaq Mahal, as in almost all other cases, reaped large profits by building substandard houses on trust land, with few sanitary facilities, in which he packed large numbers of the poor who were forced to share accommodation due to high rents.

Thus, in Kanpur as elsewhere, the grand venture of town improvement and housing expansion served only to worsen the conditions of housing of the poor and divided the town spatially more and more into areas of the rich or the middle classes and the poor. For the urban professional, administrative and commercial classes, who could afford to rent houses at high rates or purchase land for the construction of houses, the initiatives of the improvement trusts to open up land for housing were welcome developments; but the poorer classes seldom had access to such land. Moreover, land for settlement for

the poor became increasingly scarce as their congested or overcrowded neighbourhoods were acquired, redeveloped and sold to those who could afford higher prices. The poor were forced to crowd into undeveloped and insanitary areas. Housing, where made available, as in Kanpur, was insanitary, overcrowded and expensive and devoid of conservancy and other municipal services.

V

While the settlements of the poorer sections of the urban population were gradually being 'ghettoised' in specific areas, these areas tended to be neglected by the municipal authorities in providing basic sanitary and conservancy services. Local policies betrayed a bias in favour of the rate-paying electorate in the allocation of civic services and resources. Board members sought to enhance their support from the propertied electorate by supplying them with ward conservancy and public health facilities, often in excess of basic requirements. Municipal services, such as scavenging, conservancy, road maintenance, water supply and lighting, tended to be concentrated in the residential wards and buildings of the propertied rate-payers. Houses and settlements of the poor were largely overlooked. A survey of houses of mill workers in Kanpur in 1939-40 found that 82 per cent of their houses did not have a paved approach road, and 91 per cent of the roads in the residential neighbourhoods of the poor were without any lighting; 61 per cent of the houses had no public latrines and the average number of people using each municipal latrine in poorer neighbourhoods was as high as 47.3.⁶⁰

The decline of urban public health and sanitary conditions was one of the main terms of reference of both the Benares and the Lucknow municipal board enquiry committees, which submitted their reports respectively in 1933 and 1942.⁶¹ It is evident from the findings of these committees that the deterioration of sanitary conditions was not simply a product of administrative mismanagement, nor necessarily of a paucity of civic services due to the financial constraints of municipalities. The reports suggested that the cause of public health problems was the uneven allocation of available municipal services, with a disproportionately large part of the funds and resources being directed to the sanitary maintenance and improvement of the residential localities of the municipal electorate. The Lucknow report, for instance, noted that while urgent road maintenance suffered for the stated reason of "stringency of resources", board members had sanctioned funds to locate parks near the houses of those whom they sought to please.⁶² The Benares report pointed out that road repairs and paving

had been concentrated entirely in the residential areas of influential citizens, being "undertaken according to personal wishes of [board] members".⁶³ When the poor did benefit from municipal projects, very often this happened incidentally in the course of measures undertaken essentially to benefit municipal functionaries and the electorate. Referring to a storm-water drainage project executed by the Benares municipal board, the enquiry committee report stated that the committee members were initially rather pleased that the "municipal authorities for once conceived a great project for relieving the poor inhabitants of the locality from being inundated with storm water during rains". However, the committee members subsequently discovered on closer inspection that the benefit to the poor was merely a by-product of the advantage accruing to the chairman of the board himself, for "close scrutiny shows that the anxiety [to execute the project] was due to the rushing of storm-water through the compound of the late chairman".⁶⁴

In Kanpur, the disinclination of the local authorities to provide necessary municipal services as water supply or conservancy to the neighbourhoods of the poor is also brought out by the fact that the boards often failed to extend these facilities to some new areas in the outskirts of the towns, developed by the improvement trust, on which the poorer classes had come to settle. The municipal board was responsible for supplying civic services to these new areas. The municipal authorities, however, persistently pleaded their inability to accept responsibility for water supply, conservancy and sanitation facilities, on the ground of financial constraints,⁶⁵ although their lack of funds appeared to be most acute when it came specifically to those areas where settlements of the poor had developed on trust land. In Kanpur, the improvement trust had opened up vast areas in Juhi, Sisamay and factory area, which developed as settlements of poorer sections of the population. By the early 1930s, these constituted a larger area of habitation than the entire older portion of the city.⁶⁶ From 1920-21, when these areas first began to be developed, the improvement trust in Kanpur had urged the municipal board to extend water connections to "these large workers' settlement",⁶⁷ yet 10 years later in 1931-30, the "principal problem" in the areas remained the complete lack of water supply.⁶⁸ The Kanpur improvement trust annual reports of the mid-1930s continued to point out the dearth of water supply, conservancy and drainage facilities in these areas.⁶⁹ In 1938-39, the local residents were still complaining to the trust of lack of water supply, absence of sewers, public latrines and conservancy, and the consequent health hazards.⁷⁰

Lack of municipal services in the residential areas of the poor appears to have been one of the significant causes of the high incidence of their morbidity and mortality. Between 1921 and 1928, the average mortality rates were 75.29 and 65.96 per thousand of population respectively in the poorer neighbourhoods of mill workers in Gwaltoli and Khalasi Lines in Kanpur. In comparison, during the same period the average was significantly lower – 34.58 per thousand of population – in the planned workers' settlement built by the British India Corporation (BIC) of millowners, which enjoyed relatively better drainage, conservancy and water supplies.⁷¹ The Kanpur labour enquiry committee in 1938 also mentioned that the incidence of sickness among workers living in the BIC's settlements was "substantially lower than among those living outside."⁷² This contrast suggests that the cause of high mortality and disease among the poor was not simply their general poverty or malnutrition but also the lack of sanitary facilities for them, with the concentration of a major share of municipal services in the residential areas of propertied rate-payers

VI

The changing nature of local policies in the 1920s and 1930s and the central concern of the authorities to make the towns more sanitary and hygienic not only worsened the housing, health and living conditions of the poor, but in many cases placed serious constraints on their economic activities and sources of livelihood. Drives against encroachment on public land, which were undertaken by the municipal boards to reduce congestion and to improve sanitary conditions, adversely affected many groups of the poor, such as hawkers, vendors, hand-cart pullers and drivers of hackney carriages or bullock carts. The acceleration of anti-encroachment drives, mainly conceived as a sanitary measure, however, had an additional dimension relating to changing municipal fiscal policies in the interwar period. From the 1920s, a much larger number of Indian propertied rate-payers were able to exercise control within municipal institutions, following the significant extension of electoral franchise and further devolution of local power by the British government in 1919.⁷³ These rate-payers, not surprisingly, attempted to minimise their own burden of local taxation, primarily by reducing the assessment as well as tempering the rigour and effectiveness of collection of such direct taxes as house tax, which were paid by the propertied.⁷⁴ Instead, they increasingly took recourse to other sources of revenue,⁷⁵ including the licensing of economic activities of hawkers and labourers

more vigorously and effectively than ever before; ever more elaborate mechanisms were set up to enforce these regulations and to hunt down defaulters. This frequently took the form of enhanced imposition of fines and penalties for violation of municipal rules; for example, for not procuring municipal licences by carters and porters; for encroachment on public land by cart-drivers parking their carts on roadsides or by hawkers or vendors who set up pavement shops without municipal permits.⁷⁶ It is not that the enforcement of licensing regulations and the imposition of fines for violation of municipal rules constituted the chief sources of municipal income. However, in a period when the municipal authorities were concerned to reduce direct taxation and maximise income from all other possible sources, they could ill-brook the evasion of dues and licensing fees by hawkers and carters, and they were also eager to rake in revenue from fines for encroachment on municipal land whenever possible. These fiscal measures, of course, went hand in hand with a discourse of local administration which increasingly and vocally condemned the poor and their activities as defiling and ugly hlots on the urban landscapes, which had to be regulated and controlled. One set of figures, indicating the increase in collection of fines by the municipalities between the 1910s and the 1920s, brings out the extent to which the poor were affected by these changing municipal fiscal preferences in the interwar period. In the financial year 1917-18, the income of the Kanpur municipality from fines was Rs 6,603, but by 1927-28 this had increased to Rs 25,237. Corresponding figures for Lucknow were Rs 12,674 and Rs 26,662; for Benares, Rs 6,776 and Rs 20,537; and for Allahabad, Rs 8,725 and Rs 16,206.⁷⁷

Anti-encroachment campaigns thus emerged as one of the chief preoccupations of the local authorities from the 1920s, both as part of the grand plan to reduce insanitary conditions and overcrowding and as a new aspect of municipal fiscal policies. The prime targets of anti-encroachment measures were hawkers, vendors, transport pliers and carters, as well as artisans or workmen who worked on the roadsides. "The great insanitary features of roads" that the municipal authorities had specially identified, were "small cabins of such shopkeepers as betel leaf sellers, 'chat' [cooked snacks] sellers, vendors".⁷⁸ Similarly, "tradesmen and craftsmen as iron smiths and carpenters" were held responsible for causing insanitary conditions, for "the roadside 'patris' [pavements] are, as a matter of fact, godowns for their shops and working-tables for their workshops." Yet another "insanitary feature" singled out included "the parking of hackney carriages and hackney carriage animals".

According to the municipal authorities, all of these were special impediments to ensuring sanitation, for they caused "a complete blockage to the movement of pedestrians and much obstruction in cleaning the patris and drains".⁷⁹ The view of the municipal authorities was clearly that the hawkers, vendors, carters and workmen were intrinsically insanitary in their habits and practices; they were suspected of wanting to lay out their wares and to set down for work wherever and whenever they could find the opportunity, without being troubled by any high-minded civic spirit to keep the towns tidy and orderly.

One remedy to stamp out such 'insanitary' activities was to enhance the collection of 'tehbazari' dues or ground rent from roadside hawkers and to impose fines for encroachment at exorbitant rates, "which would be out of most pockets, the purpose being to prohibit petty shopkeepers and vendors to occupy roadsides".⁸⁰ The usual policy pursued also included the demolition of shops, confiscation and removal of goods or vehicles and animals, and the prosecution and fining of 'offenders'.⁸¹ By the 1930s, such drives against encroachment by petty shopkeepers were stepped up, as many more temporary shops or stalls of hawkers and vendors began to appear with the growth of population and petty trading activities in the towns.⁸² There were also attempts to make the system of prosecution more effective. The Kanpur municipal board took recourse to 'moving courts' of city magistrates, who would prosecute and fine the encroachers on the spot. This was designed to ensure that the vendors would not flee from the place of encroachment to evade prosecutions and fines. The municipal authorities expected this measure to exercise a strong deterrent effect against future encroachment elsewhere.⁸³ In the 1930s, the municipal boards also frequently enlisted the help of the district authorities and the police to enforce measures against encroachment, since the removal of encroachments gradually elicited severe resistance and had "become dangerous and the Demolition Overseers often face[d] great difficulties".⁸⁴ Coercion and violence, thus, also increasingly became an integral feature of the experience of displacement and dispossession of the poor.

The implementation of these vigorous anti-encroachment measures, as well as the enforcement of municipal licensing regulations, severely hindered the work and employment of those sections of the poor who were targeted, and often jeopardised their sources of livelihood. In particular, such measures deepened the scarcity of shop space faced by hawkers and vendors. Petty trading activities increased in the towns in the interwar period amongst the poor, either as a permanent source of livelihood or to

supplement income from manual labour, especially during periods of lack of employment. As a result, competition among hawkers and vendors for access to shop space intensified in the central trading districts in the towns. Gaining a foothold in the bazaar areas was the first step to securing business and customers. It was especially difficult for hawkers and vendors to find shop space in these areas. Renting shop space from private building owners at the prevailing high commercial rates was beyond their means. The provision of shop space by the municipal boards was inadequate, as municipal markets were few in number. Besides, the boards frequently leased out shop space through auctions, where petty traders were outbid by richer merchants. Moreover, large municipal markets were usually leased out to contractors, who then let out individual shops or stalls. Rents in such cases tended to be high, as the lessees charged high rates to earn profits after paying off the lease dues to the municipalities. Due to the lack of cheap shop space, vendors and hawkers generally took recourse to setting up temporary shops or stalls on roadsides. However, the zealous anti-encroachment drives of the local authorities in the interwar period rendered this option increasingly difficult and seriously restricted their trading opportunities.

In contrast to the treatment meted out by the municipal authorities to the encroachments of the hawkers, the richer shopkeepers, with permanent shops in buildings in the bazaars, had a far better deal. The latter were also frequently guilty of encroachments on public land through projections of their shops on to the pavements, in the form of 'pucca' or permanent 'chhajjas' (canopies) and 'chabutras' (platforms). However, the municipalities were not inclined to demolish these permanent extensions, on the ground that "they cannot be reclaimed after the superstructure is erected", and because demolition costs would be prohibitive.⁸⁵ Besides, such permanent or pucca additions to shops were allowed to stand for the additional reason that the boards could either sell or charge rents on the encroached area of land as a source of municipal revenue.⁸⁶ The lenient attitude towards the more affluent shopkeepers, however, arose equally because it was the poorer hawkers who were thought to be primarily responsible for causing insanitary conditions.

The difference in municipal policy towards the encroachments of richer merchants on the one hand and hawkers and vendors on the other in fact tended to bias urban trading activities in the towns in favour of the former, often to the detriment of the latter. Municipal evictions and demolition of encroachments by petty traders in the bazaar areas played

into the hands of richer merchants, who were often concerned to reduce the competition from smaller shopkeepers in central commercial areas, since the latter could offer goods at cheaper prices due to the low establishment costs of their temporary shops and stalls. In seeking to keep hawkers away from the central bazaars, the bigger shopkeepers deployed the argument of encroachment and congestion. Controversies in the 1920s and 1930s involving pavement shops and stalls of hawkers at Aminabad in Lucknow and at Collectorganj, Moolganj, Halsey Road and Bansmandi in Kanpur illustrate the growing conflict over shop spaces and trading activities between the hawkers and the more affluent merchants. The obstruction of roads by vendors and hawkers in Aminabad engaged the attention of the Lucknow Municipal Board from 1932, as the "police and merchants kept complaining of nuisance caused by hawkers".⁸⁷ The merchants complained that the board did not prevent hawkers from setting up stalls in front of the shops in buildings, which caused "nuisance before the sites of their shops" and "failed to secure ... their right to proper approach".⁸⁸ The owners of cloth shops in the Sarfaraj building, for instance, argued that the view and access to their shops were being obstructed by pavement hawkers and hence their clientele was decreasing. After receiving innumerable objections by the owners of a cloth shop in the building, the board cancelled the trading licence of some pavement hawkers.⁸⁹ By the late 1930s, the complaints of richer merchants in Aminabad grew even more vocal and the executive officer of the board reported to the Lucknow municipal board enquiry committee that "quite a number of unauthorised shops are being removed almost daily by seizing goods and putting them to auction in case they refuse to pay removal charges".⁹⁰

In the Collectorganj area in Kanpur, wholesale grain merchants were similarly able to enlist the support of the local authorities in expanding their shop space and keeping the bazaar area clear of 'phariyas' or retail grain sellers who set up temporary stalls on the roadsides. In 1921-22, the Dhankutti scheme of the improvement trust was launched to evict the phariyas from the Collectorganj grain market and to relocate them in Dhankutti. The aim was both to relieve congestion in Collectorganj and to accommodate the demand of the arhatiyas (wholesale grain dealers) for more space for their shops and godowns.⁹¹ This attempt met with protests and agitation of the phariyas and the Dhankutti Scheme had to be temporarily shelved. However, the municipal board in 1924, perhaps to facilitate the removal of the phariyas on the failure of the trust to do so, imposed a high licence fee

of three rupees on the Collectorganj phariyas, and non-licensed phariyas settling up temporary shops in the area were prosecuted.⁹² This appears to have produced the intended result, for the number of licensed phariyas in 1924-25 was 56 but by 1930-31 the number had dwindled to nine.⁹³ Similarly, in the adjacent bazaar areas of Moolganj, Halsey Road, Couperganj and Bansmandi, the municipal board tried to minimise the number of hawkers through repeated and vigorous clearance drives, thus hindering the access of hawkers to this vital business area. The reasons for such "vigorous clearance" were cited to be the restricted access to shops and godowns of wholesale merchants, and more importantly, the insanitary conditions, congestion and obstruction of traffic caused by the hawkers.⁹⁴ However, the ultimate impact of municipal policies was to render petty trading activities in the towns more and more difficult, thus accentuating the problem of sources of livelihood for those sections of the poor who sought employment as hawkers and vendors. Moreover, measures against encroachment and congestion directed towards the carters and porters, as well as the enforcement of licensing regulations for them noted earlier, similarly threatened their economic activities.

VII

In UP the 'problem' of the urban poor emerged most prominently in the interwar years and came to stay. The growth of urban poverty was of course partly a product of such economic forces as the crisis in the agrarian sector and urban migration. However, the analysis in this paper indicates that poverty and dispossession worsened due to the changing preoccupations of local policies. It was not simply that impersonal economic or 'market' forces worked against the poor, but more importantly, the local authorities lent a helping hand. The 'problem' of the poor was created in no small measure by the local authorities, as their vigorous town improvement policies from the interwar period impinged more and more directly and extensively on the economic activities, housing and settlement patterns of the poor. The apparently noble undertaking of the local authorities to make the towns orderly and free of filth and disease aggravated homelessness and overcrowding for the poor, just as similar ventures to keep the bazaars clean and sanitary served only to heighten poverty and unemployment amongst hawkers and labourers. This is not only because the poor were the direct targets of local policies, but also because local administration reflected the interests of the propertied and biased policies in their favour. Equally important, the notion that the poor constituted the main 'problem' which impeded orderly

urban development was elaborated and gained increasing orthodoxy in local administration and in policy discourse from the interwar period. The deteriorating living conditions of the poor, caused partly by local policies, reinforced the worst images of the poor as undesirable and squalor-ridden in the minds of the propertied classes. This prompted further and more concerted and coercive initiatives to deal with the 'problem' of the poor, and the cycle perpetuated as a self-fulfilling prophecy with long-term consequences in framing developmental policies.

The political outcome has been no less significant. The interwar period saw growing political unrest and disturbances in the towns. On the one hand, there were growing protests and resistance by various groups of the poor against local policies, eliciting even more determined and resolute initiatives by the local authorities, more and more frequently with the help of the police to enforce municipal measures. This in turn precipitated confrontations, often violent, between the police and the poor, and increasingly reinforced the reputation of the poor as lawless and disorderly, in addition to being filthy and undesirable. On the other hand, competition and conflict intensified amongst the poor themselves for scarce housing and economic opportunities, and clashes ensued, often feeding into communal riots, thus further reinforcing the violent and criminal image of the poor. Indeed, the force and coercion that accompanied the implementation of local policies, as well as the tension and conflict generated by them, constituted a crucial dimension of the context for growing violence in urban north India from the interwar period onwards. The political impact of local policies and their implications for urban violence are, however, not the main concern of this paper. Instead, this paper has sought to highlight that poverty, dispossession and ill-health were aggravated, and urban class differences sharpened, not simply by economic forces nor by strictly economic measures, but equally by the policies and discourse of local administration relating to sanitary and urban improvement. In addition, the identification of the poor as the chief perpetrators of urban overcrowding and worsening health conditions came to form one of the central guiding principles of local policies.

Notes

- 1 *Census of India, 1931*, Volume XVIII, Part I Report (Allahabad, 1933), pp 127-28, 141-42. The large towns witnessed very significant demographic expansion due to immigration in the 1920s and 1930s. Thus, in Kanpur, out of a total population of 2,19,189 in 1931, nearly 40,953 had migrated to the town between 1921 and 1931; in Lucknow, the population in 1931 was 2,51,097 and

32,956 migrated to the town between 1921 and 1931, in Allahabad, 16,670 migrated in this period, when the total population reached 1,73,895; in Benares, out of 2,01,137 people in 1931, 14,486 came between 1921 and 1931.

- 2 Those who qualified as municipal electors included payers of municipal direct taxes, payers of income tax, owners and occupiers of houses or buildings over a specified value, landowners paying or assessed for land revenue over a specified minimum amount, tenants paying rents over a specified sum and university graduates. See *The United Provinces Municipalities Act, 1916* (Act No II of 1916), chapter II, section 14: 'Qualification of electors'. These franchise regulations qualified only a small propertied section of the urban population to vote in local elections. For instance, in Kanpur, out of a total population of 2,16,436 enumerated in the 1921 census, only 19,395 people, or 8 per cent of the population, formed the electorate of local councils in 1923. Kanpur Municipal Board [hereafter KMB] *Annual Report, 1922-23*, p 3.

- 6 The gradual abandonment of draconian plague measures all over India by the end of the 1890s is discussed in D Arnold, 'Touching the Body: Perspectives on the Indian Plague', pp 50-90; I Klein, 'Plague Policy and Popular Unrest in British India', pp 723-55.
- 7 Oldenburg discusses vigorous measures of sanitary improvement in Lucknow in the later 19th century, but her account shows that these measures were limited to particular areas. They were specifically and mainly directed to make the town safe and healthy for the British civil and military personnel and were therefore not extensive in their territorial scope. Moreover, there does not seem to be much evidence of any particular concern about the poor; instead the Indian population of Lucknow in general was considered to be insanitary. Political Parties, Development Policies and Pragmatism in a Changing World

Lessons from Vietnam

M S Shivakumar

In recent years, Vietnam has recorded remarkably high growth rates whilst ensuring equity and national predominance by adopting policies that in some ways balanced the role of the Communist Party, state and private sectors. Reforms, in general, were undertaken keeping socialist principles and institutions intact. This paper attempts to provide an overview of the most important political developments in Vietnam since 1986, and examines the role of the party in shaping the perspectives of the state and the private sectors that guarantees social and economic equities. For this analysis, the 8th national party congress, held in June 1996, in Hanoi, is considered as a point of reference. It concludes that the party's hold on the population remains strong, and the current changes in Vietnam will help Hanoi defend its sovereignty, not only economically, but also culturally and politically. It seems possible that Vietnam will develop in tandem with China but with a lesser role for the party in state affairs.

THE crisis in world socialism in the second half of the 1980s had very different results in Asia and Europe.¹ All of the eastern European governments fell or were recreated, and neither they nor their successor regimes were able to generate satisfactory economic growth through market reforms. If these states are at all to succeed economically, it will only be after a long period of severe crisis. In contrast, the communist states of Asia, mainly China and Vietnam, succeeded amazingly well with their economic reforms. They introduced a strategy which is now generally called a 'popular capitalist movement', with the emphasis on significant growth in agriculture, internal and external trade, and higher investment in industry. At the same time, the communist parties have retained their political monopoly. The great paradox of the communist upheaval, of the late 1980s and early 1990s, is that the transition to popular capitalism was by far the most successful in countries where the communist regimes survived. Some issues which affected both east European and Asian socialist economies were how they should deal with the, formerly, public sector units and their reorganisation, what reforms should be pursued to maintain a balance between the political processes and the development of a private sector, and how these changes would affect the poor and other vulnerable groups? In Asia, four communist regimes, China, Laos, Vietnam and North Korea, survived the turbulent 1980s. In terms of economic reform, as of the mid-1990s, both China and Vietnam are well ahead of the other two nations. While China's political and restructuring processes are better studied, Vietnam remains a fertile area for researchers and political analysts.²

Vietnam has been carrying out an ambitious adjustment and reform programme ('Doi Moi') since 1989 and is making a

steady transition to a market economy. The country has achieved notable success with its reforms and initial structural change included the de-collectivisation of agriculture, price liberalisation, unification and devaluation of the exchange rate, and hardening of budget constraints for state enterprises. It also sought to reduce the fiscal deficit and eliminate subsidies. The impact has been particularly evident in the agricultural sector, where the country has been transformed very quickly from a rice importer to a major rice exporter. The role of private trade and production in agriculture has increased to more than offset the contraction of the state sector. Overall, Vietnam's transition experience stands out from other formerly command economies, as well as countries undergoing radical structural adjustment programmes. Firstly, the emphasised importance of agriculture, rather than industry, has helped most Vietnamese households to adapt themselves with less difficulty to changing conditions. Secondly, the quick pace of absorption of retrenched workers from state-owned enterprises into agriculture and growing private sector, particularly in the services segment was invaluable. And lastly, the continued provision of social services has made the transition easier for families. As a result of these factors, the social costs of adjustment in Vietnam have been milder than experienced elsewhere. Whilst the initial phase of reforms boosted the party position, the impact of these changes began to emerge, and by late 1993 it became obvious that not all of the changes were beneficial. The arrival of foreign capital also began to create new problems and put even more pressure on the leadership to pick up the pace of reform, particularly with regard to workers, wages and social subsidies.

After some years of trumpeting its potential to prospective investors and the donor

community, in 1995 Vietnam found itself in the more uncomfortable role of having to live up to its promises. At least in the near future, Vietnam looks unlikely to face serious problems in repaying its overseas debts, as foreign capital is still arriving into the country in significant amounts. By the end of September 1996, the government had approved 3.6 billion dollars in new foreign investment projects, as compared with 5.43 billion dollars in the same period last year. The majority of investment so far has come from, respectively, Taiwan, South Korea, Singapore, Japan, Hong Kong and Thailand, underscoring the regional strength in investment. But this has not been sufficient to encourage investors to commit more funds.

Considering the above, the Eighth National Party Congress of the Communist Party of Vietnam (CPV) on June 28-July 1, 1996, received much global attention from political leaders, the business community, scholars and lay citizens as well. What unique characteristics allow the continued monopoly of the party over government and administration in Vietnam? What is the contribution of the party towards socio-economic progress, and how is this being realised? How do the party cadre react to changes in the state processes? Further, some leaders felt that the party was moving away from its rural base and recommend a rethink on the development strategies being pursued. The party congress also received much attention, for the most part for obvious reasons, reflecting anxiety which prevailed among foreign investors. This paper attempts to provide some response, as part of the debate, to such questions which persist, through an overview of the most important political developments in Vietnam since 1986. It also aims to provide a summary of the discussions and outcome of the Eighth National Party Congress, within the broader

context of the political economy of that nation.

BACKGROUND

The origins of the Communist Party of Vietnam can be traced back to a meeting of a small group of radicals at a gathering, in February 1930, in Hong Kong's Kowloon and this event was known as 'Conference for Foundation of the Party'. Ho Chi Minh presided over this gathering in which the three communist organisations of Vietnam merged to form one political unit, i.e., the CPV. The CPV's platform, strategy and statutes were also adopted. In October of that year, the interim central committee plenum adopted the party's political manifesto, changing its name to the Communist Party of Indochina.

The political stage was crowded until liberation. Prior to 1945 some parties established themselves but they were unable to develop. Legendary revolutionary movements like Can Vuong and Yen The burst onto the political scene, but disappeared quickly, despite their stated goal to expel the French. Local groups, often propped up by foreign aid, such as the Vietnam National Party and the Vietnam Revolutionary Party, never met the demands of the rural poor, and betrayed time and again their willingness to bargain away the nation's best interests in favour of the rich and powerful. 'Uncle' Ho's party, however, made in-roads in the rural areas and consolidated itself as a strong people's movement. It led Vietnam to gain independence in 1945, expelled the French in 1954, and the Americans in 1975. At each stage of its struggle the National Party Congress, as we will see later in this piece, assumed significance.

The first national party congress was held in March 1935 in Macao, at which 13 delegations, representing 1,597 party members within and outside Vietnam, took part. The second national party congress was held in Tuyen Quang Province, Vietnam, in February 1951, with 211 delegates representing 7,61,000 party members in attendance. Between 1935 and 1951 the party promulgated an intense political movement under a broad banner, the 'Popular Anti-Imperialist Front' (later renamed as Popular Democratic Front). During this period, members of the party were active with their socialist counterparts all over the globe. At the second congress the party was recast, and the Workers' Party of Vietnam (inheriting the traditions of the CPV and Communist Party of Indochina) was established. The key task of this new party was to defeat French colonialism in Vietnam. By the time the third national party congress was held, in September 1960, in Hanoi, the Viet Minh had established their principles

and purposes. In his opening speech to the 576 delegates representing nearly 5,50,000 members at the Congress, Ho Chi Minh declared: "This Congress is the Congress of building socialism in the north and struggling for peaceful reunification of the country..."

What happened since the third national party congress is now part of history. Any assessment of why the US found it so difficult to cope with the special circumstances of Vietnam, and the role of national institutions are subjects of special interest (refer to this writer's earlier pieces in *EPW*: July 22, 1995; December 16, 1995; January 6, 1996). The fourth national party congress held in December 1976 in Hanoi attended by 1,008 delegates representing 1.5 million members, was euphoric. It marked Vietnam's victory over the west and its allies, mainly the forces of the US, and the reunification of the South and North into one nation. The party's name was changed from Worker's Party of Vietnam to the Communist Party of Vietnam. However, the elation was short-lived. In the words of Nong Duc Man, currently a politburo member and parliament's speaker: "Till 1980, the Party was delighted with its success over the world's three superpowers, i.e., France, Japan and the US. Its main goal then was to deal with China, who saw 'threats from Vietnam' all the time. This resulted in a brief war between China and Vietnam in 1979. During this period, the economy was obviously neglected and this led to shortages in essential commodities. People started asking 'does socialism allow us to starve and die'? The end of rationing was necessary to change the lives of the people. At that stage we began to rethink."

The party realised its mistakes and tacitly acknowledged this in the documents presented at the fifth national party congress held in 1982 in Hanoi with 1,033 delegates representing more than 1.7 million members taking part stating that: "During the years in the past, in certain aspects, mistakes and errors in management, made by the Party and the government, have served as the main cause of, or have deepened, the difficult situation in society and the economy. We need to refocus on social and economic management." This congress charted the directions, tasks and main targets in the socio-economic fields of the nation for the 1982-1986 period. However, a continuing trade embargo and economic blockade, imposed by the west and other nations in the region, the tough stance of China against Vietnam in every sphere, and Vietnam's virtual isolation in the international arena, specifically attributed to its invasion of neighbouring Cambodia, hampered socio-economic progress. Only the Soviet-Vietnamese relationship³ sustained Vietnam throughout that turbulent and difficult period.

Nguyen Xuan Oanh, veteran economist, offers the following explanation as to the difficulties faced by Vietnam since 1976:

The 1954 partitioning of Vietnam resulted in two contrasting economic systems which did not make any progress between 1976-81. The socialist system of the North was characterised by the collectivisation of agriculture [enforced in 1956], and an attempt to build an industrial base and infrastructure based on a classic socialist model. On the contrary, the economy of the South was patterned on a market model but was heavily dependent on external grants and aid. Some changes introduced after the reunification, in 1975 were ineffective. Although the need for alleviating the shortcomings of the existing economic management had been repeatedly pointed out, the reform was continuously delayed due to the lack of consensus over what course should be taken.

For example, a contract system was first introduced in the agricultural sector in 1979, essentially consisting of contracting an output quota with individual farmers; instead of the whole co-operative. However, the new waves of price increases totally destroyed the effectiveness of the contract system. The arbitrarily determined prices of state supplies at all levels, trailing by far free market prices, naturally bred a system of siphoning off essential commodities, and factors of production, to the free market. The price gap was open to exploitation by all speculators. The inevitable consequence of this was that far less essential goods were delivered to the farmers, who were, however, required to pay for the inputs anyway, the payment of which had been previously incorporated into their production quota. As a consequence, their income was considerably reduced, and paddy production was not substantial. The growth rate of paddy production went down, from 5.7 per cent in 1981 to 1.3 per cent in 1985, and a food crisis appeared imminent. It became obvious that Vietnam suffered from acute macro-economic problems, manifested conspicuously in triple digit inflation, difficulties in debt servicing, an alarmingly poor economic performance and the deterioration of living standards. Ten years (1975-1985) of disappointing economic performance persuaded the party, at its sixth national party congress, in 1986, to propose vigorous reforms.

PROGRESS SINCE 1986

The sixth national party congress, held in December 1986 (1,229 members representing more than two million members turning out) was severely critical of the "bureaucratically centralised management of the command economy based on state subsidies...". The politburo excluded three powerful veterans and elected a lesser-known reformer, Nguyen Van Linh, as the new

party secretary. The main goal for the new leadership constituted in 1986 was to achieve economic growth, the result of which would determine policies in almost every domain, political ideology, social policy, foreign policy, etc. To encourage economic growth it was not enough to simply dismantle 'socialist structures' like agricultural collectives, reduce defence expenditure or let the market loose. It was necessary to obtain foreign resources, through investments and loans, to support the expansion of infrastructure and industry.

To alleviate the difficult conditions, the party introduced, in 1986, a new concept, 'Doi Moi'. This renovation strategy included the following features by which to redirect the economy towards market-oriented policies: the decollectivisation of agriculture and the return to family-based farming, the devaluation and unification of exchange rates; significant rationalisation of the public sector, including state-owned enterprises (SOEs); the maintenance of highly positive interest rates; a significant reduction in subsidies and the state budget deficit, and a more open door policy with the outside world. Vietnam promoted foreign trade, direct foreign investment and development co-operation. Briefly, Doi Moi had two major objectives. Firstly, investment priority should change from heavy industry, which was once the symbol of socialistic industrialisation, to industries more linked to daily life and consumption, or those sectors in which Vietnam enjoyed relative advantage, in agriculture and light industries with export-orientation. This shift in priority was to be accompanied by a drastic change in existing macro-economic management. Secondly, to develop and nurture sources of development assistance and investment, i.e. to extend economic relations with the west and others, without restricting this to the Soviet Union, which had previously been the case. Nevertheless, the changes did not take place immediately.

The situation continued to deteriorate between 1986 and 1989, and the reforms, under Doi Moi, stood little chance of success, the reasons being varied. The economy of Vietnam was fragile on the one hand, having freshly recovered from a prolonged 40-year national struggle for independence, and on the other hand Vietnam was still unfamiliar with the interplay of market forces, having been barely initiated into the workings of market mechanisms. In addition, instead of receiving massive financial and monetary support from foreign sources, both in the form of standby arrangements from international agencies, or long-term credit with easy terms of repayment, Vietnam was virtually isolated in its concentrated efforts for economic rehabilitation and stabilisation. It was only in 1989 that Vietnam introduced

its comprehensive programme of adjustment and reform. Furthermore, the drastic changes in Russo-Vietnamese relations since 1989 exerted a considerable influence on the Vietnamese economy. Overall, progress made was insignificant and the situation continued to deteriorate, at least in the short run.

This difficult phase was preceded by the introduction of a new investment law, in 1987, the contents of which were somewhat in conflict with the socialist constitution, requiring a foreign policy that could normalise Vietnam's relations with China, Japan, all of its south-east Asian neighbours, as well as obtaining some positive signs from the US as to the ending of its embargo. Apart from the new investment law, in 1988 the currency was made fully convertible (first socialist nation to do so), and interestingly succeeded in avoiding hyperinflation. Some analysts explain that many families put their hidden capital into circulation. Furthermore, subsequent growth in internal trade and the 'cross border' exchange of goods and services with Thailand and an increase in rice exports brought widespread satisfaction and enthusiasm. This strengthened the Party's resolve and it took more bold measures, such as in March 1989, when the state began to dismantle the system of fixed prices.

The mid-term review committee of the party, which met in mid-1989 to examine the progress made under Doi Moi, was challenged with many practical and strategic issues while struggling to maintain political control of the process of economic change. The collapse of the Soviet Union and the eastern allies led to a desire for more ideological strengthening in Vietnam, while facing new difficulties in its economy, brought about by the new Russo-Vietnamese relationship.

The year 1991 was a decisive year for Vietnam. The breakup of the Soviet Union, the ending of economic aid from Russia, and the failure of an attempt to normalise relations with the US, must have been traumatic for the party leadership. Vietnam made huge concessions on the thorny Cambodian issue, completely withdrawing its forces in late 1989, and accepting a comprehensive UN plan which allowed for the legitimisation of a devoutly anti-Vietnam Khmer Rouge and their inclusion in the 'normal political scene' in Cambodia. Relations with China were normalised in late 1991.

When the 1,176 delegates representing 2.2 million members assembled in June 1991 for the seventh national party congress, the key message to the leaders was obvious, to continue the reforms and implement political strategies which would support economic growth. Doctrinaire leaders as well as the most avid reformers lost power, and the new

politburo became a compromise-seeking body, where a China-oriented, conservative 'security block', represented by General Le Duc Anh (president from September 1992), opposed a 'reform faction', led by the prime minister, Vo Van Kiet. This 'security block' is prominent in the army, police and the party bureaucracy, while the 'reformers' seem to command the new economic institutions, the civilian ministries and the majority of the national assembly.

External assistance, however meagre, was delivered to Vietnam from 1990 onwards, as the World Bank and International Monetary Fund (IMF) followed up on their earlier discussions. That year, the European Union, USAID, and the World Bank also provided some support. In 1992, Japan, Australia and other nations such as Sweden, the Netherlands and Belgium, resumed their full aid programmes to Vietnam, and after Bill Clinton assumed the leadership in the US, the severity of the US embargo was gradually reduced. In fact, the US further normalised relations by reopening its embassy in August 1995 in Vietnam. The entry of Vietnam into ASEAN also had some effect on the party. In July 1992, Vietnam formally signed the Bali Treaty to become a member of the ASEAN group and gained full membership status in July 1995. Thus, a 'full cycle' of change in foreign relations and diplomacy was pursued, which helped Vietnam to access external resources which began to arrive by late 1987 and gained momentum in 1994. In sum, financial support was made available only after Vietnam introduced a comprehensive set of reforms, and made amendments to its foreign policy. Even then the assistance was not sufficient to overcome growing difficulties.

Between 1986 and 1995, traders and merchants contributed differently to the economic growth. The old Vietnamese trade routes were re-established, e.g. the Chinese merchant cities like Hong Kong and Singapore emerged as main points of contact. Further investment in the growing Vietnamese economy came mainly from the east and south-east Asian nations, with Taiwan, South Korea and Thailand maintaining the lead. The US embargo in a sense protected Vietnam from too powerful an influx of foreign capital, and thus allowed the development of a localised and rudimentary, but very lively, private sector.

Armed with the mandate of Doi Moi, and additional support from the party, the new leadership adopted a new constitution in April 1992 'approving' all of the economic laws that were in conflict with the socialist principles of the party. Simultaneously, elections in July 1992 to the 9th national assembly were organised. For the west, this election was seen to be 'undemocratic', as it allowed no opposition, and each

constituency selected a candidate through an elaborate screening process. However, one has to admit to the fact that the members of the national assembly were younger and better trained than those of the previous one. The new assembly continued the process started by its predecessor, moving towards more genuine debate, and voting on government proposals.

The party's commitment to Doi Moi was also well reflected in the 1992 constitution, and the legislation which was adopted later. The new constitution recognised the rights of SOEs, co-operatives and individuals to engage in economic activities, invest capital and to own and transfer property. It also provided guarantees against the nationalisation of private property. The mid-term national conference of Vietnam's communist party, held in January 1994, reaffirmed the strategy of Doi Moi. The reform of public administration and SOEs featured prominently on the party's/government agenda. It also committed itself to strengthening the legal and institutional framework for private investment. At the same time, there was, and is, growing concern within the party and the government about the potentially adverse social impacts of the reform process. Increased emphasis is expected to be given to social development, with a continuing pledge to fight against mounting corruption, smuggling, waste and other social problems.

Popular movements, in any communist nation, are based on the support of the poor, especially the working class. Workers from SOEs form a large portion of the party membership. Since 1989-90, the SOE sector in Vietnam has undergone important reforms, which have increased the autonomy of the market and imposed hard budget constraints on the state. The first stage of reforms addressed the size and composition of the state enterprise sector. The SOEs account for less than 10 per cent of employees, dominate industry, banking, trade and transport. The roughly 7,000 SOEs, most of them small-scale, only a third of which are profitable, represent a quarter of Vietnam's economic output and provide more than half of the government's budget revenue. The changes were marked by a large redeployment of labour since 1989, retrenching about one-third of the 2.6 million employees of the SOEs. The burden fell most heavily on unskilled and women workers, and with their jobs, workers also lost social subsidies which the state provided. Such massive reductions in, and restructuring of the public sector left the party with a displeased cadre. These workers appeared more vulnerable to change because they were less able to adjust to a changing environment and to take advantage of new job opportunities. In addition, progress in

the reform of the regulatory framework for private enterprise and foreign trade has subjected state enterprises to increased domestic and international competition.

Dang Nguyen Anh (1989), in an important study on the laying off of workers from state enterprises, observes that women were particularly affected by redundancies in the restructuring of the state sector. Some reports estimate that around 70 per cent of all laid-off employees were women. The loss of associated benefits - child care, maternity leave, etc - was more significant in many ways than the loss of official salaries, whose value has been eroded by inflation, and, since typically insufficient, were usually supplemented by income from outside work. The fact that women were the first to be laid off in restructuring the state enterprises supports the thesis that households became the main unit of production, while facilities such as child care were decreased in number. However, opportunities now existed for moves into newly emerging sectors of the economy, e.g. small-scale service provisions, and many prospered, often developing further the outside work which had previously supplemented inadequate state salaries. The costs associated with this period were therefore relatively temporary in terms of income loss, and often, but by no means always, involved a short period of unwaged work (or unemployment) while the market for services developed or the mechanisms were developed by the state to license private traders.

Among male workers, while the state enterprises were being dismantled, the resulting unemployment appeared disastrous and few of them could find new jobs. As agriculture has done well since 1989, explaining a large part of the success in overcoming the difficult transition to a market economy. Nevertheless, the party was pressed to look at the reforms and strengthen its alliance with the workers.

Continuing reform in these units is a major task for the government and party. To date, most subsidies to SOEs have been abolished, but state firms still enjoy some advantages in gaining access to land and commercial credit. By downsizing the SOEs, Vietnam pursued a hard and agonising phase of the reforms, and has survived the resulting tensions between party and workers, state sector and private enterprises, and the unemployment among laid off workers.

Whether in popular memory or in official propaganda, poverty in Vietnam has never been seen as simply a matter of material income. The experiences of colonialism and neo-colonialism, and of the so-called 'feudal' system, were expressed in terms of personal humiliation, violence, degradation and loss of traditional community solidarity. This aspect of Vietnamese society found

expression in such areas as a well developed notion of local 'commons', the obligations of the central government, the emperor and his mandarinates, to retain basic equity, and an intense interest in the articulation of fate and personal talent, perhaps the most basic human issue of poverty. It is therefore quite easy to understand that purely income-based notions of poverty are rather recent arrivals in the Vietnamese approach. It is also noteworthy that the path-breaking official surveys of 1988-90, which focused upon income, were domestically funded and coincided with the shift to a market economy and de-collectivisation. One can thus see the emergence of an income basis for defining poverty, parallel with the shift in the national development agenda.

Recent poverty assessments, based on income, establish that about 60 per cent of the Vietnamese population is poor. An important finding is that poverty among state employees is very low, at less than 2 per cent of all the poor in Vietnam living in households headed by government workers. By far the highest incidence of poverty, 60 per cent, is found among farmers. Since most Vietnamese live in agricultural households which have an above-average incidence of poverty, more than three-quarters of the poor in Vietnam, 76 per cent, are concentrated among the farming population. With the exception of Chinese, the ethnic minorities have a much higher incidence of poverty than the national average, ranging from 66 per cent among the Tay to 100 per cent of the H'mong.

Seen against this background of factors and challenges, the performance of the Vietnamese economy has been quite impressive in recent years, despite limited assistance from the outside world. This is largely due to the country's strong response to economic reform. Real GDP has been growing in the order of 8 to 9 per cent per annum in recent years. The consumer price inflation rate was brought down to as low as 10 per cent by the end of 1995 from 96 per cent in 1989 (and close to 500 per cent in 1986). Investment's share of GDP has risen substantially to around 23 per cent in 1995 from 12 per cent in 1990, while the domestic savings rate more than doubled from 7 per cent to around 16 per cent over the same period. Growth was led by capital construction (19.1 per cent), industry (13.5 per cent) and services (13 per cent). Growth in agriculture, forestry and fishing has also been positive, at more than 4 per cent, despite severe flooding in the country's main granary, the Mekong River Delta.

A review of the recent performance of the economy indicates that it grew by 9.5 per cent in 1995 and will probably maintain this trend for some years to come, with Vietnam's GDP expected to reach 25 billion dollars in

1996. Rice, the staple crop in Vietnam's rural areas, where more than 70 per cent of the population lives, is doing well. Rice production in 1996 is estimated to be around 26 million tonnes, up from 25 million tonnes a year earlier. Rice exports tend to continuously increase, now touching 2.5 million tonnes a year. The inflation rate has declined from 17.1 per cent in mid-1995 to 2.9 per cent towards September 1996 and the government has maintained a tight fiscal policy, keeping its budget deficit for the current fiscal year down to an estimated 1.5 per cent of GDP.

The value of Vietnam's overseas trade continued to rise markedly in 1994, with the value of merchandise exports growing by some 21 per cent to reach 3.6 billion dollars, while merchandise imports rose by an estimated 28 per cent, to 5 billion dollars during the year. As a consequence, the external current account deficit remained around 8 per cent of the GDP in 1994 and 1995.

According to official statistics, the cumulative value of approved foreign investment licences issued during 1989-95 amounted to some 18 billion US dollars. However, only one-third of the underlying capital has been realised so far, partly due to a cumbersome bureaucracy and the reluctance of foreign investors to place all the resources too soon. The sectors attracting most foreign interest so far have included hotels (20 per cent), light industry (16 per cent), heavy industry (14 per cent), oil (12 per cent), construction (8 per cent), agriculture and forestry (5 per cent), and export zones (3 per cent). The government hopes to attract some 30 billion US dollars of foreign investment to help finance its development strategy to the year 2000. This will require a much more substantive streamlining of foreign investment procedures and practices than has been the case to date.

Official Development Assistance (ODA) has also risen substantially since 1991. In 1993, the US dropped its objection to lending by the international financial institutions. Subsequently, the IMF and the Asian Development Bank cleared Vietnam's arrears and more resources are now available. A number of bilateral donors, most notably Japan, have also returned to Vietnam with substantial programmes. The November 1995 consultative group meeting of Vietnam's major donors resulted in pledges of some 2 billion dollars. This amount was slightly above the 1.95 billion dollars pledged at the 1994 donor conference. Vietnam hopes to mobilise and effectively invest a total of 7.8 billion dollars of ODA to help finance its development strategy during the five-year period up to 2001. In 1989, about 328 million dollars were disbursed as against

690 million dollars in 1995. In general, disbursements have averaged around 500 million dollars per annum in recent years. After 1987 external financial support was extended through the voluntary sector also. Presently, there are about 100 non-government organisations which are actively engaged in development work in various parts of the country and whose average annual disbursements are estimated to be 100 million dollars. However, Vietnam has yet to accept local NGOs or community-based organisations, but the voluntary sector is gradually growing.

On the basis of Vietnam's low income per capita alone (expected to reach 300 dollars GNP per capita per annum, in 1996, for the first time), the country could be considered a 'least developed country' (LDC), yet it has achieved a high level of social development. UNDP's *Human Development Report 1996*, records an adult literacy rate of 92.5 per cent, compared with 50 per cent for other LDCs. This is particularly noteworthy, given the shortage of teachers and the lack of pedagogical and physical facilities. The average life expectancy of 63 years is well above the 56-year average for all other LDCs, and infant mortality is encouragingly low at 38 deaths per thousand, in spite of limited access to safe water and an underdeveloped health care system. However, a full 40 per cent of children under 5 years are reported to be malnourished.

This performance is all the more remarkable considering that some of the most difficult decisions and adjustments took place during 1989-92, when Vietnam lost its dominant source of assistance and trade, the former socialist allies in eastern Europe and Soviet Union. The world economy was also stagnating at this time, and few Asian or western partners were present in Vietnam. The analysts say that Vietnam's open-door policy stems from this crisis period of the 1980s, when poor central planning, a war-torn infrastructure and declining Soviet support left Hanoi with few alternatives. But the fact is otherwise, as Dinh Hoang Thang, editor of Vietnam's popular *World Affairs Magazine* wrote: "Who opened the door? For many years the door was locked from the other side. The perceived threat of communism acted as a kind of security glue for most nations to help to hold the post-war capitalist system together, and reject us."

EIGHTH NATIONAL PARTY CONGRESS, 1996

Let us first look at how the party and congress work. The party is the only legal political body in Vietnam, and the congresses are key policy-defining events in its calendar, normally held once every five years. Work on the congress begins months, and

sometimes years, ahead of the congress itself, with the formulation of policy goals and directives by special commissions acting under the direct control of the inner politburo and the party's central committee. Views are collated from across the country and sent to the central committee, along with reports on local achievements and failings during the preceding five years. This feedback is then used to formulate a draft political report, which is published at least a month or so ahead of the congress, and remains open for debate and final suggestions from the public. At a closed door meeting, known as the 'pre-congress', just ahead of the congress proper, final differences are sorted out. This meeting of some 1,200 officials from all parts of Vietnam is one of the most crucial stages of the congress. The congress is the final ratification stage, during which, although congressional documents are voted in parts, consensus of opinion is considered a fundamental aim. At the end of the congress a final document, the resolution of the congress, is issued. This becomes Vietnam's policy blueprint for the following five-year period.

It is important to note that Vietnam has no single leader, but a collective leadership triumvirate. The top three positions are the Communist Party's secretary-general, president and prime minister. In practice, the party secretary-general is the country's top official. Of the three, the post of secretary-general is the only one formally voted on by the party's congress. Traditionally, the leadership trio has represented a balance of both north-south-centre regional differences, and conservative-centre-reformist political opinion. Elections to various committees of the politburo are held at the congress. Since 1982 a routine pattern has emerged in terms of membership of the central committee and other groups allowing one-third of the existing members to be replaced with new members. This is the most important process, as it must accommodate all factions and interests within the party and government.

For the eighth national party congress (ENPC) special commissions to prepare documents were established under the direct supervision of the politburo and central committee, who began their work sometime mid-1995. These commissions, as well as unpublished meetings of the politburo and special working groups, spent time sorting out goals and policy guidelines for a variety of issues. The result of these meetings was a trio of congressional documents: 'The Political Report of the Central Committee', 'The Report on Socio-Economic Orientation and Tasks for 1996 to 2000', and 'The Report on Amendments to Party Regulations'. The drafts of these documents were sent to nearly 40,000 party cells (grass roots units) for debate. Their opinions and

suggestions were consolidated by the central committee. Party cells also reviewed the work of the preceding period and submitted a report to the central committee. Through this process, a full draft of the political report was prepared and adopted on April 20, 1996, at the 10th gathering of the central committee, who were charged with that task. This document contained details of strategies and procedures to be followed, and allocated responsibilities and tasks for the party and government. It was then placed before the party Congress for discussion and adoption. These preparatory activities are fairly open, and even outsiders were generally allowed to join and observe. This characterises the rare political quality, and inner strength, of the party and its cadre.

To take part in the congress, the party invites key delegates from district level upwards. In addition, representatives from international communist parties and labour movements are also invited to attend. At the ENPC, 40 international participants took part. The presence of foreign delegates from non-socialist ruling parties at the ENPC reflected Vietnam's pursuit of an independent multilateral foreign policy. Heads of delegations from non-socialist ruling parties included senior representatives from Malaysia's UMNO, Singapore's People's Action Party and the ruling Servian Baath Party of Iraq. Foreign ministry official Hong Ha said, "188 parties throughout the world had requested an invitation but only 40 could be accommodated". Still, this party congress preserved a strong communist tradition in showing solidarity by inviting the communist states of Laos, north Korea, Cuba, Hungary, Bulgaria, and China. Representatives of communist parties from France, Russia, Japan, Belarus, Serbia, the US, and India were also present. Premier Li Peng, the vice-chairman of the Chinese Communist Party, headed the Chinese delegation. Li became the highest Chinese party delegate to attend a Vietnamese congress since 1960. In that year, Beijing sent Li Fu Zun, a leading politburo member and vice-premier, to attend Vietnam's third party congress. Li's presence revived a custom that had disappeared in the last three decades because of the strained relations between Hanoi and Beijing, and his presence enhanced hopes of socialist solidarity among the remaining communist states, with his saying at the Congress: "Learning from past experience is essential to the effort to help socialism improve economy in the future. If socialism is to survive then renewed efforts are critically needed at this juncture to build unity among us." Li Peng spoke highly of Vietnam's success during the renovation process and not only buried past strains in the Sino-Vietnamese relationship, but also implied a new

approach in strengthening that alliance among communist parties.

The ENPC came under intense scrutiny for a few predictable reasons. Firstly, with economic reforms gaining pace, questions were lingering in the minds of many—mostly westward-looking Vietnamese and foreign investors—observers: "Can the party preserve its monopoly? If so, for how long? What concessions will the party leaders make to maintain their pre-eminence in the government?". Concerns were expressed on the performance of the economy also. Vietnam posted a trade deficit of 2.3 billion dollars in 1995, and it is expected to exceed 4 billion dollars in 1996. The current account, a broader measure of trade in goods and services, posted a deficit of 2.6 billion dollars in 1995, and is estimated to increase to 3.5 billion dollars in 1996. That would be the equivalent of about 15 per cent of GDP, analysts argue, a little more than sustainable levels. The government has begun to take the trade-deficit problem seriously through measures such as restricting imports and local sourcing of materials by foreign investors.

Secondly, everyone sought information (even explicit commitment!) as to whether the present pace of economic reforms will continue. This discussion indirectly pitted 'reformists' against 'war-veterans', (generally represented by the army faction within the party, including those who had made immense sacrifices during the war, sometimes considered 'doctrinaire', whatever that term might mean within a socialist context), who felt neglected in the new era of economic growth. And finally, what kind of foreign policy did Vietnam expect to pursue in the future.

Speeches, resolutions and discussions at the congress were instructive, illustrating a wide range of experiences in genuine attempts being made to promote growth, redistribution and justice within the broad framework of market-friendly pattern of development. While reflecting the diversity of opinion, the congress contributed significantly to the understanding of the steps and instruments necessary to turn political processes into policies with increasing momentum.

In his inaugural speech, general secretary Do Muoi acknowledged the difficulties thus: "The work of building the Party and the socialist state governed by law and the consolidation of all the people in a united block, has made positive changes. We also understand our mistakes and weaknesses. Our country is still poor and underdeveloped. We have failed to practice thrift in production and consumption... On the whole, Do Muoi advocated more state ownership of public property, respect for the full autonomy of the business mechanisms, and the development of

effective social equity systems. He also stressed that the party should "pay more attention to the rural areas and working population". In some ways, he admitted that the party had gained an 'urban' outlook and a rethinking was needed.

Former secretary-general Nguyen Van Linh, the architect of economic reforms in Vietnam, was less cautious in his remarks. He addressed the congress thus: "A number of party cadres have resorted to corruption and they are protected by high authorities... For many years, we have been talking about the state economic sector playing the leading role in the economy, bringing the private capitalist sector under state control, developing a multi-sectoral economy with socialist orientations. See what we have achieved. Joint venture companies and 100 per cent foreign-owned enterprises do not allow the setting up of party cells or trade unions. Foreign firms pay less than local ventures... All these happen because the party has allowed itself to be ruled by the foreign investors. More people visit the pagodas than party cells. We have not just created differences in society but allowed it to become a norm."

In response to hardline rhetoric, General Vo Nguyen Giap, the military mastermind behind Vietnam's defeat of the French and later the Americans, added his voice at the congress to calls for greater caution in Vietnam's reform process. He said: "Ten years of the reform process proves that it is the right policy. I should say there are many more favourable conditions for us than in the past that allows us to consider appropriate reforms. But there are still many difficulties... We have carried out these changes at a pace determined by us. Our institutions did not collapse. In fact, they gained more strength... We are poor and face formidable challenges. These difficulties need not deter us from pursuing change. We will bring our workers into our fold. We will pay more attention to develop the rural areas. We are communists, we are pragmatists, we are optimistic. The first thing we will have to do is follow the cause of national independence and socialism. Second is to learn from outside. But we do it in Vietnam's way. We need not rush, and lose our sense of society and togetherness." The final resolutions at the congress were more direct, stating that the party would ensure the growth of state enterprises, continue social subsidies, provide public services and ensure fair economic growth so that the benefits reach all sections of society. The party not only agreed to make structural changes, but also political adjustments which would allow cadres to take more control of the situation.

One of the greatest challenges faced by the leadership, in summary, was how to

further develop the country and assure every section that the future course of socio-economic progress would be equitable and just. The main issue challenge which faced this year's congress was how a party founded on the ideology of Marxism-Leninism can adjust to the emergence of a private sector and free market tendencies, and at the same time control the impact of influences coming from abroad, including foreign direct investment in the private sector. Everyone had agreed that a development of the east European kind, with a rapid breakdown of the communist regime and a take-over by anti-communist forces, was unlikely to happen in Vietnam. The possibility of a forceful revolt against the leadership is remote, and they can count on the support of the army and a large part of the rural population. Based on past experiences, a careful loosening of the political system was expected by this group of analysts.

How would the party congress affect the foreign investor in Vietnam? For one thing, in the run up to the congress, the atmosphere was clearly one of reservation. Neither the investors nor the bureaucracy was keen to make a decision, or take responsibility for any decision. Many investors complained that the pre-congress period was a time of non-action by the government and "everything was put on hold". Despite the daunting task of defining what it means to build socialism in today's market economy, the CPV had dropped little hints about the future. Draft documents were circulated, showing that the economic reform process would continue, and that Vietnam would take determined steps to industrialise, and to maintain the dominance of state-owned enterprises. Such explicit statements did not convince foreign investors. They wanted more and more firm commitments from Vietnam.

One observes that the party congress was expected to correct various market failures and improve conditions for foreign investment. The pre-congress utterances by foreign entrepreneurs focused on some of the more worrying, nitty-gritty, drawbacks on investment promotion in Vietnam. This stems from a lack of understanding of the cadre-based party political process by the investors. There are types of policies that the party congress does not cover in any depth. There is little policy debate on issues such as improving the incidence of public programme benefits, reflecting a less than full appreciation of how economic behaviour, as well as resources and administrative capabilities, influence the performance of programmes designed to reduce poverty or increase foreign investments. The focus is primarily on formulating guiding principles for the party and the state, policy decisions which have traditionally been perceived to

be actually or potentially significant (e.g. the party congress excludes any discussion on laws or the enforcement of law).

Recognising the importance of SOEs at the congress, the party pledged to raise the state sector's share of the economy from about 40-45 per cent to 60 per cent by 2020. This proposal was criticised by many as a risky proposition, and was dropped from the congress document, but assertions were made that the state sector's leading role would be maintained. On the whole, it appears that the SOEs will transfer ownership to other sectors, especially joint ventures, when these new sectors grow sufficiently. Meanwhile, the party has agreed to maintain social subsidies at considerable levels and the government has introduced 'social taxes' to cover the cost of these subsidies. For example, the cost of a local employee with a take home salary of 1,500 dollars amounts to 6,000 dollars for the firm, in the private sector, which employs him/her. Investors consider it as 'punitive taxation' on foreign investors who employ local people. It also, they argue, reduces the country's labour-cost advantage. Foreign investors are working overtime to resist such regulations. However, the party has so far maintained its pro-worker and pro-social subsidies stance.

It is a significant point, that, while western nations tend to 'harass' China on the question of human rights, they do not question the record of Vietnam.⁴ And for valid reasons. Even the US limits its criticism to the so-called inaction of Vietnam on the issue of "full accounting for those *missing-in-action* during the war". Since the 6th national party congress, in 1986, limited liberty has been allowed, not only within trade and commerce, but also in art, culture, and in political and ideological debates. Visitors to Vietnam have been able to have frank political conversations with Vietnamese colleagues and friends who no longer repeat official views, but speak their own minds. At the same time, Vietnamese citizens have become bolder in their criticism of bureaucracy, corruption, abuse of power and mismanagement in the public sector. Doi Moi and Vietnam's increased contact with the outside world have reduced people's fear of the authorities and the party. Simultaneously, thousands of prisoners, who had been held in re-education camps in Southern Vietnam since 1975-76, were released in 1987-88. Despite some restrictions, there was no repression of the Chinese kind. Voices of dissent were allowed while administrative and judicial measures defined the limits. The new Vietnamese Constitution of 1992 recognised human rights and even began a debate with Amnesty International. However, the media/press is still not completely independent, but nor is it totally subservient. It is significantly freer

and more unconstrained than it was before 1986. An interesting feature is the fact that while the press is more free, publishing houses have to submit all manuscripts for approval before they are printed, and unauthorised literature may not be imported or disseminated. Despite this reservation, the book market has grown considerably since 1986. Imported and pirated video cassettes are available virtually in all towns, and one obviously hears about the infiltration of 'foreign' culture (this led to the 'social evils campaigns' which we will address later in this piece).

It will probably go down on record that the ENPC was confronted with the most dramatic development decisions, given the reality that the ruling Communist Party is still in transition. Preparations for the congress were launched in the most appealing way. As we noted earlier, the build up to the ENPC began sometime early in 1995 when Hanoi made preparations to celebrate the 20th anniversary in April 1995 of its victory over the US and allied forces which brought about the unification of south and north, forming one nation. The observance of that historic day was sober, yet emphasised some political realities. Hanoi released its official data on the suffering of the war years, which stated that more than one million North Vietnamese and southern communist soldiers were killed between 1954 and 1975, along with two million civilians. Significantly, the deaths of 2,00,000 South Vietnamese soldiers, most of them draftees, the 3,62,000 crippled for life, and the hundreds of thousands of widows and orphans, were left unmentioned. The lack of real national reconciliation was apparent. It is not difficult to understand why party stalwarts put so much emphasis on their military victory. The Communist Party is justifiably proud of its strategic brilliance, the heroism of its troops, and the immense sacrifices of the Northern Vietnamese people and southern communists. Moreover, the success of the party's struggle is its source of legitimacy.

The same concern for legitimacy also allows for party leaders, even today, to distance themselves from Vietnam's domestic business people. Foreign investors are always welcome, but local entrepreneurs are not encouraged. Some local economists say that this has led to many Vietnamese sitting on unbanked savings (estimated to be around two billion US dollars, while overseas Vietnamese may command many more millions of investible surplus).

Traditionally, it is the practice of party leaders to canvass opinion from its members. While doing so this time, party conservatives received some major shocks. Not only that members were asking for 'more democracy' but in certain areas common people criticised

the 'work of the party leaders'. Since Vietnam's economic success has spawned corruption, prostitution and bureaucratic red tape, and with the question of succession looming, the party now faces more challenges than ever. Many felt that the party's legitimacy was compromised by uncontrolled profiteering. This led to subtle, back-door discussions between conservatives and reformists, the instigation of prime minister Vo Van Kiet of a strategy paper on 'reforming the state' (August 1995) which sought fundamental changes in government-business relationships, and sought to distance the party from day-to-day government administration. Very probably this triggered a series of moves from the 'conservatives' who argued that accepting Kiet's plan would mean an end to socialism and the party. They also began to reinforce the party's control over the economy and state, the first signs of which were evident, when, early in 1996, Vietnam initiated a campaign against 'social evils' which was seen as a result of the conflict between reformists and conservatives in the Communist Party.

The 'social evils campaign' (January/March 1996) had three broad targets: trademarks and signs written in foreign languages; the improving of public morality (drive against 'spiritual pollution'), with the main targets being prostitution, drugs, gambling, pornography and other 'toxic cultural imports'. And lastly, the efforts to be made to rebuild a base for the socialist culture. Tens of thousands of pornographic or violent video tapes were confiscated, while hundreds of massage parlours and karaoke bars have been closed or severely restricted. Local level campaigns were promoted, with public bonfires of unsuitable video tapes, calendars, books, posters, etc. Party stalwarts maintained that there had been a deterioration in lifestyle in matters pertaining to social and cultural affairs. This campaign was also viewed by many as a shrewd move by conservatives to imply that social evils are a direct result of the reformers' deviant political line.

While the social evils campaign succeeded in placing the party's 'conservative' group ahead of reformists, it could not minimise debate on the 'corruption' in public administration. For some time now, corruption has become a common catch phrase across Vietnam, and to some extent has affected the party's past 'poor but pure' image. ENPC agreed that corruption is rampant and pledged to fight it. At the congress, many stalwarts angrily argued for stern punishment for those caught on corruption charges, when the government reported that about 17,000 economic crimes were detected in 1995 alone. Eliminating corruption is a daunting task, as it primarily

involves reducing a bureaucracy which provides ample opportunities for cadres to extort pay-offs with which to supplement their meagre official salaries. In early January 1996, a war veteran wrote in a local daily thus: "Most of us have at least 10 wounds, but none of them is as deep as the inner wound we feel now". The moral anger of the older revolutionaries and war veterans was most visible in the run-up to the congress, and party officials faced such charges with trepidation. Some officials present at the congress claimed that it was the involvement of powerful persons which prevents them from taking any action against corruption. "Many party members are virtually immune to any action. How can we root out corruption?" An official argued with disappointment and bitterness. The fact that debate on these issues began earlier, and, in fact, were discussed in detail during the first day of the congress, reflects the anxiety over the future among party leaders in both the conservative and reformist camps. Yet, neither the *Political Report of the Party*, submitted at the congress, nor government officials, had the courage to take up the corruption issue for a serious debate. Simply put, to deal with these issues the party leaders are living on borrowed time.

During the 1920s through to the 1940s the active party membership of intellectuals was common in Vietnam. This year's congress also confirmed a renaissance of the intellectual which began in 1986. For some time the events in China hardened the party in Vietnam while still allowing dissident intellectuals to be little active. In an effort to win over educated people the party launched a careful strategy. In public campaigns before the ENPC, the party promoted the wider use of a book and pen symbol, and introduced its cadre as follows: "...are 2,200 delegates representing 2.3 million party members. Among the delegates 270 will be women, 230 representing ethnic communities and 900 university graduates." At the congress itself, many statements were made to imply that the traditional peasant-worker alliance is now expanded to include the educated and intellectuals. For example, in his opening speech at the congress, party general-secretary Do Muoi stressed that education and training must become the basic building block of state policy, and that the party members themselves, special attention must be paid to education, training, and to raise their political acumen, revolutionary virtues and intellectual levels.

Many analysts argue that formal recognition given to educated persons is just an attempt to buy continued loyalty from those who have received a higher education, while projecting an intellectual face to the party, thus minimising direct criticism of its

policies and programmes. Debates among intellectuals acknowledge that the old cold war uncertainties have broken down, and the Vietnamese are rightly unsure as to what could replace them. Further, they are not clear as to how far they can go in trying out new ideas without provoking a reaction from the party's conservatives. All said and done, when meeting intellectuals in today's Vietnam one observes a mixture of ideological self-doubt and intellectual curiosity. They are less constrained about discussing themes that were considered taboo not so long ago. And at the party congress they played a crucial role in highlighting some of the important issues, such as levels of external borrowing, investment priorities, and general social concerns on corruption, among the party cadre and bureaucracy.

Dinh Hoang Thanh quite rightly said before the congress that "this congress is not about policy matters. Present policies will be continued in basic form. It is about leadership and the party's orientation. In that way this congress is different from the 1991 conclave when there was real uncertainty about which way Vietnam would go after the events in eastern Europe, and there were voices calling for multi-party democracy." It appears that, since 1986, the party has put in place a thorough screening system for its members. Nearly 80,000 members were expelled between 1987 and 1990 alone, and another 12,000 were reprimanded, up to early 1996, on various grounds, such as corruption, abuse of power or pursuing deviant political ideology (mostly those who showed some enthusiasm when the Soviet Union collapsed). In addition, the military's campaign for the party chief's position indicated that they were no longer content with the presidency, which had been filled by former General Le Duc Anh. The military argued that since they have important responsibilities they should also have some real power and the question was whether the military could impose its will on the rest of the party. The final leadership nominations to the party, involving extraordinary security precautions, showed that the legacy of Vietnam's martial history is as strong as ever. The outcome also demonstrated that the popular scheme, pitting hardliners against reformers, was somewhat overdrawn. The newly-elected 169-member central committee, which will be in power for the next five years, has 124 new members, many of whom have attained higher education. Only 15 per cent of the total are either party cadres or former military personnel. The party retained the troika: secretary-general Do Muoi, president Le Duc Anh and premier Vo Van Kiet. The addition of new blood in the party's top echelon is in keeping with its resolve to consolidate the state's control

over a market economy. The presence of this 'new blood' at the ENPC was obvious. The party chief, Do Muoi, 79, said at the congress: "Vietnam is being rejuvenated. Those who are younger will decide the future, and the old will return to the earth." Work was meticulously done to ensure that the new generation of leadership will continue to carry the torch of socialism, as the country moves into the next century with its reforms. Huu Tho, member of the central committee and editor-in-chief of the party's newspaper *Nhan Dan*, wrote thus: "One of the party's tasks is to properly prepare the younger generation for leadership positions. The second generation is prepared and in place, and we are working on the third generation now. There is no crisis of succession." He added: "The party is strong as ever. Therefore, we do not see a need to discuss on multi-party processes."

The ENPC came to a dramatic close with the eleventh-hour rejection of a proposal to centralise executive power in an elite five-member 'Standing Board'. Tran Trong Tan, former party secretary of Ho Chi Minh City, drew applause from fellow party members when he objected to the plan as 'undemocratic', just before the official closing session of the congress. His reservations won widespread support and the congress agreed to amend a clause in the party statute to ensure that the standing board did not become a 'superpower' authority within the party. Under the new arrangements, the standing board will serve as the party's secretariat, to run the day-to-day work of the ruling body.

Resolutions of the congress did not bring much cheer among the business community. For example, investors hoped for some changes in land use rights. The state's objectives – to maintain the people's ownership of land, reduce speculation, limit land loss [and ensuing poverty] by vulnerable groups, and avoid misuse of resources – were not appreciated by the investors. They argued that an incomplete regulatory framework has led to inadequate access to, and regulation of, land use rights. The difficulty is not that the government wants to maintain the ownership of the land by the people. National ownership of land on behalf of the whole population is practiced in many market economies without adverse consequences on enterprise development. Present ambiguities in the implementation of the land law limit, in practice, the availability and transferability of land use rights, which are considered as major impediments to business development. The party resolved to streamline procedures relating to land, such as transferability, land prices, registration and taxation, but no major concessions were made. The party also agreed to condense 'entry regulations' for new

investors. The party encouraged the state to establish and build constructive government-business relations.

Party leaders pointed out that cumulatively, disbursed foreign investment only amounts to about a third of all approved projects since 1988. For its part, the party restated that it is intent on improving the climate for foreign investment, and says the commitment drop-off is due to a more stringent screening of foreign investment projects. Government has made many amendments to address investors concerns. However, the thrust of the changes appear to be aimed at protecting domestic investors from having to compete with foreign investors. On such issues the party document argues thus: "We are socialists first and then only market-friendly policy-makers. We do not wish to be guided by the market in our policy-making." Such statements keep investors guessing but despite some misgivings, there is plenty of optimism and hope among foreign entrepreneurs and the business community appeared much relieved that the basics of the reform programme were left untouched.

In an interview with the popular monthly *Vietnam Economic Times*, Mathilde Genovese, a prominent business-woman said: "Investors, in general, are not concerned with the type of government in power. However, plans to establish party cells and party-controlled unions in foreign-invested enterprises does not sit well with us. Few would welcome their presence. For us it is an issue of economic survival. By keeping the party so close, I stand to lose confidential business information."

While western investors are still sceptical about the expanded role of the state in managing the economy, some Asian businessmen asserted that the capitalist economy model that Vietnam has adopted is one that has been used successfully in Thailand, Malaysia and Singapore, at the beginning of their development in the early 1970s and 1980s. "Thailand has allowed its state enterprises to grow first, particularly in basic infrastructure. Privatisation came about only in the last 10 years. Therefore, what is happening in Vietnam should be considered as normal and there is no need to exaggerate the monopolistic role of the party", one businessman from Thailand said in an interview to a local daily. Thus, the perceptions on the impact of the decisions taken at the congress differed among Asian and western business communities.

CONCLUSIONS

The progress which has been made in Vietnam since 1986 is impressive. This growth has not been generally acknowledged, as Vietnam has had bad press coverage in

the west for so long, and news reports have been biased against it. Despite such unfavourable publicity, a decade of economic reforms, put in place since the 6th national party congress (1986), has radically transformed a society which had endured years of rationing and economic hardship, and the party has managed well the economic advances made so far. The government has been successful in its first steps of transition to a market economy, despite limited external assistance. The second cornerstone is Vietnam's open-door policy. Scope now exists for the state to create more enabling policies to support dynamic public and private sectors.

The 7th national party congress (1991) resolved to combine the principles of the party with western ideas of checks and balances between separate units of the government, when it said: "The Vietnamese state represents the unity of the three arms of government – legislative, executive and judicial – with division of functions and devolution of powers while ensuring uniform guidance from the central level (i.e., the party)." The elections held in 1992 were not democratic but they rejuvenated the national assembly. While implementing the broad mandates of the party, the national assembly demonstrated its independence time and again (as was evident during the debate on the New Constitution in 1992). There were some genuine political discussions about important matters, and these days, the party provides less and less mandatory guidelines. The participation of national assembly members at the eighth national party Congress (ENPC) was purposeful and well thought out. The national assembly has gained immense self-confidence, and one expects that it will play a more positive role in the days to come.

Overall, the political report ratified by the congress in 1996 reflected the feeling that Hanoi was willing to experiment, learning from experience, with a more open-door approach. It is true that the congress did not make any dramatic changes, beyond introducing young blood to lower the average age of the central committee by two years, and committing itself to "bring rural areas into focus." As far as substance is concerned, continuation was preferred rather than proposing a 'turning point'. Personnel issues assumed priority at the congress, while substantive policy issues affecting investors were not addressed. The party did acknowledge this fact by observing that: "People are a little disoriented. Before we had a very egalitarian society. The recent changes have created different groups with varying incomes. People no longer know why they are." The underlying fear that the current social stratification of 'haves' and 'have-nots' runs contrary to traditional

socialist philosophy, carries with it the seed of instability and anxiety. These changes have also led to the gradual disappearance of a sense of solidarity that was once a defining part of Vietnamese life. "At least in the difficult times, no one was alone", observed the document. This collective disorientation, in some ways, has sparked a return to pagodas and churches. After years in which religious practices were rather neglected, more than 90 percent of Hanoians are back worshipping and the number of religious observers, a local analyst claimed, is highest among those with the largest incomes.

Evaluating the party's impact requires an assessment of how different the situation would have been in its absence. Vietnam's response to the threat it confronted in the 1980s was restrained and interestingly, most of the useful examples of adaptive response were self-inspired. Vietnam's experience also suggests a series of ways in which other developing nations should act to secure optimum performance. First, Vietnam has shown that external inputs, however massive, cannot effectively be utilised without viable indigenous institutions to carry out reforms. The survival of institutions which were built during the socialist regime was proven to be extremely valuable when reforms were undertaken. In response to foreign investments, the party and state stance has remained ambiguous. Second, the state was careful to lessen social costs of the reforms while maintaining a broader goal in mind, coping with the social devastation wrought by the economic crisis that gripped the country from 1975 through late 1986. Third, the party has carefully avoided mirror-imaging as a routine response to crisis situations. While one could question the role of institutions like the World Bank or IMF in formulating the economic reforms that began in 1989, it is obvious that they could not play a leading role in shaping the process of change undertaken by Vietnam. In hindsight, Vietnam attempted to go much further in shaping its economic policies than circumstances allowed. Further, experience in Vietnam shows that most state and party intervention will have to remain 'targeted'. Fourth the integration and co-ordination between party and state units has been effective in providing the necessary support to ensure that resources are optimally utilised. Fifth, the party not only allowed free debate on its policies and strategies, but considers dissent as part of its self-analysis and growth. The independent functioning of the national assembly and its discussions with human rights' organisations like Amnesty International are illustrative of this approach.

We began this paper with the objective of understanding the party's role in Vietnam's

transition and success. We found that the diversity of experience, the variety of institutions, and the great variation in policies that Vietnam has pursued has shown that efforts and initiatives were taken with a clear focus, commitment, and a willingness to learn. Broadly speaking, we have seen that the reforms initiated in Vietnam since 1989 brought with them, at least initially, economic growth without unduly disturbing national institutions. The common assertion that communism has been strongly biased against a market economy, with privileged policies, limited access to information, and so on, cannot therefore be seen as a characterisation of the most powerful strategies at work in Vietnam, on socio-economic change. In fact, the experience of Vietnam proves that institutions that were built on socialist principles and policies were powerful instruments in implementing economic reform and minimising the social cost of the crisis, with the poor being well protected during the implementation of the macro-economic stabilisation and adjustment programme, begun in 1989.

Of course, the trade against communism continues. Yet, despite this, a decade after the successful introduction of reforms in China and Vietnam and the somewhat less turbulent transition in former east European nations like Hungary and Bulgaria, there has been a modest revival of interest in 'socialism'. It has been stimulated by these surviving communist regimes, who not only have succeeded in reforming the state but also the party apparatus. It seems reasonable to surmise that an optimal mix of party and state control, and private sector development, dependent on a number of factors including the characteristics of the poor and country-specific circumstances, is the correct way forward for the socialist states. In general, the experiences of Vietnam has established that a combination of universalism in certain categories of party and state intervention, and a finer targeting of the private sector in others, will benefit society by maintaining social equity and balance. Such a two-pronged approach has proved to be a sound starting point for policy design, and in implementing it, Vietnam has ably confronted the challenges which have arisen from the confusion between the ends and the means of policy. It has also established that party and state control in development should be seen as a potential instrument, never as an objective in its own right.

Notes

[In preparing this paper, discussions with K P Kannan, Steven Lanjouw and Bernadette Roche were useful. Usual disclaimers apply. Various party documents presented at the

8th national party Congress were extensively used to prepare this paper. Some citations were quoted in *The Viet Nam News*, an English daily published in Hanoi. The monetary denominations are quoted in US dollars.]

- 1 Many commentators, rightly so, attribute the difference between Asian and European communism as an outcome of 'agrarian' and 'industrial' communism. Analysts do note that despite some difficulties, 'milder' forms of socialism in Hungary and Bulgaria have survived in Europe.
- 2 Contemporary studies on Vietnam are somewhat limited to 'war-related' themes. This is reflected in the popular perception that considers Vietnam as "a brutal jungle war zone".
- 3 Ever since 1955 the Soviet Union have extended aid to Vietnam, it has invested heavily in the basic sectors of the Vietnamese economy through 250 different projects, most of which were involved in energy-related sectors such as hydroelectric power generation or petroleum exploration. When the Soviet Union collapsed, the agriculture sector which used to depend on the import of more than 60 per cent of its fertiliser from the Soviet Union was the most severely hit.
- 4 Immediately after gaining independence Ho Chi Minh had recognised the need to allow freedom of expression. In an address to party members in 1960, he advised the members to work on making progress on the home front by pressing for democratic rights, such as freedom of the press and of assembly, and amnesty for political prisoners. He asked them to try to win over two categories of people they had not considered before: liberal or discontented persons, and small shopkeepers and entrepreneurs [cited in *The Vietnam Connection*, Isabel Molyneux, 1991].
- 5 Vietnam's national assembly approved a major cabinet reshuffle on November 6, 1996 removing 12 ministers and naming eight replacements in line with a proposal made by prime minister Vo Van Kiet. The reshuffle, which was made on the heels of the party's 8th congress in July, is regarded as a move to bring rising party cadres into important government positions.

How Important Are Changes in Taste?

A State-Level Analysis of Food Demand

J V Meenakshi

Food demand in India has been characterised by changing preferences. An analysis of state-level demand based on the linear expenditure system suggests that consumers are switching away from cereals toward the more expensive milk, poultry and meat products. This is consistent with dietary changes associated with economic growth the world over.

IT is now well established that per capita cereal intake in India has not increased despite increases in incomes and availability. Indeed, between 1972-73 and 1987-88, the consumption of cereals in urban India averaged around 11.2 kilograms per capita per month and that in rural India declined from 15.3 to 14.5 kilograms per capita per month. This decline is part of a secular change in the composition of the Indian diet: consumers—both rich and poor—are spending relatively more on the non-cereal foods such as milk and meat than on the cereals. Some authors have argued that such shifts in expenditure shares are not merely a reflection of increased prosperity: rather, food preferences have been changing over time. In a recent paper, Radhakrishna and Ravi (1992) demonstrate that taste changes were an important factor in explaining the decline in cereal consumption—accounting for nearly 17 per cent of the decrease in cereal intake in rural areas observed between 1972-73 and 1987-88 at the all-India level. In urban areas the corresponding figure is 8 per cent. But are these changes in taste occurring uniformly over the country? Or are there significant regional differences in the extent of change in taste? This paper attempts to answer these questions. It utilises a simple model of taste change, within a complete demand systems framework, to document the nature and magnitude of changes in taste among food items for the rural and urban areas of 16 states.

That there are important regional differences in food consumption patterns has been long-recognised. This is perhaps obvious, given the substantial cultural differences in the country. Studies documenting regional income elasticities of demand for food date back to the late 1960s (see, for instance, the brief review presented in Bhattacharya 1978). This recognition, however, has not typically been reflected in most complete demand systems for India. In part, this is due to the lack of data on commodity-specific retail prices at the state level. Recently, however, NSS-based price indices have been worked out by Tendulkar and Jain (1993) and Jain and Minhas (1991); these are used in this paper.

MODEL SPECIFICATION

The paper utilises the Linear Expenditure System (LES) to explore regional variations in food demand and to capture changes in taste. The LES is a popular demand system and has been widely used both in India (for example, by the Planning Commission) and abroad. Its principal advantage is its ease in interpretation, although it also makes some restrictive assumptions about the structure of underlying preferences.¹

The basic model takes the form.

$$\text{Model 1: } p_i q_i = p_i \gamma_i + \beta_i [Y - \sum_k p_k \gamma_k]$$

$$\sum_i \beta_i = 1, q_i - \gamma_i > 0$$

where p and q refer to prices and quantities, the subscript i denotes the i -th good; Y is total expenditure, γ is the subsistence parameter or the committed quantity and β is the marginal budget share.

Incorporating changes in taste in a utility-consistent manner can be done in several ways. Two of the more simple formulations are used here:

(1) Assume that the committed quantity is a linear function of time (denoted by t):²

$$\gamma_i = \gamma_{i1} + \gamma_{i2}t$$

Substituting in Model 1:

Model 2:

$$p_i q_i = p_i (\gamma_{i1} + \gamma_{i2}t) + \beta_i [Y - \sum_k p_k (\gamma_{k1} + \gamma_{k2}t)]$$

$$\sum_i \beta_i = 1, q_i - \gamma_i > 0$$

(2) Assume that the marginal budget share is a linear function of time (t)

$$\beta_i = \beta_{i1} + \beta_{i2}t$$

Substituting in Model 1:

Model 3:

$$p_i q_i = p_i \gamma_i + (\beta_{i1} + \beta_{i2}t) [Y - \sum_k p_k \gamma_k]$$

$$\sum_i \beta_i = 1; q_i - \gamma_i > 0$$

To incorporate regional differences a fixed effects model with intercept shifters corresponding to the various regions was estimated, both with and without taste change. A simple likelihood ratio test can then be used to determine the importance of taste changes and regional differences.

DATA

This study is based on the household surveys on consumer expenditure conducted by the National Sample Survey Organisation. The NSSO uses a stratified, two-stage sampling design; with villages or urban blocks selected in the first stage, and households in the second. The survey is conducted over four quarters or subrounds in the year, to minimise seasonal influences on consumption. In this paper, survey results for five rounds are utilised: 1972-73 (27th round); 1973-74 (28th round); 1977-78 (32nd round); 1983 (38th round) and 1987-88 (43rd round). These are published in various issues of the NSSO journal *Sarvekshana*.

For each round, information on average per capita household expenditure on various commodities is presented for between 10

Urban India:			
With regional dummies	-3207 (22)	*	*
Without regional dummies	-3756 (7)	-2377 (11)	-3001 (10)

Notes: The figures in the parentheses refer to the number of parameters

* Log likelihood values not reported as estimates are extremely sensitive to changes in starting values of the coefficients

and 14 income¹ groups in each state. The paper uses information on 16 states, which account for nearly 90 per cent of the country's population (in 1991). Thus for each survey year, there are approximately 150 to 200 observations, the total sample size for the five rounds is 1,053 for rural areas and 1,018 for urban areas.

To limit the number of regional dummies, the 16 states have been divided into six regions, based broadly on agroclimatic characteristics. These are: Northern—Haryana, Himachal Pradesh, Jammu and Kashmir and Punjab; Central—Madhya Pradesh and Rajasthan; Western—Gujarat, Karnataka⁴ and Maharashtra; Eastern—Bihar, Orissa and West Bengal; Southern—Andhra Pradesh, Kerala and Tamil Nadu. One state, Uttar Pradesh, is treated as a region in itself.

The study considers budgetary allocations of food expenditures alone, implying that the allocation of food expenditures is separable from that of non-food items. Within foods, a four-commodity classification is used: Cereals and cereal substitutes⁵; Milk and milk products; Meat, eggs and fish; Other foods. As noted earlier, the price data in this study are taken from state-specific indices computed by Tendulkar and Jain (1993) and Jain and Minhas (1991). Unfortunately, fractile-specific price indices are not available at the state level; in this study, therefore, people all across the income spectrum in a given year and state are assumed to face the same prices.

A non-linear maximum likelihood procedure is used for estimation, dropping the fourth commodity group: other foods. The computer package SHAZAM uses the quasi-Newton or variable metric method for estimating non-linear models. A convergence criterion of 0.0001 was specified in all estimations.

RESULTS

The log likelihoods of the estimated systems are presented in Table A. It is clear that in all cases, the likelihood ratio test argues strongly in favour of a model with regional specificity as well as taste change.

Given the evidence in favour of incorporating regional specificity, especially in the rural areas, separate demand systems for each of the 16 states, both with and without taste change were estimated. Table 1 presents the relevant log likelihoods.

Evidence for significant changes in taste, based on the likelihood ratio test, is found in most states, especially for the variant in which the marginal budget shares (β) are postulated to vary linearly with time. In rural areas, Model 3 has a significantly higher log likelihood than the static (no change in taste) version in all 16 states. In urban India this is true for 15 states—the exception being Tamil Nadu. The evidence is less-convincing

Notes: Figures in parentheses refer to absolute values of t-ratios.

for the variant in which the committed quantities (γ) vary with time (Model 2): it is preferred over the static version (Model 1) in 11 of the 16 states in rural areas and in seven states in urban areas. The exceptions are: Bihar, Orissa, Madhya Pradesh, Himachal Pradesh and Jammu and Kashmir for rural India; and Andhra Pradesh, Bihar, Haryana, Himachal Pradesh, Karnataka, Madhya Pradesh, Orissa, Tamil Nadu and Uttar Pradesh for urban India.

In comparing the two versions of taste change, based on the likelihood dominance ordering rule,⁶ it would appear that Model 3 does better than Model 2. Intuitively this is because Model 3, incorporating change in the marginal budget shares, has a higher log likelihood value with fewer parameters than the model with change in the committed quantity (Model 2).

The pattern of change in taste implies a consistent switch away from cereals over time. This is more apparent in rural areas than in urban; and more evident in marginal budget shares than in the subsistence parameters (Tables 2 and 3).

For Model 3, the sign of β_2 associated with cereals is negative and statistically significant in 14 rural states. It is positive but statistically insignificant in Orissa and West Bengal. Similarly in urban areas, the sign of β_2 is negative in 13 states (but significant in 9) and is positive and insignificant in Jammu and Kashmir, Maharashtra, West Bengal.

Where taste change is postulated to occur in the committed quantities (Model 2), the evidence is less unambiguous. As summarised below, the estimated γ_2 coefficient associated with cereals is negative in the rural areas of 11 of 16 states, and in the urban areas of 13 states. In most instances, however, the estimated coefficients—whether positive or negative—are insignificant.

It is perhaps no surprise that the relatively poorer states of Orissa and West Bengal appear consistently as those in which tastes have changed in favour of cereals. In fact, the poorest consumers in eastern India have increased their cereal intake over time – thereby representing a departure from the norm of decreased (or unchanged) cereal consumption in most other regions of the country. Increased incomes in these eastern states continue to be spent on the cheapest sources of calories: the cereals.

In many instances, the decline in the preference for cereals has been accompanied by a taste change in favour of milk and milk products, and meat, eggs and fish. Once again, the evidence is more compelling in rural than urban areas, and for Model 3 than for Model 2. The results of Model 3, for instance, suggest that the coefficient associated with β_2 is positive in 13 states (both rural and urban) for milk and milk products and in 12 rural and 14 urban states for meat, eggs and fish. There is no systematic pattern to the states which exhibit a negative trend coefficient in these commodities – a variety of economic and cultural factors may be at work. Although not all the parameter values are statistically significant, they are nevertheless indicative of a changing diet composition. In particular, consumers in all but the poorest regions of the country have substituted animal sources of nutrients for cereal sources. Thus the average diet is becoming more expensive.

What are the implications of these changes in taste for income elasticities of demand? Tables 4 and 5 present statewise elasticities for two commodities – cereals and cereal substitutes; and meat, eggs and fish. For the Linear Expenditure System the expenditure elasticity is given by β/w , or the marginal budget share divided by the (average) budget share, and is thus not explicitly a function of prices. The average budget shares are evaluated for 1972-73, the base year, at the all-India level, to ensure uniformity across states. For Model 3, the marginal budget share is evaluated at $t=5$ or 1987-88 (the elasticity retains the 1972-73 average budget share). It is thus best interpreted as the elasticity that would obtain in 1987-88 were only taste change allowed to occur.

As one might expect, elasticities vary widely among the states. Consider the elasticities for the static model (without taste change). For cereals, for instance, they range from a high of 0.69 in Bihar to a low of 0.26 in Punjab in rural India; and from 0.43 in Bihar to 0.18 in Punjab and Haryana in urban India. These are consistent with the magnitudes reported in other studies at the all-India level (for instance, Radhakrishna and Ravi). As one might expect the larger elasticities tend to be associated with the poorer states in

eastern India, and the lower elasticities with the richer states.

Similarly, the elasticities for meat, eggs and fish also vary widely among the regions: higher in the eastern and southern regions than in the others. In most regions, they are, as expected, greater than unity; and higher in rural than in urban areas. While the expenditure elasticities for meat, eggs and fish reported here are somewhat larger than those found in other studies, they highlight the consequences of further income growth. Because the cereals are also used as feedgrains for livestock, the indirect (or derived) demand for cereals is likely to increase much faster than the direct demand for cereals.

When taste parameters are taken into account, some interesting observations emerge. One striking finding is that despite the fact that Model 2 (where the committed quantities are function of time) has significantly higher log likelihood values than the static Model 1 in 11 of 16 states in rural India and 7 of 16 states in urban India, in practical terms, Models 1 and 2 are indistinguishable. While the statistical precision of the parameters is greater in the larger model in the 11 and seven states, respectively, the values of the parameters themselves do not show much change. The resulting expenditure elasticities of demand are virtually identical – they vary only in the second decimal place. Therefore if the interest of the analyst lies only in making demand forecasts, for example, then inclusion of taste change in the subsistence parameters does not matter much – one could just as well work with the more parsimonious model.

Of greater interest is the comparison between Models 1 and 3. In both rural and urban areas, the expenditure elasticity of demand for cereals is lower with taste change in the marginal budget share than without. The exceptions are of course states in which the changes in taste have favoured the cereals. The magnitude of the difference, however, is much larger in rural areas than in urban areas. In part this is because urban elasticities are typically lower than the rural, and in some instances are already as low as they are likely to get. For instance, in states such as Punjab, it is unlikely that the income elasticity of demand for cereals will fall much below 0.2. (In principle, it is possible for any expenditure elasticity to be driven to zero or even turn negative, but in a country such as India, a large commodity group such as the cereals and cereal substitutes is unlikely to acquire the status of an inferior good.) Analogously, expenditure elasticities for meat, eggs and fish are typically higher with taste change in the β_1 than without.

CONCLUSIONS

Food demand in India has clearly been characterised by changing preferences. These shifts appear to be better characterised by time-dependent marginal budget shares than by changing subsistence parameters. This is evident not only from the expenditure elasticities but also from the log likelihood values and the likelihood dominance criterion. The changes in preference appear to be in a direction away from cereals and toward the more expensive milk, poultry

and meal products. This is consistent with dietary changes associated with economic growth the world over. This implies that as the pressure on the direct (per capita) demand for cereals as food eases, indirect demand will increase, as increasing meat and milk demand exerts in turn a demand for cereals as livestock feed.⁷

In addition, the results indicate that incorporating regional specificity in demand analysis matters – ignoring it may lead to aggregation biases.

The Linear Expenditure System, on which both these conclusions are based, has some limitations, such as the linearity of Engel curves. More research is necessary on alternative functional forms, and different specifications of taste change, to establish the robustness of these findings.

Notes

[This study was supported by a grant from the Project on Strategies and Financing for Human Development. I am grateful to Monica Jain and Nisha Sinha for research assistance and to K L Krishna and an anonymous referee for useful comments. The usual disclaimers apply.]

- 1 Ranjan Ray and I have experimented with alternative functional forms for describing consumer behaviour in India. Our results, as yet unpublished, suggest that the linearity of Engel curves implicit in the LES is rejected by the Indian data in favour of its quadratic generalisation, the Quadratic Expenditure System. Also, the monotonicity in the relationship between income and budget shares implied in the Almost Ideal Demand System is rejected in favour of the Quadratic Almost Ideal Demand System.
- 2 There are, of course some disadvantages to using the linear time trend specification. It cannot be used over long time horizons, because it implies that changes in taste continue indefinitely through time, even if prices and expenditure remain constant. Also, if prices and expenditure remain constant, eventually the value of the committed commodity can exceed total expenditure.
- 3 The terms income and expenditure are used interchangeably. Strictly speaking, the NSSO provides no information on incomes, only on expenditures.
- 4 The inclusion of Karnataka in the western region, rather than the southern region has to do with the importance of coarse cereals (in both production and consumption) in this state.
- 5 Although there is evidence of commodity substitutions within the cereals, it is not possible to capture them here, for lack of state-level retail price indices for rice, wheat and other cereals.
- 6 Formally, the dominance ordering rule compares both alternative formulations against a notional composite. Specification 1 dominates Specification 2 if and only if (Pollak and Wales):

$$2 \cdot (L2 - L1) > [\chi^2(n3 - n1) - \chi^2(n3 - n2)],$$
 where L2 and L1 are the log likelihoods of the two alternative specifications; and n1, n2

and n3 are the number of parameters in Specifications, 1, 2 and the composite.

- 7 There is now a substantial literature on the likely increase in the indirect demand for cereals for use as livestock feed. While demand forecasts for feed cereals vary widely, there is certainly agreement that this component of total demand for cereals is likely to increase in importance. A good discussion of the issues is contained in Sarma (1996) and the references therein.

DISCUSSION

Maxi Devaluations and Contraction

Pronab Sen

I AM deeply indebted to Ravindra H Dholakia for his most perceptive comments 'Maxi Devaluations and Cooper's Hypothesis', *EPW*, November 23) on my paper 'Cooper's Contractionary Devaluation Hypothesis: A Note', *EPW*, July 27) on two counts. First, it is always gratifying for an author to have his work read and reacted upon by someone whose views matter. Second, for pointing out the limitations on the use of infinitesimals in analysing finite changes. Most theoretical economists tend to fall into the sometimes reprehensible habit of considering ϵ -changes from an initial equilibrium, which requires characterisation of the relevant functional forms *only in the neighbourhood of the initial equilibrium*. This would be unexceptionable if either of two conditions are met: (a) the functions are strictly monotonic in the relevant range; or (b) the changes being contemplated can reasonably be assumed to be relatively small. If neither is met, the results arising from the use of differential calculus in the analysis become suspect.

Dholakia's basic criticism of my paper is based on the suggestion that neither of the two conditions are met in the problematic that I have considered. In the first place, he correctly points out, a 'maxi' devaluation cannot be treated as an infinitesimal, or even a small, change by definition. In the second place, he asserts that imports and home-goods cannot be assumed to be 'gross complements' – which is the necessary condition for a contractionary devaluation – over the entire range of possible exchange rates. He demonstrates (*vide* the Figure of

his note) that if the 'Price Consumption Curve' (PCC) between home-goods and imports is "...a normal U-shaped PCC..." (i.e., the PCC is not monotonic), then there always exists some exchange rate at which the demand for home goods will not decline relative to the initial level (point E_2 relative to point E_0 in his Figure 1). Therefore he concludes that there necessarily exists some minimum devaluation beyond which "...home goods and imports would turn out to be gross substitutes foreclosing all possibilities of contractionary devaluation as per Sen's analysis" and that "...the concept of maxi devaluation is to ensure that [this] minimum devaluation..." is effected.

He further goes on to argue that "for Sen's conclusion to hold, however, it is necessary to impose further constraints on the nature of the preference function between the home goods and the imports so that throughout the whole range, the two goods turn out to be gross complements... This is the case of abnormal demand conditions in relation to the standard Marshallian conditions of normal demand..." He qualifies this rather harsh criticism by conceding that such "abnormal demand conditions" may obtain in small island nations, but not in other developing countries in general. Thus, in his view, contractionary devaluations, at least in the Cooper sense, are at best a *curiosum*.

While I readily concede the two basic criticisms of my analysis made by Dholakia, namely, (a) maxi devaluations are by definition large; and (b) the PCC may not be strictly monotonic, I cannot accept his conclusion that 'maxi' devaluations cannot in general be contractionary "...unless

In the interest of completeness it should be pointed out, however, that once the

First, at the theoretical level, it has been proved by W E Gorman in 1956 that consistent aggregation across individual preference functions requires that these functions should be quasi-homothetic, and that the resulting aggregate preference function would also be quasi-homothetic. Thus the aggregate demand functions obtained would generally display symmetry of the cross-price effects. This is one of the differences that arise between individual and aggregate preference functions. Second, at the empirical level, since home goods form an important component of national income, any reduced form demand function

for home goods which uses income as an argument will display strong heteroscedasticity and biased parameter estimates. These relationships can only be estimated directly from the structural equations. This problem is not faced in the case of the import demand function. Since the objective of my paper is to provide an a priori indication of the possibility of a contractionary devaluation so that an appropriate model can be devised for such cases, I feel that the approximation suggested by me may not be terribly objectionable.

Dholakia has also pointed out that it would also be necessary to estimate the export supply function in addition to the import demand function. This is obviously true. However, I again appeal to my primary objective of providing an indication as to whether a change in the basic IMF model structure becomes necessary to incorporate the possibility of contraction in order to justify not mentioning this. If the necessary

condition for contraction does not obtain, there really is no need to examine the sufficient condition. On the other hand, if the necessary condition is met, the full, and hopefully revised, model structure would doubtless take care of these other aspects.

Finally, I feel it incumbent on me to warn readers that Dholakia's critique of my paper contains a serious danger that needs to be guarded against. Since it is very difficult, if not impossible, to estimate the relationship between imports and the home goods over the entire range of possible values for a number of reasons, some of which have been mentioned by Dholakia, it is entirely possible that any devaluation which is found to be contractionary in an *ex-post* sense can be considered to be insufficient by Dholakia's logic. This may then set off a chain of further devaluations in search of the elusive bluebird of gross-substitutability which may never be found, and the country would have paid a dear price in the bargain.

advantages, the bourgeoisie's commitment to parliamentary democracy is not, however, absolute. When class-conflict develops, the bourgeoisies find parliamentary democracy a dangerous liability, and prefer a strong executive.

Marx argues that the dominant class controls the state in various subtle and not so subtle ways. The state needs a steady supply of money, and this enables the dominant class to manipulate it by such means as withholding taxes, speculating on the state bonds or the national money. The dominant class also controls the state ideologically. It "absorbs the branches of labour directly belonging to the state", such as the army, the civil service, the judiciary, the executive and the legislature. The legislature for example, consists principally of the representatives of the dominant class, and has no real interest in curtailing its power. When it makes laws to limit its power, it leaves 'loopholes' which the dominant class knows how to exploit. When violations of laws are reported to the judiciary, whose procedures and criteria of evidence are biased against the dominated class and where 'the masters sit in judgment on themselves' the outcome is more or less predictable. (Marx called 'ambitious professors, lawyers and similar persons' who make 'a lucrative business' of selling their services to the state, 'literary lumpen proletariat'. The dominant class also controls the 'ideological estates', such as academic, legal, journalistic and other professions.

'Oppression' and 'authoritarianism' are the words used by Balagopal in an abstract form to justify his argument '...history is witness to innumerable instances where those who have fought authoritarianism that oppressed them have themselves turned authoritarian thereafter, for what they have fought is not oppression *as such* but the oppression of the other that has hurt their interests" (p 59). If the above passage refers to erstwhile socialist societies, it is not relevant to this debate. Coming to the Indian context while the 'authority' and 'oppression' rests in the hands of landlords, upper castes and classes, cunning politicians, mafia gangs and boot-licking bureaucrats and men in male-dominated society, people who are being oppressed forge their own weapons of resistance and rationalisation to dismantle the existing structures of power. In this context where does the democratic rights movement stand? It should think whether it is to align with the people or with the ruling class which protects the status quo. In a broader perspective, to think that the Indian state through its arms - legislature, executive, judiciary - provides 'democratic space' to its citizens is a myth. 'Democratic space' is always enjoyed by the ruling classes, which have differences of their own in the matter of grabbing power and wealth. But the masses do not really enjoy the 'democratic space' as long as the present nexus of criminal-politician-bureaucrat-industrialist continues.

'Of Bourgeois Democracy' and Indian Reality

V Subramanyam

We know single science, the science of history

—Marx.

THIS is in response to K Balagopal's rejoinder (*EPW*, January 7, 1995) to Sumanta Banerjee's 'Sangh Parivar and Democratic Rights' (*EPW*, August 21, 1993). After reading the other rejoinders (May 20 and 27, October 28, November 4, December 9, 1995 and March 30, 1996) I am tempted to write this piece. It is clear that the democratic rights movement is not above politics or distant from politics or 'neutral' between Right and Left. But the crux of the issue is whether it serves the interests of ruling class or the interests of the people. There is nothing beyond these criteria.

To understand social reality one should ponder over the historical developments that took place in several stages from slave-owning democracy to semi-feudal democracy in the Indian context. Based on this premise only one can arrive at the right conclusion. But the method Balagopal employed in the entire article is nothing but a declassing, dehistoricising and depoliticising of the ideas.

While Banerjee demanded a denial of rights to the Hindutva forces (from saints to sainiks) in the context of pogroms, Balagopal de-contextualised the entire issue and went on arguing to defend his 'fresh look' in the garb of 'bourgeois democracy' and its 'institutions' and their 'limitations'. One wonders whether he is advocating the

colonial legacy which is being practised by the different arms of the Indian state - legislature, executive and judiciary? He refers to Marx to strengthen his argument by quoting "...nevertheless each such right expresses a value that is as much a lasting resource of human civilisation as the steam engine that Marx was immensely impressed by". But we should remember that Marx understood the limitations of bourgeois democracy and wanted society to go beyond it.

As Hal Draper² rightly observed:

It is true that Marx's thinking began with the basic framework of bourgeois-democratic ideology; it is also true that this bourgeois-democrat began his career by publicly blasting the specifically bourgeois approach to democracy on the free press issue.

The characteristics of the bourgeoisie that Marx brilliantly analysed, which is still relevant to the Indian political situation, is summed up by Bhikhu Parekh:³

...the bourgeoisie, although not committed to any specific form of government, generally find parliamentary democracy most conducive to their interests, at least in their early years. It enables them to control the executive and to influence its policies. It eliminates arbitrary rule, and ensures a stable orderly government. It enables the various factions of the bourgeois class to bargain and reach a compromise; at least, it prevents one of them from acquiring dominance. Finally, the parliamentary democracy enables the bourgeoisie to cloak their class-rule under the thick ideological veil of democratism. Despite all these and other

Before we proceed to understand the democratic rights movement, it is precondition to know under which type of state we are being governed. Randhir Singh⁴ lucidly analysed the character of the Indian state:

It is not seen that the Indian state does not merely happen to be violent or repressive, it is inherently so, by virtue of the society it presides over; it guards and keeps going, violently if necessary, an inherently violent society because it is a society of myriad economic, social and cultural oppressions.

Generalising the entire communist movement and indicting it he affirms "And the communist parties that substituted themselves for the proletariat have made a mess of the job, at enormous cost (p 60), whichever way they tried, the Stalinist way, the Maoist way, the Titoist way and even the Sandinista way" (italics are mine). But in reality in the days before the revolution the Czars, big bourgeoisie and the ruling class amassed millions at the cost of poor people's obedience and passivity. And the bourgeoisie always deplore the violence, the disruption involved in any revolution. They are meticulous in their calculations of the 'human cost' of revolutions. Their newspapers always make up the wildest estimates of the supposed numbers of people who are slain in the course of revolution. But they are reluctant to see the hideous tyranny of their own.

Felix Green⁵ in his in-depth study observed boldly, how the 'human cost' or 'enormous cost' (in case of Balagopal) was greater when there is no revolution:

Before China's revolution at least a million people, on average, died every year of starvation. The International Red Cross reported that every year in Shanghai alone over 20,000 bodies were picked up off the streets—people who had just gone under. Millions of Chinese lived so little above the biological level of survival that their bodies were permanently stunted and there was no hope for them of anything but a lifetime of sheer toil and pain. This was the 'human cost' that endless generations suffered for *not* having a revolution. Today, no one starves in China, no bodies are picked up off the streets; there are no beggars, everyone has work, bodies are healthy, the expectancy of life is extended; opportunities for exercising skills and talents are open to everyone, the dark days of illiteracy are over forever. And in Cuba the same. When on one occasion I asked Mr Nehru why he did not mobilise for socially productive purposes the prodigious wealth which is still owned by the upper classes of India, he replied that this would mean struggle, violence even, and he wanted to bring about necessary reforms in a 'democratic' and 'non-violent' way. A classic bourgeois answer! But what about the violence, the unseen violence, of the huge human misery within India? What about the 5,00,000 Indian children who it is estimated die every year through lack of

food? This, in the bourgeois mind, is not considered 'violence', but what is mass starvation if it is not bloodless genocide? But the bourgeoisie do not calculate the mathematics of suffering in this way.

Personal affection is different from ideological opposition. In this debate rejoinders like Vindhya's (October 28, 1995) mixed these two elements and narrated irrelevant happenings, which occurred in Andhra Pradesh. Personally, Balagopal is being admired still by everybody but in the recent past due to his ideological doldrums the opposition is growing on an ideological plane, which is quite natural. This should not be misinterpreted.

Balagopal by condemning every argument of Banerjee's in black and white, argued like a mercenary lawyer, whose object is to defeat the other's logic. In the course of his argument he has made many fraudulent generalisations. One such is "...that all the communist revolutions have achieved in this century is the discovery of a rather crude and ungainly road to capitalism or rather, neocolonial subordination—*which state India has any way reached by a more civilised route*, (italics mine) and therefore there is no reason why the naxalites should be allowed the freedom to take a lot of lives and impose upon this country an authoritarian government..." (p 58). What does he mean by 'civilised route'? Does he mean that the imperial rulers who minted millions by the blood and sweat of the toiling people were civilised? Or the Indian ruling class who are neck-deep in scandals and perpetual exploitation are running the Indian state on a 'civilised route'? In one way or the other Balagopal is defending the ruling class ideology in that statement. In the 1950s Ram Manohar Lohia⁶ brought out brilliantly, how the Britishers protected through their policies the interests of the affluent minority during their regime and threw the majority into bondage and the same legacy was being followed by the Indian ruling classes.

Two or three lakh persons grow rich every year. It is only effect of Five-Year Plans and a major portion of the increased national income is siphoned off for that purpose. In my opinion (Lohia) there are 50 lakh rich people at the moment and three lakh people are becoming rich every year. During the last 12 to 15 years three lakh people have become rich. The British government functioned with the support of three lakh people and the present government is run by 50 lakh people.

When Balagopal says "struggle against oppressive social structures, and the reconstruction of society on the basis of co-operative and egalitarian relations are evidently linked not through the *dictatorship of the last victors* but through the *cultural possibilities opened up by the successive struggles* and there is no last struggle, nor

a millennial victory" (italics mine) (p 60). It seems he on the one hand appears to belong to the cultural Marxist school of thought of 1920s, 1930s and the New Left of 1960s, and on the other Surrealist school, those who studied exclusively late capitalist society. But Balagopal should recognise that "Marx sought to unite theory and practice, to reconcile thought and feeling, to overcome the separation between the personal and the political, but his original emancipatory thrust had been abandoned or diluted by most of his followers, who had reduced the complexity of his thought to a crudely mechanistic economic or sociological determinism".⁷ Balagopal's confusing, confounding, conflicting statements only show his penchant for journalistic writing. No thinker or theoretician or ideologue argues or abuses words in such a way and makes a mess of it.

Finally, in the era of globalisation, in which seams are the order of the day, all the governments and their institutions have imposed the rules of the game to suit their selfish ends. Given this situation, the democratic rights movement also should take the side of emancipatory politics.

INDIAN COUNCIL OF SOCIAL SCIENCE RESEARCH

Grants for Studies on Indian Diaspora:

Indian Council of Social Science Research (ICSSR) invites applications from Indian Social Scientists for field work abroad for studies on Indian Diaspora.

The grants will be given to one senior scholar and one junior scholar (Post-doctoral level).

ELIGIBILITY

- A. Grants to the senior scholar will be given on the basis of his published works which include books and papers in professional journals.
- B. Grants to the Junior scholar will be given to young social scientists on grounds of competence for research work and Ph.D or an equivalent research study of merit.

DURATION

The duration of the visit abroad will be for a maximum period of three months.

FINANCIAL ASSISTANCE

The scholars will be entitled only for per diem at the permissible rate of the ICSSR and to and fro international air fare (excursion).

HOW TO APPLY

The applicant should submit four copies each of their detailed bio-data and research proposal up to 3000 words neatly typed on A'4 size paper. The proposal should also contain a note on the workplan in the country to be visited.

The last date for submission of the applications is one month from the date of its publication. Kindly send your applications to Member-Secretary, Indian Council of Social Science Research, Post Box No. 10528, Aruna Asaf Ali Marg, New Delhi-110067.

CHAMPION LIFEBUOY

Where there's Lifebuoy there's health. It washes away all the germs in dirt — to give you that clean, healthy feeling that comes only with Champion Lifebuoy. Now with a modern, new look.

WHERE THERE'S LIFEBUOY, THERE'S HEALTH

YOUR FOUR-WAY OPTION WITH IDBI'S FIXED DEPOSIT SCHEME*

TYPE	MINIMUM DEPOSIT	YIELD STRUCTURE
Monthly Income Option	Rs. 18,000	Rs. 210 every month on a 5 year deposit of Rs. 18,000
Quarterly Income Option	Rs. 10,000	Rs. 350 every quarter on a 5 year deposit of Rs. 10,000
Lumpsum Discounted Interest	Rs. 10,000	You will get Rs. 4,806 immediately on a 5 year deposit of Rs. 10,000
Cumulative Option	Rs. 10,000	A Rs. 10,000 deposit becomes Rs. 19,898 in 5 years.

*Interest up to Rs. 1,500 on the above deposits is tax-exempt under Section 80L of the Income Tax Act, 1961.

MINIMUM DEPOSIT : RS. 10,000

Beyond the minimum amount, you can deposit in multiples of Rs.1,000. The base interest rate for a three year deposit is 13.5%. And a deposit period of

five years
and more fetches
a base rate of 14%.

What's more, this deposit comes with the guarantee of India's premier development bank - IDBI. Reflected in the CARE AAA (FD) rating by CARE and the FAAA rating by CRISIL given to this product indicating the highest degree of safety. Naturally, an organisation that has total assets of over Rs. 40,000 crores can take very good care of your investment. For more details contact your nearest IDBI office or any authorised IDBI agent.

This opportunity is open to : * Resident Individuals
* Hindu Undivided Families * Partnership Firms
* Companies/Bodies Corporate/Societies
* Trusts /Association of Persons.

Private Schooling and Equity

Official school enrolment statistics in India – on which analysts and policy-makers rely – apart from being gravely inaccurate, are seriously skewed: they exaggerate the size of the free, government-funded elementary school sector and greatly understate the size of the private fee-charging sector. The fast-growing role of unrecognised private elementary schools must not be ignored: a system where fee-levying institutions have a significant role in elementary education while secondary education is largely state-supported has perverse equity effects. 3306

Self-Respecters' Tamil

The politics of the Self-Respect Movement in Tamil Nadu around Sanskrit and Tamil may be viewed as a search for a unified language of the nation. The search was marked by new ways of interrogating and reconstituting relations of authority and subordination in Tamil society. It held out, as a consequence, possibilities of forging a broad historic bloc with the agenda of reordering the society on a democratic basis. 3323

Women's Work and National Accounts

Much of the work of women, particularly that of household women which forms the major part of household non-market production, goes unreported in the accounting framework of the System of National Accounts. How does the SNA 1993 fare in terms of capturing the activities of women in the estimation of domestic product, measuring housewives' services in the concept of Extended Net Domestic Product and estimating the share of women in Extended NDP? 3330

LNG Lobby

The current intense lobbying for basing a part of the power programme in India on liquefied natural gas (LNG) has to be seen in the context of the worldwide slow-down in demand for LNG. The over-capacities among most large producers of LNG has prompted a desperate search for new consumers and India appears to be succumbing to this international pressure. 3284

Land Alienation

The prevailing economic climate, new government incentives for agro-based investment and the fashionable discourse of environmental protection have combined to produce a wave of investment in tree plantation schemes in the rural areas of Tamil Nadu. But where are the large blocks of land for these schemes coming from? Who is giving up their lands for the benefit of these investors? 3291

Misdirected Subsidy

Electricity tariff for irrigation pumpsets has proved to be one of the most controversial issues in power sector reform. A study in Maharashtra, however, shows that the distribution of the subsidy on power tariff for irrigation is highly skewed and suggests a case for a consumption-based tariff instead of the present flat tariff as well as for a tariff hike. 3315

Victimising the Victim

Official discourse on prostitution in India reveals a disturbing ambivalence towards the practitioners of the profession, resulting in the prostitutes being further subjected to demeaning treatment at the hands of the state apparatus. 3298

Health Care and CPA

The Consumer Protection Act can effectively protect the rights of health care consumers only if the agencies set up to process grievances can be made to function efficiently. 3289

Right to Information

The Right to Information Bill drafted by the Press Council is a step in the right direction and merits close study by the media and wide public discussion. 3283

Bihar's New Rulers

The Bihar countryside has undergone tremendous change in the last three decades. The landed classes of the past have given way to a combination of groups who constitute the new ruling class. A new form of exploitation has been superimposed on the old which directly uses the state agencies to consolidate its power. 3287

India-Pakistan People's Convention

TWO-AND-A-HALF years ago some of us in India and Pakistan found ourselves in agreement that nearly five decades of strained relations between our two countries had only served to inflict severe damage to both our peoples. Economic as well as social indicators provided telling evidence that we had fallen far behind some other countries which were no better placed than ourselves to begin with. Since our respective ruling elites seemed unwilling to move out of set moulds, we felt that the only available course was for the people to assert themselves in favour of peace and friendship.

The first step that we took was a meeting in Lahore in September 1994 where the People's Forum was formally set up. It was agreed there that the political issues that had bedevilled relations between the two countries should receive prime attention. Further, it was felt that the voices of the people would carry to the decision-makers only if there was responsive democracy in both countries. Consequently, peace and democracy became interlinked in our objectives.

Two large conventions have by now been held, one in Delhi in February 1995 and the other in Lahore the following November. The 400 or so participants in these from the two countries came to unanimous conclusions on many contentious issues. For instance: (1) There should be no resort to war. Force levels should be reduced on both sides by 25 per cent over three years, simultaneously curtailing military spending. Both sides should step back from the nuclear brink. (2) Kashmir is not merely a territorial dispute between India and Pakistan, but concerns the lives and aspirations of the people of Jammu and Kashmir on both sides of the Line of Control. What is required is a peaceful democratic solution which involves the aforesaid people.

(3) Both countries must reduce the oppressive role of the police and the military in dealing with democratic movements, and protect the common citizens.

(4) Trade relations must be formally recognised and enhanced.

(5) Both governments must lift visa restrictions so that citizens of the two countries can travel freely.

We are well aware that this is only a beginning. Although the two conventions have helped to spread the message of peace and democracy in both countries. Regional groups on both sides have been busy organising local meetings and have received highly encouraging responses. The India chapter of the Forum held a well-attended National Conference in February 1996 in Delhi, where strategies to disseminate the conclusions of the two conventions were discussed.

The Forum is now organising a larger and longer Convention in Calcutta on December 28-31, 1996, which is expected to be attended by up to 250 delegates from each country. We expect that the forthcoming Convention will generate further support for the Forum's objectives, and hopefully influence the policies of the two governments towards peace and democracy.

Arranging the proposed Convention is going to cost a great deal of money. The Forum is a wholly non-governmental body, and is funded entirely by contributions from its members and sympathisers. Its accounts are regularly maintained and audited. We need your support and help. Please donate as generously as you feel moved to, having regard to the cause you will thereby further. Donations may be made by cheques or bank drafts drawn in favour of 'The Peace and Democracy Trust', K-14 (FF), Green Park Extension, New Delhi-110016.

Ambedkar and Gandhi

SUHAS PALSHIKAR's paper 'Gandhi-Ambedkar Interface' (August 3) is scholarly and provoking. An array of equally forceful arguments could be presented to rule out the question in the subtitle of his paper 'when shall the twain meet?'

Gandhi and Ambedkar should be seen in the first instance as the products of wholly different circumstances. Apart from different family and social upbringing, Gandhi was mauled by White racism in South Africa,

Ambedkar by Hindu racism which he saw as divinely sanctioned. Their further development evolved on the basis of their emotional make-up and intellectual acumen. Gandhi wielded great emotional power, while Ambedkar displayed intellectual strength for which Gandhi was no match.

To cite an old example, Gandhi could not meet the case for 'Annihilation of Castes' (1936) so convincingly argued by Ambedkar, and was not able to give anything more than a feeble, evasive reply. No worthy reply has come from any of the so-called Gandhian intellectuals since then to this day.

Intellectual Ambedkar would not let him accept everything in Buddhism that he embraced. He came up with his own version 'Buddha and his Dhamma' (1957). It was denounced by purists in Buddhism, particularly the Theravada Buddhists. Gandhi did not live up to Ambedkar's Buddhism. Rajaji, a close follower of Gandhi, was so unforgiving and uncivil even at Ambedkar's demise as to remark that Ambedkar's conversion to Buddhism was more anti-Hinduism than an acceptance of the doctrine of compassion and rectitude that Buddhism was. Palshikar has studied Ambedkar's Buddhism and has made some pertinent points. For instance, he says: "... he [Ambedkar] tended to take the view that concentration of wealth and exploitation gave rise to 'dukkha'. His conception of dhamma makes it clear that Ambedkar made a distinction between material well-being and insatiable lust". It is heartening that Ambedkar is getting the attention he deserves from academic circles.

Palshikar's paper was presented at a seminar 'Gandhi's Relevance to Contemporary Theory and Politics' at the University of Pune last October. It would be interesting to know the comments of the participants at the seminar

Surrender at Singapore

ONCE again, despite its prior protestations to the contrary, the government of India has caved in to pressure at international economic negotiations. The Indian delegation to the Singapore WTO Ministerial Meeting has come back having conceded much that it had earlier sworn to defend, and having got virtually nothing in return. The developed industrial countries, led by the US and supported by the European Union, were successful in most of their aims in terms of pushing their own agenda, and developing countries were either bought off by side agreements (such as the Information Technology Agreement) or simply pressurised to fall into line.

The first success of the developed countries was that they were able to relegate to the background the issue that should have been the primary focus: the assessment of the functioning of the WTO thus far and the implementation of the Uruguay Round agreements. In this area, developing countries had a number of very valid concerns, because many of the hopes raised by the signing of the Uruguay Round agreements have been belied by actual experience. To begin with, the Uruguay Round was heralded by observers as marking the beginning of a massive boom in world trade. But in reality, world trade has consistently decelerated since January 1995, when the WTO was formed, despite a recovery in world output growth. In addition, despite the Agreement on Textiles and Clothing, protectionism in this sector by industrial countries has actually increased significantly since 1994. Developing countries continue to face inadequate market access for their agricultural exports despite the explicit provisions of the Uruguay Round. The skewed nature of the TRIPs agreement has reduced the scope for technological innovations in developing countries and made them dependent upon large international players. The limits put on government subsidies have conflicted with national interest especially in the matter of food security; and the numerous other constraints on domestic economic policy have severely limited the ability of developing countries to design relevant policies with any autonomy.

The final declaration did pay lip-service to some of these concerns, but it made absolutely no commitment of content and gave developing countries no grounds to believe that any of these matters would be resolved to their satisfaction. Instead, the agenda that was being pushed by the US and the EU loomed large in the actual result. This consisted almost entirely of 'new' issues, which involved a further opening of international markets, especially in developing countries, greater freedom to large capital for investment and operating decisions and also an excuse for protectionist measures through the introduction of 'core' labour standards. In addition, the US came to the conference determined to push through an agreement on information

technology which it had already managed to establish in the APEC a month earlier.

In fact, pushing through this Information Technology (IT) Agreement, which will eliminate tariffs on products such as semiconductors, telecom equipment, computers and computer equipment and software products, was a significant achievement for the US, especially as it meant opening up the largest and most protected market for such goods, the European Union. This agreement was formally endorsed by 28 countries representing 85 per cent of global trade in such products, and especially by Asian exporters who account for a major share of this trade. Items of Indian export interest were not included in the pact, being judged insufficiently important globally, and the Indian delegation therefore could not be part of this agreement.

With this under their belt, the industrial countries then introduced the very issues which the developing countries, including the Asian countries and especially India, were earlier determined to resist. Thus, the "observance of core labour standards" was explicitly brought up. It is true that the statement mentions that these should not be used for protectionist purposes; nor should the comparative advantage of low-wage developing countries be put into question. But the very inclusion of this in the WTO statement at all is the thin end of the wedge in terms of allowing labour standards to influence trade policies, and will certainly become more of a weapon in subsequent negotiating rounds.

Similarly, the Singapore Declaration also incorporates the US demand for a policy on government procurement, which will militate against any preferential treatment by a government in procuring even from its own public sector enterprises *vis-à-vis* foreign suppliers. Currently this is in the form of a working group to 'study' the issue (a standard WTO euphemism for preliminary negotiations) which is likely to culminate in yet another sweeping agreement.

But the most significant defeat for developing countries, including India, relates to the inclusion of discussions on investment within the framework of the WTO. The Singapore meeting agreed (as usual, through ultimate 'consensus') to establish two working groups, one on the relationship between trade and investment and the other to study the interaction between trade and competition policy, including anti-competitive practices, "in order to identify any areas that may merit further consideration in the WTO framework". This inclusion of investment in particular, given the context of OECD negotiations over the Multilateral Agreement on Investment and the WTO's own very one-sided recent report on this matter, is dire to say the least. The Indian delegation has tried to hide from this unpleasant implication by pointing to the

escape clause, which says that future negotiations on these matters would require explicit consensus among WTO member countries. But this clause is unlikely to prevent eventual WTO assimilation of the investment issue, since the recently issued WTO report is blatantly in the interests of large capital, and it is evidently quite simple for the US and other industrial countries to push through a 'consensus' on previously unwilling nations, through a combination of carrots and sticks. As a result, the issue is now firmly on the agenda for the next WTO ministerial meeting planned for Geneva in 1998.

The poor bargaining ability of our trade negotiators does not really reflect their own inadequacies; rather it is a result of our domestic policy framework which leaves them with little alternative but that of accepting the fundamental rules of the game while trying to tinker with a few minor clauses. Unlike China, India has never been able to use the fact that it is opening up a potentially vast market for foreign capital, goods and services, to its own advantage as a measured bargaining counter. And this in turn is because this government, like its predecessor, has never considered withdrawal from the WTO as an option even as a bargaining stance, and has never tried to work out how far the WTO rules accord with a desirable pattern of development for its own people.

Yet, for the interest of India's long-run development to be truly served, the government and citizenry should be allowed to debate seriously the issue of WTO membership, weigh the advantages of being in the WTO against the costs, and to consider how best the costs can be reduced. For this to happen, the government's economic policy in turn must be oriented not towards the aspirations of a small elite, but the more basic concerns of survival and material improvement for the vast bulk of our people. The problem is not with our negotiators in Singapore. It rather lies in the conduct of our own domestic economic policy since 1991, which has unthinkingly sacrificed both national sovereignty and the possibilities of more balanced and equitable development at the false altar of a globalisation which at best benefits a small elite at the cost of the masses.

FOOD PRICES

Paying for Mismanagement

THE sharp rise in wheat prices in recent weeks has opened up the whole subject of failure of supply management, particularly with relation to foodgrains, and its consequences for the extent and nature of inflation in the economy. The deceptively moderate annual inflation rate of 6.8 per cent, as measured by the official wholesale price index, has lulled the government into

thinking that it has been able to keep inflation under control. But, as is widely recognised, this is essentially a case of suppressed inflation. The administered prices of foodgrains supplied through the public distribution system, coal, fertilisers and petroleum products as well as electricity tariffs have been due for revision now for almost two years. Further, the markedly small rise in the prices of manufactured products only reflects the industrial economy sliding into a recession. Over the 12 months to November 30, while the general wholesale price index has risen by 6.8 per cent and the index for 'primary articles' by 9.2 per cent, that for 'manufactured products' has gone up by only 3.5 per cent. Even this small rise has been essentially the result of some food items in the 'manufactured products' category showing a sharp increase in prices. Thus the index for the 'food products' subgroup under manufactured products has risen by 6.1 per cent over the past year and within the subgroup, the index for grain mill products has gone up by 29.1 per cent, bakery products by 8.6 per cent and salt by 17.6 per cent. On the other hand, major industrial product groups have seen markedly moderate price increases – chemicals 3.7 per cent, cement 1 per cent, metals 2.7 per cent and machinery and machine tools 4.4 per cent – reflecting subdued demand conditions, though increase in imports may also have played a role.

The rise in the prices of 'food articles', on the other hand, has been phenomenal indeed. Over the past year the price index for 'food articles' has risen by 14.2 per cent and that for 'foodgrains' by 16.2 per cent. Among foodgrains, prices of cereals have risen by 16.2 per cent and those of pulses by 16.7 per cent. Among other food items, prices of vegetables have risen by 32.5 per cent and of fruits by 26.7 per cent. By no stretch of the imagination can this be described as a situation of stable prices or even of low inflation. Ever since the so-called economic reforms were initiated in 1991-92, price increases have been the highest in the case of mass consumption items. Between the end of March 1991 and November 30 this year, when the general wholesale price index rose by 66.2 per cent, the index for 'food articles' went up by 83.6 per cent and that for foodgrains by 87.4 per cent; within foodgrains, the index for pulses rose by 97.2 per cent. Similarly, the index for vegetables rose by 163.4 per cent, that for fruits by 74 per cent and that for the eggs, meat and fish subgroup by 102.5 per cent. Because of these large increases in the prices of basic consumption items, the rise in the consumer price indexes has been sharper than that in the general wholesale price index. While the average monthly index of wholesale prices rose by 65.3 per cent between March 1991 and September this year, the consumer

price index for industrial workers rose by 71.1 per cent and that for agricultural labourers by 77.8 per cent.

The sharp rise in prices of agriculture-based basic consumption goods has occurred precisely during a period when the country has experienced almost nine consecutive years of good agricultural seasons. The explanation for this paradox is to be sought in the government's pricing, public procurement and supply management policies. In the initial years of the economic reforms, the government announced large increases in the procurement and support prices of foodgrains and also in the issue prices of foodgrains supplied through the public distribution system. This resulted in a reduction in the offtake of foodgrains from the system, though more recent increases in procurement prices have not been accompanied by increases in issue prices. Also, as a result of higher procurement prices and the reduced offtake, food stocks with the public procurement agencies shot up, to a peak level of 37.5 mn tonnes in May 1995. But, as the behaviour of food prices shows, the benefit of high agricultural growth and large public stocks of food has not gone to the consumers, thanks to the government's supply management policies.

There are four elements in the government's supply management policies which are a departure from the past and which have contributed to the uptrend in the prices of foodgrains in particular and of food items in general. First, in September 1993 the government adopted the policy of selling rice and wheat from its stocks in the open market with the twin objectives of disposing of a part of its stocks which was deemed to be surplus and checking the rise in the open market prices. The government had claimed, in the new language of the reforms, that it was performing "its market intervention function to moderate supply side effects on inflation". The basic purpose of the public distribution system to enhance food security and ensure stability in food prices was deliberately diluted in favour of enlarging the space available to private grain traders for their operations. Likewise, the goal of generating employment by using the stocks of foodgrains has been virtually forgotten. Simultaneously, as a result of the sharp increases effected in issue prices, there has been a narrowing of the difference between prices under the public distribution system and those prevailing in the market. While improved market supply due to higher output may have played a part in reducing the offtake from the public distribution system, the larger availability in the market was generally at higher prices and so its role is likely to have been small. The government generally allocated 11-12 mn tonnes of rice and 9-10 mn tonnes of wheat annually for distribution

through the public distribution system. In the years from 1990-91 to 1992-93, the actual offtake ranged from 7 to 8.8 mn tonnes of wheat and 7.9 to 10 mn tonnes of rice – generally over 80 per cent of the allocation. In the next three years from 1993-94 to 1995-96, the offtake of wheat came down sharply to below 50 per cent of the allocation and of rice to a little over 60 per cent – that is, about 5 to 6 mn tonnes of wheat and 7 to 8 mn tonnes of rice. On the other hand, the government has sold since September 1993 over 12 mn tonnes of wheat and 2 mn tonnes of rice from its stocks in the open market.

Second, the government permitted export of wheat and rice. As rice export was put under open general licence (OGL) and restrictions on quantities and prices were removed, actual export in 1995-96 (October-September) at 5.51 mn tonnes turned out to be far above the target of 2.5 mn tonnes. In wheat, 2.5 mn tonnes of non-durum wheat and 0.5 mn tonnes of durum wheat were authorised for export in 1995-96 (April-March) and the export period has just been extended to June 1996. Exports and free market sales have contributed to a drastic reduction in the stocks of foodgrains with the public procurement agencies. Total stocks stood at 19.7 mn tonnes at the end of September this year, a good 10 mn tonnes lower than the level (29.95 mn tonnes) a year ago. What is more, while the stock of rice at 9.34 mn tonnes is barely equal to the minimum norm of 9.2 mn tonnes prescribed for the period, the stock of wheat at 10.36 mn tonnes is well below the prescribed norm (13.1 mn tonnes). Even so, there is tremendous pressure on the government to remove the ceiling of 1 mn tonnes on wheat exports in 1996-97 (April-March). The Agricultural and Processed Food Products Export Development Authority (APEDA) has described the present quantitative restrictions on wheat exports as a case of muddled policy, while the Roller Flour Millers' Federation has sought a ban on wheat exports and appealed to the government to encourage export of so-called value added products. That traders are determined to mop up available surpluses and also export wheat on a larger scale is evident from the fact that against the permitted quota of 1 mn tonnes for 1996-97, applications for export of 4.6 mn tonnes are known to have already been made so far. And as a result of the encouragement given to traders, procurement of wheat in the 1996-97 marketing season (April-March) so far at 8.18 mn tonnes has been a third lower than the procurement of 12.32 mn tonnes in the corresponding period of 1995-96. The fall in procurement is much sharper than the reduction of 3.1 mn tonnes in wheat production, from 65.3 mn tonnes in 1994-95 to 62.2 mn tonnes in 1995-96.

Third, the government took a policy decision in September 1994 not to enforce monitoring of stock limits under the Essential Commodities Act which has been seen as a sort of green signal to private traders to increase their speculative hoarding. Some state governments have sought in panic the centre's permission to enforce the stock limits and now at last the union agriculture ministry has ordered an in-house enquiry into the cornering of a large quantity of wheat released by the FCI in the past three months by traders.

Finally, speculative tendencies have been further spurred by the RBI's latest decision to exempt all commodities, other than controlled sugar, from selective credit controls effective from October 21. According to the RBI's perception, this was necessitated by what it called a favourable supply situation. Before the ink was dry on the RBI's policy pronouncement, the government has been forced to take a decision to import 2 mn tonnes of wheat and also allow roller flour mills to import wheat freely to meet their requirements.

The transformation of the wheat supply situation from one of 'excess' stocks to one of shortage and imports despite high levels of output for many years does not augur well for food security in the country. Under the impulse of economic liberalisation, rich peasants and foodgrain traders have enormously enhanced their clout and the government's feeble efforts at so-called market intervention through open market sale of foodgrains from its stocks and through imports are likely to prove inadequate for thwarting their manipulations. Wheat prices are already up by nearly 40 per cent between November 1995 and November this year for the 'deshi' variety and by about 58 per cent for the Hapur market farm variety, which can only be explained by speculative hoarding by traders. The government does not appear to have formulated any worthwhile response to cope with the immediate and longer-term implications of the development. Immediately, the gap between the required minimum norm and actual wheat stocks with the public procurement agencies is sure to widen with its implications for further price rise. With international prices of wheat also rising, plans of importing the grain on a significant scale may not succeed. This situation has serious long-term implications because in many parts of the country wheat has been extensively substituted for coarse cereals whose output has dwindled quite markedly. Total coarse grain output has declined from 36.6 mn tonnes out of a total foodgrains output of 179.5 mn tonnes in 1992-93 to 30 mn tonnes out of a total output of 185 mn tonnes in 1995-96. The country, it appears, has been pushed into another spell of food shortages and high inflation by the government's ideological whims and fancies.

POLITICS

Season of Change

WITH the trooping in of the prodigals, one by one, back into the Congress fold, one hears on the capital's grapevine that Congress president Sitaram Kesri may feel emboldened to repeat the performance of his illustrious predecessor, Indira Gandhi, who at the opportune moment pulled the rug of support from under the feet of the non-Congress minority government of Charan Singh at the centre and bounced back to power.

Meanwhile, within the ruling United Front, rumblings of discontent are threatening to explode into a crisis. The Left partners, who expected the Front to, at the least, set an example by providing a clean leadership, are discovering to their chagrin that their allies like Mulayam Singh Yadav and Laloo Yadav are no less tainted than the Congress politicians. While they are gradually distancing themselves from these disreputable and unscrupulous characters, the latter are also feeling insecure in the United Front, what with the CBI inquiries and other allegations mounting against them. Knowing the mercurial nature of Laloo Yadav, one should not be surprised if he shifts his loyalty to Kesri – given the rapport between the two in the state politics of Bihar – in order to escape prosecution by the Deve Gowda government for the fodder scam. At the moment, he has more to fear from Deve Gowda than Kesri and may not hesitate to put in his little bit to topple the government at the centre, in exchange of protection from a future Congress government.

The configuration of the political stars therefore seems to favour Kesri. Within the party, Narasimha Rao and his followers, humbled by their defeat at the recent Congress parliamentary party executive elections, are in the dumps. The return of the old Congress leaders will increase the party's strength in the Lok Sabha to 142 and may also attract soon the Tamil Maanila Congress of G.K. Moopanar. While the United Front is bumbling along the road of its Common Minimum Programme, the main rival BJP is also in a bad shape, riven with dissensions and disgraced by allegations of corruption. It is against this background that Kesri is trying to revamp the Congress organisation by bringing in new people at the helm (like a young leader to head the Youth Congress) and giving it a 'clean' image, and preparing for the final push.

But Kesri's plans may go awry. For one thing, unlike past occasions when the Congress toppled non-Congress governments, the party is today no longer bound together by the dynastic unipolar Indira-Rajiv leadership. This time, the party is going to face a multipolar contest on the leadership issue. The return of people like N.D. Tiwari,

Arjun Singh, Madhavrao Scindia and others to the party may hoist the morale of the Kesri-led Congress organisation, but is a threat to the personal ambitions of Kesri, Sharad Pawar and other old-timers who had remained with the party and will not have to contest with these veterans for positions of power – the few coveted posts such as those of the prime minister, the Congress president and the leader of the Congress parliamentary party. All they have in common is their opposition to Narasimha Rao. But if they push the anti-Rao stance too far, it may again split the organisation.

Besides, the present prime minister may prove to be a match for Kesri, both being wily politicians having graduated from the common school of skulduggery sans ideology that had emerged in post-independence Indian politics. Deve Gowda can heat Kesri at his own game. Being prime minister, he can still selectively wield the axe of the CBI against his opponents. The cabal surrounding Kesri, notwithstanding the pretension to a 'clean' image, may not be totally immune to allegations of involvement in one scam or the other, given the reputation of Congress politicians.

In this context, the Swiss court's clearance of the Bofors papers (allowing their transfer to Indian investigators inquiring into the allegation of bribes paid by Bofors to Indian politicians for the 1986 gun deal) can be a shot in the arm of Deve Gowda – of course, if he wants to make use of the possible disclosures contained in those papers. The Bofors documents, it is an open secret, implicate Ottavio Quattrocchi, a close friend of the Gandhi family at Delhi's 10 Janpath. If further disclosures confirm the family's involvement, as suggested by circumstantial evidence, it may reduce the clout that Sonia Gandhi continues to enjoy in Congress politics from behind the scenes and the lung-power of her camp-followers inside the party.

HEALTH CARE

Irrelevant Labels

LAST week a corporate hospital proudly announced that it had received ISO certification, the first for any hospital in India and among the first in Asia. The certification means that the hospital is able to deliver a uniform standard of service; it is a certificate of quality assurance. Presumably such certification is awarded on the basis of a code or set of minimum requirements evolved for the medicare industry. The certification therefore provides a guarantee of delivering a uniform quality of the services it professes to deliver to all those who buy those services. In other words, if consumers are shopping around for a service/product then the certification helps them to make a choice. But this is possible

only if there are competing establishments offering/selling the same service/product; two, if there is no severe time constraint; and, three, if the consumers has sufficient resources to ensure that their is not restricted.

Clearly none of this obtains for the vast majority of Indian consumers of health care. It is well documented that hospitals and medicare institutions are a sort of last resort, not just to the poor but even the urban middle class. Financial resources are a severe constraint. And given this, the choice of establishments is extremely limited. Sections of the population which have any chance at all of raising the required resources opt for private hospitals, usually the closest, or those where a doctor or a nurse is known to the consumer or which are otherwise recommended. Those who are too poor to do this go to the public hospitals. But then corporate or large 'charity' hospitals are not meant for these sections of the population. However, such an accreditation is useful for attracting consumers in an international market – from west Asia, some African countries, even east Asia and, it is hoped, the former Soviet countries. And clearly the expanding corporate health sector in India cannot survive without accessing this market.

There is also the issue of the basis on which an ISO accreditation is granted to a hospital/medical institution. Is it on the basis of efficiency and sophistication and the high technology of the equipment used? Is it the qualification of the medical staff? Is it the patient luxuries offered in the wards? Is it

the number of complicated cases they have handled? Or is it the 'cure-rate' if one might call it that, of the patients, the number of ill people it has made well? Is it the bed occupancy ratio? Is it the patient comfort services? Is it the patient information services offered, the record keeping, the degree of patient friendliness?

It is not that standards certification is irrelevant. In fact over the years some professional groups have attempted to evolve an accreditation system for hospitals. Such systems exist in many western countries and in each it is professional groups which have evolved and implemented them initially. Closely associated with them have also been private insurance institutions. In India, the medical profession has not arrived at a point where intra-professional competition has been blunted to the extent of realising the advantages of self-regulation. This is unfortunately a feature of the colonial bind in which the medical profession in the subcontinent is trapped. A different move towards instituting an accreditation system for hospitals has been suggested by people's health groups where the central focus is patient comfort. It has also been argued that with consumer courts becoming functional and medical cases being allowed under the COPRA, some sort of standardisation of services is imperative. This can happen if the profession can actively reassert its identity and its chief concern, the patient and the provision of health care, and it can work with people's movements in health.

NATIONAL ACCOUNTS STATISTICS OF INDIA 1950-51 to 1994-95

A comprehensive set of time series on almost all aspects of national income statistics of India for 45 years from 1950-51 to 1994-95. Each set of the CSO's data presented with a description of concepts and compilation methods and also with brief critical comments on them.

CURRENT STATISTICS

EPW RESEARCH FOUNDATION

In the OECD countries, apart from significant increases in unemployment rates since the mid-1980s, there have occurred noticeable changes in the profiles of employment and unemployment. Part-time employment has risen both among men and women. While women still account for a preponderant part (generally over 70 per cent) of part-time employment, the share of men has been rising. In self-employment (both sexes), the levels and trends differ among countries. Long-term unemployment rates also show wide differences (ranging from 12 to 59 per cent). Unemployment rates for women are generally lower than for men and this holds for youth unemployment rates as well.

BHARAT FORGE

New Projects

WITH the resurgence in demand for medium and heavy commercial vehicles, Bharat Forge, the flagship of the Kalyani group, has performed well during 1995-96 with its net profit almost doubling from the previous year's level. The company is the largest forging company in Asia and a majority of its products cater to the automobile industry.

The company's net sales increased by 42.1 per cent over the previous year, while value of production increased by 37.7 per cent over the same period. With a lower rise in operating expenses, following cost reduction and a continuous quality improvement programme, the company managed to boost its operating profit by 50.8 per cent over the previous year. During the last three years, the company has approached the capital market twice. This has helped it to reduce its dependence on term loans thus effectively limiting the increase in interest burden. Interest charges rose by a lower 28.8 per cent during the year and a mere 6.3 per cent rise in depreciation coupled with a zero income tax provision (1994-95: nil), helped the company to post a smart rise in net profit during the year under review. Exports too increased significantly by 80 per cent to Rs 48.9 crore. Although imports increased sharply by 152.5 per cent over the previous year, the company continued to be a net foreign exchange earner. With the sharp rise in net profit, earnings per share improved from Rs 8.8 per share last year to Rs 12.6 per share while the company's book value rose from Rs 81.6 per share to Rs 101.5 per share.

During the year under review, the company's financial services division reaped the rewards of a tight liquidity situation as a result of the cash rich position of the company. The company also transferred its wheel rim division on 'a going-concern' basis to Kalyani Lemmerz, a joint venture with Lemmerz Holding GmbH, Germany.

The company is setting up a plant for the manufacture of finish machined crankshafts in Pune. The project, which is estimated to cost Rs 76 crore, is expected to commence commercial production during the second quarter of 1997. By the turn of the century, the company plans to more than double its installed capacity to 1.5 lakh tonnes per annum and achieve a revenue target of around Rs 1,000 crore. The company has diversified into connecting rods and has entered into a tie-up with its technical collaborator, Federal Forge of US, for a 50 per cent buy-back arrangement for three lakh pieces. The project is expected to be a major revenue earner for the company in the years to come.

The company has also entered into technical know-how and assistance agreements with Metalart Corporation, Japan and Nissho Iwai Corporation, Japan for the manufacture of small precision forgings. With a view to de-emphasising the presence of consumer electronics in the company's investment portfolio, Bharat Forge has reached an understanding with Sharp Corporation under which the latter increased its stake in Kalyani Sharp to 51 per cent, thus reducing Bharat Forge's holding from 40 per cent to 29 per cent.

During the year, the company allotted 15,68,600 equity shares of Rs 10 each at a premium of Rs 186.93 per share to its senior executives; 29,26,450 equity shares of Rs 10 each at a premium of Rs 40 per share on conversion of coupon warrants attached to 'Tenth Series' debentures, and 18,00,000 equity shares of Rs 10 each at a premium of Rs 107.18 per share to the promoter group. With this, its total equity share capital rose from Rs 27.9 crore last year to Rs 125.9 crore on March 31, 1996. Further, it also issued redeemable non-convertible cumulative preference shares of Rs 10 each at par on private placement basis.

The company's share price currently rules around Rs 77.75 on the basis of discounting its 1995-96 earnings per share 6.2 times.

KIRLOSKAR OIL ENGINES

Strong Brand Equity

Kirloskar Oil Engines, a Kirloskar group company, is engaged in the manufacture of engines between 3 HP and 650 HP, 'R' type engines, bimetal bearings, engine valves, bimetal strips, diesel engines above 250 HP (in cylinders), assembly of generating sets in the range of 0.5 kVA to 10,000 kVA, camshafts, steam turbine generating sets up to 60 MW and machinery for forming laundry moulds of sands.

In 1995-96 the company has performed well with net sales and value of production rising by 50.5 per cent and 51.8 per cent, respectively, over the previous year. Although manufacturing expenses increased by 51.1 per cent, a lower rise in other operating expenses helped the company post a 74.5 per cent rise in operating profit. Despite a steep rise in interest charges (up 80.3 per cent), a 40.4 per cent rise in depreciation charge and a tax provision of Rs 1.8 crore (1994-95: nil), the company managed to post a 69.9 per cent rise in net profit.

In the small engines segment, the market for portable pumpsets registered a growth of 12 per cent while sales in the agro-industrial market saw an increase of 13 per cent over the previous year. The company produced

74,043 engines between 3 HP and 650 HP and 21,994 'R' type engines compared to 61,778 and 17,816 produced in the previous year, registering rises of 19.9 per cent and 23.5 per cent, respectively. Production of bimetal bearings and engine valves also increased from 14,233 million to 17,981 million (up 26.3 per cent) while that of bimetal strips increased by 15.4 per cent from 2,213 tonnes last year to 2,554 tonnes. The company also produced 70 diesel engines above 250 HP (in cylinders) compared to 41 engines in the previous year, netting an increase of over 70 per cent.

The company's auto division continued to perform well and the in-house manufacture of automatic link machining lines is expected to improve productivity and quality of bearings in addition to reducing manufacturing costs. With the valve manufacturing capacity being shifted from Pune to Nasik, the production of valves doubled during the year under review and there was a reduction in manufacturing costs. While the auto components division continued to show a robust growth, the company continued its efforts to enhance the 'Kirloskar' brand equity through quality service to OEMs and strong field-work. The company's engine division increased its market share from 20 per cent to 30 per cent in the large engine segment due to the favourable climate for new industries and the augmentation of manufacturing facilities. Kirloskar Oil Engines already has an 80-85 per cent market share in the small engines segment.

The company's share price, meanwhile, is hovering around Rs 60 discounting its 1995-96 earnings per share by 5.1 times.

DCM DAEWOO MOTORS

Accelerated Progress

After launching its 'Cielo' range of cars in July 1995, DCM Daewoo Motors seems to have surged forward in terms of sales and profits. The response to its cars was encouraging and the company also came out with an upgraded version of the 'Cielo' - Cielo GLX, a luxury model, in September. The luxury model offers many new features such as tiltable steering, CD music player system, moulded trim doors, rear seat belts, power window controls for each passenger as standard fittings and air safety bags as an optional feature.

For 1995-96, the company saw a net sale of Rs 459.5 crore and a net profit of Rs 49.7 crore compared to net sales of Rs 125.8 crore and a net loss of Rs 9 crore in the previous year, 1994-95. The company produced 9,117 cars and 2,071 light commercial vehicles

- means not available

(LCVs) and sold 9,044 cars and 1,975 LCVs during the year under review. Its thrust on exports also saw its exports of LCVs increase from 787 vehicles last year to 987 vehicles, representing an increase of 25 per cent. The company has completely wiped off its accumulated losses and seems set to capture a significant part of the car market in the country.

Meanwhile, for the first half of the current year the company has earned a net profit of Rs 28.2 crore on gross sales of Rs 584.3 crore compared to a net profit of Rs 17.5 crore on gross sales of Rs 114.5 crore in the corresponding period last year. The company plans to drop the word 'DCM' from its name after its rights issue in December as the DCM group will be renouncing its 24 per cent holding in favour of Daewoo Corporation of South Korea. After this, Daewoo Corporation will have a 75 per cent stake in the company and there will be a complete change in the board of directors. After formally acquiring Toyota's 2.5 per cent, the Korean car-maker's stake will further increase to 77.5 per cent.

The rights issue, which is expected to garner around Rs 700 crore, is being made to finance the doubling of the production capacity from the existing 72,000 cars per annum to about 1.5 lakh cars per annum. While 70,000-75,000 vehicles will be its small car, the rest of the capacity will be used for the launch of larger luxury models. By the year 2002, the company plans to achieve a targeted total capacity of up to 2,10,000 cars.

Due to the slowing down of the car market, the company has revised its earlier sales target sales for 1996-97 from 50,000 cars to 36,000 cars. However, as it managed to sell only 12,000 cars in the first half of the year, the revised target also seems difficult to achieve. The company claims that it has already achieved 45 per cent localisation as far as the 'Cielo' cars are concerned and by April 1997 localisation is expected to shoot up to 75 per cent following the commissioning of its project to manufacture engine, gear box and panels locally.

With the company's Korean competitor, Hyundai, planning to launch its small car in 1998, DCM Daewoo has advanced the launch of its own small car, christened 'Tico', by about two years to early-1997. In the luxury car segment too, the company plans to introduce the 'Daewoo Espero', a 2000 cc luxury sedan estimated to be priced around Rs 10 lakh, in March next year. In order to compete with Telco and Bajaj Tempo, the company plans to launch its 3.5 tonne LCV early next year. This will be followed by more vehicles in this range.

The company's share price currently rules around Rs 17 discounting its 1995-96 earnings per share 3.1 times.

The Press Council's Bill on Right to Information

A G Noorani

The Right to Information Bill drafted by the Press Council is a step in the right direction and merits close study by the media and wide public discussion.

THE Press Council of India has prepared a draft Right to Information Bill, 1996. It is preceded by a brief explanatory note. The Bill is a step in the right direction and the Press Council and its chairman, Justice P B Sawant deserve praise for this. The Bill merits close study by the media and wide public discussion.

The note makes no reference to the Supreme Court's recognition in several cases that the right to know, the right to information, flows from the fundamental right to freedom of speech and expression, embodied in Article 19(1)(a) of the Constitution. The major cases are - the State of UP vs Raj Narain AIR 1975 SC 865, Maneka Gandhi vs Union of India AIR 1978 SC 597; S P Gupta vs Union of India (High Court Judges' transfer case) AIR 1981 SC 149; and Secretary, Ministry of I and B vs Cricket Association of Bengal and Ors. (1995) 2 SCC 161.

The proposed law will not confer any new right on the citizen. It will only provide a procedure for the enforcement of an existing fundamental right which the legislature has no right to curtail; still less the executive.

As it is, Section 75 of the Indian Evidence Act, 1872 binds "every public officer having the custody of a public document" to give any person "a copy of it on payment of the legal fees" for it. It is subject to one qualification which defines the status of that person, precisely his *locus standi*, in these words: "which any person has a right to inspect". The ambit of the Indian citizen of an Independent Democratic Republic in 1996 is surely far greater than that of an Indian subject of the British crown in 1872. His right to petition for public causes through writ petitions has received a wider interpretation in the Supreme Court only in the last decade and a half. A similar interpretation needs to be given to his 'right' to inspect under Section 75 of the Evidence Act.

The Bill must remove all doubts on this right. Even so it will not be enough unless the state's power to withhold information is restricted to accord with the citizen's right to know. In short, the Official Secrets Act, 1923 must be reformed. As it stands it is

clearly violative of Article 19(1)(a) and is void. On this the Press Council, headed by Justice R S Sarkaria - no liberal, he - did something egregiously wrong. The Council, headed then by Justice A N Grover, had prepared a draft Bill to reform the Official Secrets Act in 1982. In 1990 the Council backtracked on its own draft and proposed one which was more restrictive. It imitated Margaret Thatcher's Act of 1989, a glaring instance of blind imitation of the British.

To come to the PCI's Bill of 1996, its core is Clause 3 which reads thus:

- "(i) Every citizen shall have a right to information from the public body;
(ii) It shall be the duty of the public body to maintain all records duly catalogued and indexed,
(iii) The public body shall be under a duty to make available to the person requisitioning information, the information sought for including such information as it is under an obligation to obtain and furnish and shall not withhold any information or limit its availability to the public except the information specified in Section 4;
(iv) All individuals whether citizens or not shall have right to such information as affects their life and liberty."

Is not this sub-clause (iv) restrictive of sub-clause (i)?

This provision must be read along with the definitions in Clause 2. 'Information' means any fact relating to the affairs of a 'public body' and includes the records relating to its affairs. The right to information means the right to be informed of its affairs and includes inspection of the records as well as taking notes and receiving certified copies. Clearly the crucial definition is that of the 'public body'. It is defined thus: " 'Public body' includes: (a) State within the meaning of Article 12 of the Constitution of India; (b) All public undertakings and non-statutory authorities; and (c) A company, corporation, society, trust, firm or a co-operative society, whether owned or controlled by the government or by private individuals and

institutions whose activities affect the public interest."

Thus a company like Union Carbide would come within its sway. But the doubt persists. Is the right to information contingent on proof that the information affects the citizen's 'life and liberty'? This is either superfluous or, worse, unconstitutionally restrictive. It violates Article 19(1)(a). A citizen has, for instance, a right to know of matters of foreign policy; indeed any matter of public policy quite regardless of his personal interest. That is what citizenship is about - an informed interest in public affairs, not involvement exclusively in personal well-being.

This right is subject only to 'reasonable restrictions' and only on grounds mentioned in Clause (2) to Article 19(1)(a) such as the security of the state. Clause 4(1) of the Bill reproduces most of them and adds to them "investigation of an offence". Sub-clauses (2) and (3) mention personal or medical information of a private nature and trade and commercial secrets protected by the law.

Clause 5 is a salutary provision which enjoins public bodies to offer information to the general public. It has an interesting clause which reads thus: "It shall be mandatory for each custodial establishment such as a police lock-up, jail, mental asylum, remand houses, beggars home, etc., to appoint a visitors' committee comprising independent citizens which shall have full access to the custodial establishment at all hours of the day and night and to the records and inmates of such establishment."

The rest of the Bill lays down the procedure for the enforcement of the right. If information is refused improperly the officer will be held responsible personally. Information must be furnished within 30 days of the application. Reasons must be given for any refusal. Appeal against refusal lies to the principal civil judge of the area.

One is reminded of the Karnataka Freedom of Press Bill, 1988 (L.A. Bill No 12 of 1988) Clause 3(1) of the Bill said: "Every person who is bona fide requires a public document shall be entitled to obtain access to such document other than the ones specified in Clause (2)." It, incidentally, also provided journalists immunity against disclosure of source of information. The Press Council would do well to take up that subject in earnest before long.

LNG Policy for Power

More Questions than Answers

Kannan Srinivasan

The current intense interest in and lobbying for basing a part of the power programme in India on liquefied natural gas (LNG) has to be seen in the context of the global slow-down in demand for LNG. The overcapacities among most large producers of LNG has prompted a desperate search for new consumers, and India appears to be succumbing to that international pressure without scrutinising the feasibility of opting for an LNG-based power programme.

THERE has been strong lobbying for India to base part of its power programme on imported LNG — at every available forum.^{1,2,3}

And things are moving fast on the ground. Enron has signed a letter of intent for a partnership with GAIL, and hopes to reach an agreement for the supply of 5.8 million tonnes of LNG annually to Gujarat as well as its own 1624 MW power plant at Dabhol. The ministry of petroleum and natural gas has given extraordinary permission for retired GAIL chairman K. K. Kapoor to immediately join Enron as a consultant. Yet government rules require that there be a 'cooling-off' period of two years before a PSU official or civil servant takes up private service, in order to minimise the osmosis of confidential government information and any conflict of interest. The petroleum ministry has directed that a new undertaking be formed — the LNG Corporation of India — to set up facilities to import liquefied gas. GAIL, IOC and other PSUs will have to invest 60 per cent; the remainder may come from an international oil major. Enron has held talks with QGPC and Ras Laffan LNG company (70 per cent QGPC, 30 per cent Mohil) on purchasing the gas from Ras Laffan's second 2.5 million tonnes/year train and dedicating it to Enron's Dabhol plant with deliveries starting in 1999.

Yet the costs of an LNG policy for power in India have not been seriously examined. Is this the appropriate choice of fuel? Although GAIL has done some costing, this has not been made publicly available before recommending these massive investments. How does LNG compare as a fuel for power with coal, crude or fuel oil? We have been provided rule-of-thumb figures, without any explanation as to how they are derived. The other virtue of LNG is that it produced almost negligible emissions compared to most industrial fuels. Now, many environmental benefits can be expressed in economic terms:

but the petroleum ministry's economists resist that temptation. Much of this hard-sell has the flavour of the unspecific discussion about nuclear power 25 years ago. The costs of disposal of nuclear wastes were dealt with only when they had to be identified and segregated. Then it became clear that the supposed low cost of nuclear power did not take into account the disposal of nuclear waste and closing down plants, which must ultimately be absorbed by the government. Similarly, in discussion today about LNG, we are only told that world gas reserves are larger than those for oil. But the enormous cost of the transportation of such fuel — in comparison to the transportation of oil — are not seriously discussed. Petroleum secretary Vijay Kelkar sees a global elegance in uniting a clean fuel located in one remote part of the world with the demand somewhere else — without going into the enormous costs of liquefaction, shipping in special gas carriers, regassification and transportation and storage at the receiving point before this gas is used in power plants. And all these investments must be secured in advance.⁴

The costing of one of the Seven Sisters — with large gas holdings and LNG investments — is \$ 6.7 billion for a 6 million tonne per annum for a two train project. Liquefaction costs amount to 40 per cent of the total investment (\$ 2.8 billion), exploration and production costs 25 per cent (\$ 1.7 billion), shipping investments 30 per cent of the total (\$ 2 billion) and terminal costs 5 to 10 per cent (\$ 0.5 billion). This capital cost of about \$ 1000 per tonne will work out to a capital charge of around \$ 250 per tonne. That should be compared to around \$ 120 for the import of low-sulphur heavy stock fuel oil. This would include the cost of raising resources for investments assuring a 20 per cent pre-tax and a 9 per cent post-tax. The cost of funds would be around \$ 200 per tonne and the cost of gas another \$ 50, liquefied. This works out to a capital

investment of \$ 1000/a tonne of LNG produced annually, not even including depreciation, maintenance and royalties. So the cost of LNG plus the necessary capital investment will have to be compared with other choices of fuel such as naphtha and fuel oil — which may be around 40 per cent to 60 per cent of LNG price (not counting LNG capital investment in terminal facilities). LNG carriers cost around \$ 250 million per ship and an LNG fleet will require an annual expenditure of around \$ 100 million for repair. From 1975 to 1979, there was a boom in LNG fleets. Today we are replacing the fleets built between 1965 and 1974, which are being scrapped. So although there is a surplus LNG capacity, there is no surplus fleet: these fresh investments will be reflected in the delivered price of gas. This is the investment till the point of receipt in India. An entire new set of investments must thereafter be made. An important element is the setting up of terminal facilities. Because of high safety requirements, an LNG terminal cannot be integrated with any existing port. An international engineering contractor estimates that another \$ 2 billion will have to be invested in terminal, storage and regassification facilities for this LNG when it reaches India.

There is no world market for gas. Such a wide range of prices prevail, depending not only on transport costs — but also the bargaining strength of the importer. Today with overcapacities having been created, a strong importer could conceivably obtain an attractive price. But even that has to be within a range. An eminent international energy expert estimates that the range of prices that could prevail should vary between around \$ 2.5 million British Thermal Units (MBTU) and \$ 3.5/MBTU. The US has paid prices of around \$ 1.5/MBTU for LNG because it has large reserves, and can import from Canada or from Mexico. Europe pays around \$ 2.5/MBTU for LNG. It has the alternative option of importing gas through the Algeria-TransMed pipeline; and of importing from Russia. Rates of around 3.5 have prevailed in Asia. Economies such as Japan, Korea and Taiwan which have no domestic fuel and must in any case import, have determined this price. BP's *Review of World Gas*, 1995 shows that Japan's average CIF price actually went down from \$ 3.35 to \$ 3.04 for imports from Alaska, from \$ 3.52 to \$ 3.07 for imports from Abu Dhabi, from \$ 3.46 to \$ 3.05 for import from Malaysia per MMBTU. The lessons for India are that LNG prices even in 1994 were around \$ 3.0, and sliding further south: \$ 2.5 may be more realistic than \$ 3.5. Second, Japan and Korea's LNG requirements were unique and do not

apply to India. Their downstream industry had already been built on the basis of LNG imports; LNG terminal facilities already existed; these countries were strong in ship building and commercial shipping; they are a considerable distance from assured source of gas supplies. What should be the price of this imported LNG? The indicative price has been taken to be that arbitrarily arrived at for the gas to be delivered by the Oman-India Pipeline. Whether this is the right price to pay for fuel in India and the best price to pay for west Asia liquefied gas – of that there is no discussion. An eminent international energy specialist argues that the break-even price for new LNG projects in west Asia is a little below \$ 2.4/MBTU. There is a virtual conspiracy to compel us to accept \$ 3.5/MBTU as the price for LNG – a price paid by Japan, a country much further off from producers than India, on older contracts, and hence with much greater shipping costs – and at a time when its demand was high. India should aim for \$ 2.4-2.5/MBTU as the price to be negotiated – if indeed it should import LNG at all.

Global trade has largely been the imports of the Japanese and the prosperous Asian Tigers, as well as west European imports from Australia and elsewhere. The appetite for west Asia gas producers who sit on reserves so large that they often have not even been explored – because they have functioned primarily as producers and exporters of crude oil – has been whetted. They have now kicked in with vast projects promoted by global oil and gas majors such as Mobil, Shell and Enron. These overcapacities seem to be the reason for their hard sell in India.

Projects may have been proposed on the basis of inflated demand forecasts and may therefore not materialise in the time-frame that the suppliers expected. And that demand to accommodate those supplies may well not be established until after 2010. We should keep an eye on investors in LNG plants – namely, Shell, Mobil, Total, Marubeni, Mitsui, QGPC of Qatar, Hunt, Exxon, Mitsubishi, Enron and Itochu – as those which may have a strong vested interest in promoting LNG consumption in India and elsewhere in Asia Pacific.

The first Indian LNG conference was held in Madras on October 20, sponsored by the Indian PSUs on command from the ministry of petroleum. It was dominated by investors in LNG plans trying to sell their overcapacities; QGPC of Qatar represented by Naseer K Jaidah, Jeffrey Nelson, vice president of Mobil LNG, Herbert Ganmons of Amoco, and representatives also of Marubeni, Mitsubishi and Mitsui Liquefied Gas Carriers. Petroleum minister A Baalu announced that LNG was the appropriate fuel for India and its use should be ensured.

DEMAND SLOW-DOWN

The unexpected slow-down of Japanese demand has created some of the overcapacities of today: since in Qatar, Australia, Oman and elsewhere, oil and gas companies made plans assuming sustained Japanese growth. Japan is a large burner of crude oil and uses LNG for power only at the margin for generating power in urban centres such as Tokyo and Nagoya. The demand for stabilising CO₂ emissions on OECD economies seems to have weakened. Crude burning for power generation will remain a permanent feature of Japan's power scene. LNG power plants are used for peaking load operators to cover the daily fluctuations in power demand; but do not constitute the principal strategy for power generation by Japan. Korea may be revising its demand projections for LNG – namely, 15.5 million tonnes by 2001 – downwards. Quite apart from Korea's dealings with Ras Laffan, its memorandum of understanding with Oman for 3 million tonnes a year beginning in 2000 for 25 years may not be honoured – because it is seeking to reduce its supply volume from Oman – arguing for the diversification of its supply sources. Korea has been playing hard to get with most sellers for some time now: since it has been able to play at least seven suppliers – namely, Qatar, Indonesia, Malaysia, Australia, Oman, Yemen and Russia – off against one another. In 1995, Korea apparently covered all incremental demand above contract levels with spot volumes of LNG from Malaysia, Australia and Brunei at US\$ 2.6 to US\$ 3.1 per MBTU. Taiwan has yet to formalise its contract with Qatar's Ras Laffan project – even though it has signed an MOU for 2 to 2.5 million tonnes of LNG. Even in Taiwan, LNG expansion plans will face fierce competition from light sulphur fuel oil.

Enron – and Indian's petroleum and power ministries – could save Ras Laffan LNG, which has had a tough time firming up customers. Despite many letters of intent from buyers in Asia and Europe, only one firm sales and purchase agreement has been signed: 2.5 million tonnes LNG annually to the Korea Gas Corporation for 25 years. Should Ras Laffan not manage to sell its second train, the entire 10 million tonne/year project may not be economically viable. Korea may not exercise its option to lift the output of one second train and therefore increase its liftings to about 5 million tonnes a year. Only such an agreement would enable Rasgas to start work on 2 trains and award the construction contracts. Rasgas must secure additional LNG customers in the next few months before March 1997 in order to go ahead with the second train. Rasgas has letters of intent from Taiwan's CPC, the Petroleum Authority of Thailand, China,

India's Essar Group and Turkey's Botas, but without any concrete agreement for sale. Botas of Turkey's stated intention and MOU/LOI to buy 2 million tonnes from Rasgas may collapse if it buys 4 million cubic metres from Algeria and 1.2 billion metres from Nigeria.

Shell Gas of the Netherlands and Royal Dutch Shell have a strong stake in promoting the expansion of liquefied natural gas consumption. It is a large investor in giant LNG projects in every country – Oman, Australia and Malaysia among others. Shell runs the risk of having created overcapacities and in any case will face competition from other LNG producers. So it must find new consumers – such as India. The MLNG-III (Malaysia LNG Tiga) project, which will consist of two 3.4 mmt/year trains, will bring Malaysia's export capacity to nearly 23 mmt/year by the beginning of the next century. Partners in the downstream side of the project are Petronas with 60 per cent of the shares, followed by America's Occidental, Japan's Nippon Oil, Shell Gas B V of the Netherlands, and the state government of Sarawak, with 10 per cent stakes each. This will give Shell the unique status of being the only firm involved in all three LNG projects in Malaysia. It is unclear whether the huge expansion projects by Shell in Australia can go ahead as planned. Shell plans to add 23 million tonnes which will therefore pre-empt other demand, drastically reducing or at least delaying the need for grass roots projects. Woodside Petroleum, operator of the North-west Shelf LNG project, has been supporting the development of the new reserves (Perseus) adjoining the North-west Shelf acreage, which are said to contain sufficient gas to support a two-train expansion at a cost of around US\$ 4.5 billion, doubling capacity by the beginning of the next decade. But this would compete with the utilisation of Gorgon gas – developed by a consortium of Shell, Chevron, Texaco and Ampolex called West Australian Petroleum (Wapet). Shell has a very important position in the Oman Liquefied Natural Gas Company (OLNG), where it holds 34 per cent to the Oman government's 51 per cent. France's Total owns 6 per cent, Partex of Portugal 2 per cent, Japan's Mitsubishi and Mitsui and Itochu small proportions. OLNG holds a letter of intent from South Korea for 3 mmt/y, which Korea may find too large after signing with Rasgas for 2.4 mmt/year. Oman has been holding talks with other prospective buyers, but no firm commitments have been made by any to the project. Shell is considering cutting down to only one 3-mmt train, which would affect the economics of the project. The Oman LNG project, with a capacity of 6 MMTPA, will have an excess of about 2 MMTPA between year 2000 and 2003. Every country save India realises this

is not a sellers' market but a buyers' one.

Moreover, the basic question as to how LNG fits into India's power programme has not been seriously examined. What passes for national policy today really amounts to the formulation of unrealistic objectives, and emergency measures undertaken in order to fulfil them which lead to further chaos. In the pursuit of transparency in the stock market, foreign investors and brokers were brought in and the domestic market closed down. Power is important for growth: Enron was invited in to set up projects even if they should bankrupt the state electricity board.

LNG is a clean and efficient feedstock; so it has to be obtained at any cost. The demand for baseload power in India – as distinct from peaking – was first deliberately inflated. Consequent on that inflated figure of demand, it has then been found impossible to meet the target – unless substantial quantities of LNG are imported.

Notes

- 1 The Report of the R-Group says: "... It would appear from above, that in case of south India, LNG imports would be competitive *vis-a-vis* the gas supplies imported through the pipeline at the prices settled with the Oman Oil Company. ..." But we should consider whether that was ever a realistic price. John Deuss and Satish Sharma arrived at some private deal. Why is it now the benchmark? "... LNG has a further advantage over the gas imported through the pipeline in that the investment related to consumption and transportation can be made in phases and do not have to be made in a short span of time. The technology of production of LNG, its transportation and setting up of LNG terminals is a proven one. ..." But there are proven technologies which may be inappropriate to India because they are too expensive, and this coal-rich country has other energy options. "... The new LNG capacities which are being planned in the Middle East – Qatar and Oman, would give enough flexibility to take care of changes in quality required as well as prices, in the future...". The mere fact of west Asia overcapacities does not mean that these prices will be low enough to meet India's requirements; and the great costs of investments to receive LNG are not taken into account.
- 2 Petroleum secretary Vijay Kelkar addresses himself – as in the Lovraj Kumar Memorial Lecture – lobbying for LNG producers. He says "natural gas, unlike oil, can be an harbinger of peace, certainly in our part of the world. While oil has been an instrument of domination and a source of conflict, natural gas will promote co-operation amongst nations. Simple reason for this is that in natural gas trade the relationship between buyer and the seller tends to be more symmetric and contracts are long term. These factors encourage and nurture co-operation." But the sellers are the same multinationals which produce oil firms such as Mobil and Shell. Whatever is asymmetric about oil markets will also be true about gas. "Carbon taxes will play even a greater role in energy policies not only in OECD countries but also in other countries and this will demand energy efficient

technologies even at a higher price. This means places hydrocarbons at an advantage compared to coal and other fuels. This of course will tilt the scales even further in favour of natural gas in the global energy scene." But optimalities are specific to situations and projects. Here we are dealing with commercial contracts with LNG producers. What makes sense for a power plant located in a city centre may not be true of a remote location in a country with large coal reserves. Global optimalities will apply when we plan for the planet as a whole. India, with a population of nearly a billion, produces a very small part of global carbon emissions – at one estimate, less than 0.5 per cent. Moreover, the US is the world's largest consumer of coal.

"What I have in my mind are the offshore sub-sea pipeline routes and the most secured route is of course deep water pipeline route as envisaged in the India Oman Pipeline. There are underlying technological problems in implementing such deep water pipelines but these seem to be such that these may not be insurmountable. Hence, for a century long perspective I have no doubt in my mind that mastering of deep sea pipeline technology will have to be one of our major technology missions. This will enable us to solve, in substantial manner, the great supply question for the next century. What one is suggesting is that to have a super energy highway of deep-water India-Oman pipeline with Oman as a hub and to get natural gas whether from Oman, Qatar, Iran or Saudi Arabia to be imported to India. Such a scheme can be of course supplemented by importing natural gas via on-land route through Pakistan either from Turkmenistan or from Iran." Now this India Oman pipeline has been abandoned by the Oman government as impractical. It would lie over the Owen-Murray Fault, prone to seismic tremors. No pipeline has ever been built at such depth and enormous water pressure. Top international engineering firms refused to even consider this project.

Could it be that the whole exercise of the Oman-India pipeline has been a wilful diversion – in order to simply create a benchmark for imported LNG prices? "Coal, transportation costs would make the price of coal at consumption points in other parts of the country much higher than current levels favouring, particularly greater use of natural gas (whether indigenously produced or imported)." We must consider whether policy is better directed at improving the utilisation efficiency of coal, or such a cumbersome dependence on imports. "The distribution of natural gas reserves in the world is very different from that of crude oil reserves." A large part of west Asia's reserves has not even been explored because the demand has not developed. Now that Oman, Qatar and Yemen are becoming significant exporters, we may soon see the exploration of these reserves. "The investment costs are currently (1996) about \$ 0.7 million to \$ 0.9 million/MW compared to over \$ 1.1 million/MW for coal-based power plants." But should we take Enron's sunis, gas-based combined cycle power plants are more expensive than anything else in the world. "The cost of production of power, assuming that gas is available at about \$ 3.5 per MMBTU, works out to 6 to 7 cents per kWh." The Report goes on to say: "for coal, it would be higher." But this is nowhere substantiated.

For several years always been pushing LNG: a decade ago he argued for it with the same vague generalisations as today. At the time he headed the Bureau of Industrial Costs and Prices (BICP). He wrote 'Towards a new energy policy' in October 1988: "... since the first oil crisis, the basic tenet of India's energy policy has been to treat coal as a primary source of energy; this policy needs a review... It is suggested that the coal sector has emerged to be the 'weakest link' in the vertically integrated national economy. Hence, if the present energy policy is continued, these problems are likely to be accentuated. If one takes into account the import replacement effects through the better performance of energy sector, there is little doubt that the new energy policy would only further improve the net balance of payments position. In any case, our proposed new energy policy envisages much larger use of natural gas. Experience shows that the management of hydrocarbons supplies is much easier than that of coal and the inter-related transport sector."

- 3 Wood Mackenzie Consultants is a subsidiary of NatWest markets. It has energetically lent its voice to the present lobbying for India to import LNG. "Recoverable gas reserves can only sustain a rate of production of 25 to 30 bcm per year for about 27 years. This means that the long-term future of the Indian gas industry must rest with imports." Yet very promising areas in Assam, Tripura and neighbouring Bangladesh and Myanmar are largely unexplored and undeveloped. "This leaves LNG as the only option for the supply of imported gas to India in the short term." At what price will LNG be available in comparison to coal or other hydrocarbon fuels? That central question is nowhere addressed. "Wood Mackenzie forecasts that LNG will be the only source of gas imports into India upto 2010." The scope for the satisfaction of Indian demand with gas from the north-east and our neighbours should really be examined before turning to more elaborate and expensive arrangements elsewhere. "At present, the Indian gas price is fixed by the Government at a level of about \$ 1.50 per MMBTU, this being at a discount to the price of substitutable liquid levels. As we have seen, future incremental supplies of gas are likely to be in the form of LNG and as the weighing of LNG in the gas supply increases, the price of gas to the final customer will increasingly reflect the LNG price. We estimate that typical costs of regasified Qatari LNG to India will be between \$ 3.5/MMBTU and \$ 4/MMBTU at today's prices." Clearly all Indian energy prices will be distorted in order to ensure the success of new LNG projects.
- 4 LNG contracts ensure that investments and guarantees are tightly committed because of the possibility of default. The best-known case of a country having reneged on an LNG import is the US. El Paso Natural Gas Company, Consolidated Energy, American Natural Resources, Trunkline LNG and Sonatrach were major importers and users of LNG from Algeria. Yet natural gas prices fell sharply in America and imported energy became uncompetitive. So the Federal Energy Regulatory Commission (FERC) directed users of imported LNG to default. American LNG imports virtually collapsed. Contracts became much more onerous as producers wished to protect themselves.

Social Mobilisation in Bihar

Bureaucratic Feudalism and Distributive Justice

Arvind Sinha

The Bihar countryside has undergone tremendous change in the last three decades. The landed classes of the past have given way to a combination of groups – government officials, contractors, professionals, political functionaries of the ruling parties and the mafia gangs connected with them – who constitute the new ruling class. A new form of exploitation has been superimposed on the old which directly uses the state agencies to consolidate its power. Any movement directed at social mobilisation in Bihar has to confront this reality.

UNTIL the mid-1960s the situation in the Bihar countryside was characterised by abject poverty, unemployment and destitution on the part of rural masses, on the one hand, and affluence, power, and endless opportunities for the landed aristocracy, usually from the upper crust of caste society. This upper crust of the society had the support of the bureaucracy and the political leadership.

The ruling Congress Party during mid-1960s controlled by those coming from the upper caste landed aristocracy – the overwhelming majority of bureaucrats, technocrats, and professionals also came from the same background. The large section of the bottom strata of rural society, dalits, OBCs and tribals had to mortgage their freedom and dignity to the landlords because of large-scale indebtedness, poverty, dependence for their employment on the landlords. This society was, not surprisingly termed as being at 'ease', 'peaceful', well ordered'. There was no need for much political intervention, massive mafia attacks on the downtrodden because, they were 'good', law-abiding citizens, whose voice of protest could have been easily silenced.

The power relation has changed substantially today and the simple apex-bottom equation (the two poles of power and powerlessness) has now been replaced by a complex apex-middle-bottom power equation. The power-affluence combine, though reduced to a great extent at the apex has not percolated down to the bottom. Instead, it has been transferred to the hands of a new class of exploiter group which has successfully forged an alliance with them. The whole process of exploitation and appropriation has become complex.

The contractors, government officials, professionals like engineers, doctors, political functionaries of the ruling class parties and

mafia-gangs connected with them form the new ruling classes. A nexus of all these groups has emerged through a complicated process over the last three decades. At present, this nexus of exploiters is under the hegemony and dominance of politicians from the upwardly mobile middle castes.

Development, these days has become a popular and attractive slogan. The new ruling class is trying to get as much money as possible from the state exchequer, the World Bank, the IMF, multinationals, etc., in the name of development of the downtrodden and promotion of distributive justice. Most of the money, however, is pocketed by the ruling classes. Thus, we have the phenomenon of animal husbandry mafia (fodder scam), education mafia, coal mafia, timber mafia, etc.

Through this process a new mode of exploitation and surplus appropriation has been superimposed on the old. This mode of exploitation and appropriation could be termed as bureaucratic feudalism. This mode represents the exploitation and appropriation by the newly emerged ruling class. For example, in the fodder scam thousands of crores of rupees were shown to have been spent on buying fodder, medicine, etc. for the state-run animal husbandry farms and for distribution among the peasants in the Jharkhand districts of the south Bihar. Investigations, however, have revealed that only five bills were prepared and deposited showing that these items had been bought from several private firms and distributed at concerned places. It was found that bulls and buffaloes were transported on mopeds, scooters, and tractors. This has been happening for the last 20 years, though at slow pace, but accelerated during the first term of the Laloo Prasad government. Such is the process through which accumulation of wealth is taking place. At least a dozen scams in different government departments

have also come to light over the last six months.

INSTITUTIONAL COLLAPSE AND PRIVATISATION

The outcome of bureaucratic feudalism is reflected not only in surplus appropriation and halting of production, but in the overall impact over the society as being manifest in the institutional collapse of the worst kind – in education, health, electricity, housing, and other state-run civic amenities systems. The public sector option for all such services has gradually collapsed. As a result, private options for the institutional re-arrangement have emerged over the years to provide the same at a higher price (compared to the public sector low prices). Opting out for privatisation, thus, is not a choice for Bihar society. The taxpayers are paying for what they never get in return. The worst sufferers of all these processes are the dalits, OBCs, tribals, in general, and women of all these communities who just cannot think of the private options for education, health care or anything.

Privatisation as a parallel institutional system is the result of the bureaucratic mode of appropriation and under these conditions, while the affluent and middle classes (from both urban and rural centres) are able to afford the sources and amenities provided by this parallel system with divergent degrees of convenience, the rural or urban downtrodden are pressed hardest. Under these circumstances, the context for distributive justice for the poor and unprivileged can well be understood. They are completely denied their basic right to survive. Mushrooming growth of the so-called English schools and inadequately equipped nursing homes are yet other examples of this phenomenon. In gender terms, women across all classes in the rural society are becoming losers since the benefit through such opportunity normally goes in favour of men.

Does this mean that nothing positive has developed in the last three decades in Bihar? This certainly is not the situation. The caste-based exploitation and oppression, and division of labour in Bihar society has been undermined to a great extent. Now, it is not possible to oppress dalits and OBCs in the name of caste; rather the upper caste rural elites are on the defensive and in many places. This has become possible, mainly because of the changed power mosaic on the political surface which now allocates and accommodates caste-based political power in the hands of the poor, dalits, and OBCs.

Evidence of this process of social change can be traced in those areas where the downtrodden classes are fighting militant battles under the leadership of different naxalite organisations, aimed at creating material conditions for real socio-economic

justice across different classes in the society. These movements are not confined to the narrow bourgeois concept of social justice. The militant mass is staking a claim for a radical land-reform, elimination of caste-based social oppression, ending of loot of public money meant for development, and any sort of discrimination based on caste, religion, gender, etc. State response to these militant struggle, has been brute suppression of the struggling forces via local state apparatus, in general, and police machinery, in particular.

The reservation policy for dalits and BCs, in government jobs and educational institutions has played a significant role in diluting the division of labour based on caste. Previously, most of the government and other coveted jobs were confined to the upper caste which gave them a special status in rural society as well as conferring a distinct advantage vis-a-vis the state machinery. This upper caste dominated bureaucratic institution worked as the reservoir of economic and political privileges and power. Now with reservations and the control of the political power the BCs and dalits are reaping advantage and economic and political privileges are flowing towards them. In this sense, there is a wider distribution of socio-economic justice in favour of dalits and BCs in the wider social context and this is providing them with a sense of dignity and power. This development is significant.

LAND REFORMS

Disposal of land has been taking place over the last three decades for many reasons, the most important being the pressure and psyche created by social mobilisation. I would like to emphasise here the 'psyche' component of this process in the context of social mobilisation over the issue of land reforms. Until the mid-1960s the landlord's feeling of pride in their status, power and affluence based on and integrated with 'land' was pronounced. After the zamindari abolition the revolutionary organisations, for the first time, mobilised masses and became instrumental in denying the term 'zamindar' and challenging the status of the landlords, thus attacking their pride over landed aristocratic status. The term 'kisan' was frequently and deliberately used as a challenge. Simultaneously revolutionary organisations continued exerting pressure for further implementation of land reform legislations. It was because of this pressure from communist, socialist, and naxalite movements that a fraction of the whole land reforms package was implemented by the state apparatus. The landlords were forced to accept their status as 'kisans' (even if not in the de facto sense of the term, because many large landholders even now enjoy the status of a landlord). While the communist

movement accelerated the implementation of land reforms through state level, large-scale land grab movement in early 1970s, the JP movement reinforced this process under the banner of the Chhatra Yuva Sangharsh Vahini which cultivated Bodh Gaya as a pocket of struggle against the Math. The naxalites went on a long protracted struggle, and expanded and promoted the overall process.

However, the communists after the land grab movement, deleted this issue from their agenda and later on abandoned it altogether. The socialists went into the Janata Party/Janata Dal, merged with ruling party politics and finally dropped the land reform issue. Their mainstay became reservation politics – an extension of distributive justice to the social sphere. Only the naxalites sustained a protracted struggle over land distribution.

Here one can find a strange dialectical relationship between the revolutionary movement and the government-sponsored land reforms. One of the outcomes of the partial success of the land reforms programme was that the landlords began to diversify their resources into extra-agricultural activities – in business, building construction, co-operative societies, etc. Diversification towards market 'profit' and not 'prestige' became their preference. The spring thunder of naxalbari found an echo in Musahari block of Mazaltarpur district in the north Bihar, generating hopes in the hearts of the downtrodden and fear among the landed aristocracy that shook the entire system. The exploitation and oppression by a section of the intelligentsia and the landlords was so palpable that even the state could not come to their rescue and was forced to enact land reforms laws under Indira Gandhi's 'garibi hatao' slogan. The turn of historical events forced even reformists like Jaiprakash Narayan to concentrate on Musahari and to promise a peaceful revolution which could give land to the tillers and emancipation from oppression of the downtrodden. So, land reforms were not a gift by the ruling classes to the poor in the countryside but a part of their strategy to 'sacrifice a part to retain and safeguard the whole'.

In a protracted process of different variants of the class struggle in rural areas, land distribution took place to a certain extent but the process is yet largely unfinished. The redistribution led to increase in land productivity and elevation of some marginal peasants and landless to the level of the small and middle peasants. The process of caste/class struggle has led to a situation in which the semi-feudal hold and control over the lives of the poor greatly loosened; consequently, one can find today a much more free and mobile social environment among the rural masses.

This free environment accelerated the process of labour out-migration from the

countryside to the newly developed regions of Punjab, Delhi, Haryana, and western Uttar Pradesh. Previously, the out-migration from Bihar was eastward towards Calcutta, Assam and beyond. Now, it is the westwardly located labour deficit areas which attract the labour so much so that even trains running from Bihar are named 'Shranjeevi' (those who survive on manual labour) and 'Shramshakti' (labour power) Express. There is a sharp difference, however, between then and now. Then, the landlords' control over the lives of the migrant labour was enormous through indebtedness so that what they brought back home was taken away by the semi-feudal appropriators. Now, because of the newly achieved freedom in the countryside money is being invested in buying plots of land, or constructing small houses or providing education to their children and thereby enhancing their socio-economic profile. Now they are consuming more than before, thereby strengthening market forces at local levels. The new conditions have led to greater integration of the labourers into the national labour market. This integration has also accelerated the market process in the local rural areas. Changes could well be noticed in landholder's priorities also. They now do not prefer big landholdings, but more productive holdings.

All these positive changes with respect to distributive justice over the last three decades are the outcome of complex interaction among the political, social and economic forces in society, in which the political movement of the downtrodden has played the most important role. The rural poor with the dream of a better life and better future for their coming generation have been questing for avenues which could lead them to realise their dreams. The different shades of the left, democratic movements are the outcome of this quest. Though illiterate, they had the intelligence and capability to see that the ideology of the left was suited to them to proceed towards their goal. The basic driving force behind all these movements remained the aspiration of the toiling millions for creating social conditions that could provide them with free and decent life. It is this aspiration which gave stability and strength to the first tenure of Laloo Yadav (when it was a minority government), as he was seen as the 'messiah' of the downtrodden.

Bihari society, in general, and the rural society, in particular, has transformed from a quasi-solid state into a fluid state impinging upon those solid structures of the system which continue to exploit and oppress the masses. But as these processes are going on, the exploitative socio-political economic system has created malices to thwart the process of change in society which might usher in an era of socio-economic justice for all. The ruling classes have co-opted a section

of the political leadership from the BCs and dalits into this system. As a result the hope BCs and dalits of providing political leadership and entering bureaucratic, technocratic and professional counterparts of the system, mainly via reservation policy, are reduced to ashes. This social formation, in my opinion is a malformation in the process of change. Thus, the bureaucratic feudalism is not a healthy and developed formation but a malformation which is blocking the spontaneous flow of a process of social change and thereby, is sabotaging the process of distributive justice as well.

Now the question before the forces of progress, change, and distributive justice is how to cope with this malformation, how to defeat this newly created obstacle in the way of freedom and justice for all?

[This article is a revised version of a paper presented on behalf of *Shoda Madhyam*, a Patna-based research-cum-Media centre, in a workshop on the issue of 'Social Mobilisation and Distributive Justice' held at the Gandhian Institute of Studies, Varanasi on March 19-20, 1996. The workshop was sponsored by the ICSSR. My thanks are due to Indu Sinha without whose insistence and co-operation this article was hardly possible to write.]

Protecting Health Care Consumers

Is CPA Effective?

Arun Bal

The Consumer Protection Act can effectively protect the rights of health care consumers only if the agencies set up to process grievances can be made to function efficiently.

THE Consumer Protection Act, 1986 (CPA) provided a glimmer of hope for the consumers of the health care in India. Avenues of redressal available to the consumers before enactment of the act were time consuming, costly and often counter-productive. The enactment of the legislation act raised the hopes of the consumers. The provisions of the act are radical and delay in resolving the complaint is sought to be reduced dramatically. The cases of medical negligence which used to take anywhere between five and 15 years are expected to be completed in the span of a few months. Consumer organisations working in the field of health care also gave their wholehearted support for CPA. However, today three years of experience with the redressal machinery has dampened their enthusiasm. The fierce resistance of the medical profession has in fact created more awareness amongst the consumers about the act and its applicability to the medical profession. The verdict on the Indian Medical Council's writ petition before the Supreme Court of India in November 1995 set at rest many of the objections of the medical profession and tried to eliminate discrimination by bringing in the ambit of the CPA government and semi-government hospitals which offer paid services along with the free services.

ACASH has been handling the consumers' complaints on health care from its inception. Earlier these complaints were processed under various existing acts like Drugs and Cosmetic Act, Medical Council Act, etc., and often under civil laws. After the enactment of CPA, there was no awareness about the applicability of CPA to the medical profession

till the judgment of National Consumer Commission in 1992 in *Vasanta Nair vs Cosmopolitan Hospital*. ACASH receives complaints directly or through other consumer organisations who refer complaints to ACASH because of the expertise needed to handle and process the medical complaints. Complaints are also referred to it for primary verification. The method of handling the complaints is standardised. The written complaint is scrutinised and the details are confirmed by interviewing the complainant. Many of the details not recorded in the complaints and many a time vital information needed to arrive at the correct decision is elicited in the interview. The documentation is checked and if found inadequate the complainant is advised to collect the requisite documents. This involves prolonged correspondence with the doctor/hospital. After the documentation is complete the complaints are sent to experts for opinion in the same field. Depending upon the opinion, legal steps are taken. The complaints from other organisations are referred back to that organisation for further legal process. Certain observations may be made based on our experience.

Many complaints are found to be instigated by the other (competing) health care providers. Many a times the person or the institution indulging in such an unprofessional behaviour can be identified while interviewing the complainant. This is sad commentary on the level of professional ethics in the country. Consumers are put to unnecessary trouble due to such complaints which usually has no substance.

In majority of the complaints the main

grievance is about the behaviour of the doctors. Complainants are agitated about the rude behaviour, non-disclosure of the vital details of the treatment, investigation, diagnosis, etc. Many times explanation by ACASH staff has satisfied the complainant resulting in a resolution of the grievance. Again this is a sad commentary on the training of medical professionals in the country. The profession whose practice is based on communication with the patient seems to have lost the sight of this fundamental fact due to pernicious commercialisation and emerging mercenary attitude amongst the medical profession in the country. Proper training of the doctors in communication techniques can eliminate many grievances.

Many complaints arise because of ill-equipped private nursing homes, non-availability of blood, poor ambulance services, untrained/partially trained nursing staff, etc. Serious efforts need to be undertaken to improve these facilities. Unfortunately the medical profession, whose members are handicapped due to the poor infrastructure, is usually silent on this issue. The profession has seldom supported consumer organisations in their campaign for rational drug therapy. Similarly the profession is always silent about poor quality medical equipment. The recent episode of adulterated cotrimaxazole from Boehringer Mannheim also did not spur the medical profession into any sort of action.

The issue of correctness of the treatment given to the patient often rests on the available standards of the treatment. However the standards, used in the country are usually western and many a times not applicable to the Indian situation. In the absence of Indian standards courts have to depend on the western standards. This can be a problem for both consumers as well as the medical profession.

Record keeping in the health care sector is very poor. Vital records are sloppily maintained; consent is taken in an incorrect manner and informed consent is practically absent. The record of anaesthesia is usually not found in the medical record. The patient does not receive the record copies at the time of discharge. According to a landmark decision given by Bombay High Court, the patient or his legal heir has the right to get the copies of the entire medical record on payment of reasonable charges (*Writ Petition No 3720/91 Raghunath Raheja vs Maharashtra Medical Council*). Proper record keeping by the profession and more awareness on the part of the consumers about the medical records can help both the consumers as well as the medical profession.

A majority of the complaints involve surgical procedures; in such cases the pre-operative anaesthesia assessment is vital. However in the private practice set-up such

a necessary part of the patient care is usually not included. This causes problem as often the pre-operative findings are not even recorded

In some complaints the unnecessary use of hi-tech equipment or investigations causes some complication or increases the cost of the treatment significantly leading to a grievance on the part of the consumers. We have come across one complaint of internal piles operation done along with cholecystectomy at the same time when the gall bladder was found to be perfectly normal. The cholecystectomy was done by laparoscopic method. Indiscriminate import of such high technology equipment with significant financial input creates economic pressure on the doctor/hospital leading to such grossly unethical acts. There is an urgent need for developing guidelines on the use of such hi-tech equipment. At present anybody with the financial backing can import the equipment and use without any restriction.

The Bombay Nursing Home Act has been in existence for the last 35 years. However, most of 1,200 nursing homes in the city of Bombay are ill-equipped and inadequately staffed. There is an urgent need for developing an effective regulatory system and introduce categorisation of medical institutions.

As per the administrative order/guidelines of the president of National Consumer Redressal Commission to all the state commissions, the complaints filed against the medical profession must be accompanied by expert opinion stating that the complaint is prima facie true and needs further investigation. This step was taken by the commission to prevent harassment of doctors. However consumers are unable to get such expert opinion from other doctors as they are wary of giving such written opinion even in deserving cases due to the prevalent atmosphere in the private sector medical practice. Some deserving cases have been dismissed by consumer courts for the want of expert opinion because doctors are usually unwilling to disclose their identity while giving the opinion. ACASH along with Forum for Medical Ethics (FME) has set up an expert panel. The idea is to obtain the opinion of the experts, whose identity can be revealed only in the court. The practical aspect based on which such a scheme was devised is that many complaints are not fit to be taken to court. All the same the expert opinion has to be obtained. If the case is found not fit to be taken to the consumer court then the expert's identity is many a times used by the involved doctor to harass the expert professionally. Consumer courts

in Maharashtra have been reluctant to refer cases for the medical opinion to government hospitals or medical colleges.

Consumer courts have belied the expectations of the consumers. Many of the district fora have not been functioning and the Maharashtra State Commission is without a president for the last six months. The delay in disposal of cases is up to four years. In one instance, the transcript of the oral judgment was lost by the stenographer and the president could not recall the details. The Maharashtra State Commission has inadequate staff. The existing staff is from the civil supplies department and is usually unaware of the legal formalities. There have been allegations of corruption against the staff. If the functioning of these courts is not improved consumers are likely to lose faith in them very soon and these courts are likely to go same way as Co-operative Courts or Motor Accident Tribunals.

The Consumer Protection Act is a radical new step towards the protection of the rights of the consumers. However, the act like any other legal remedy for social problems needs to be used judiciously. The inherent principle of CPA is system correction. However the system can be rectified if the drawbacks in the functioning of the act are eliminated by sustained efforts by consumer organisations.

New from Oxford

Culture & Psyche

Selected Essays

Sudhir Kakar

This book is a collection of Sudhir Kakar's essays on cultural psychology, a discipline which studies the interplay of culture and individual psyches. Professor Kakar draws upon his rich experience as a practising psychoanalyst and attempts a study of Indian identity through sources as diverse as case studies, Indian myths and legends, and popular cinema. While most of these essays have earlier been published in leading international journals, the book also contains two that have been written specifically for this volume.

Writings on Development

Sukhamoy Chakravarty

Of the twelve essays in this volume, nine are concerned primarily with theoretical issues but are replete with references to important features of economies in their development process. Three essays focus on issues specific to the Indian economy, with much of the discussion focusing on the applicability of alternative approaches in the Indian context. Mihir Rakshit's introductory essay traces the roots of development economics, discusses various strands in the literature and highlights Professor Chakravarty's contribution to it.

The Present History of West Bengal

Essays in Political Criticism

Partha Chatterjee

This volume is a collection of academic writings, lectures, reportage, and editorial comments on the politics and history of Bengal, a subject both irreducibly historical and irreducibly contemporary, by one of the most perceptive observers of our time. Is it possible to write history alongside historical events? That is the question the author tries to grapple with in these essays which study patterns of agrarian transformation in West Bengal and Bangladesh.

Land Alienation in Tirunelveli District

Anand Pandian

The prevailing economic climate, new government incentives for agro-based investment and a fashionable discourse of environmental protection have combined to produce a wave of investment in the rural areas of Tamil Nadu. But where are these large blocks of land coming from? Who is giving up the land?

'VANAMKAATHU VALAMPERUVOM'. 'Protecting the forest, we will prosper', declares Sterling Tree Magnum in a bid to lure investors into their teak plantation schemes. The communication media of urban India are saturated these days by calls for investment in tree-plantation schemes of all kinds. Feeding on the security needs of the newly enriched middle-class, companies such as Sterling, Anubhav and VGP promise both financial security – safe, stable investment – and environmental security – a role to play in the reforestation of India. 'Growth, ecology, and security' is the motto of another one of these companies, calling itself Mother Earth Plantations. The prevailing economic climate, new government incentives for agro-based investment and a fashionable discourse of environmental protection have combined to produce a wave of investment in the rural areas of Tamil Nadu. But where are these large blocks of land coming from? Who is giving up their land for the benefit of these investors? And how are we to understand the social and environmental impact of such investments? To begin to answer these important questions, it may be worth focusing on what is happening in one small area of Tamil Nadu, south-western Tirunelveli district.

Kalakad and Cheranmahadevi blocks of Tirunelveli district have important belts of fertile wetlands supporting high yields of paddy and banana cultivation. Nestled against the eastern foothills of the western ghats mountain range, villages have been able to channel rainwaters and water from the rivers and streams running off the mountain into irrigation tanks to support such cultivation. However, these same mountains prevent the south-west monsoon from raining down on the region, so that the landscape is dominated by unirrigated dry lands. Supporting a low growth of grasses, thorny shrubs and the ubiquitous palmyra palm, these drylands can be found on the outskirts of each of the villages in the area. It is the ownership and usage of these drylands that has changed so dramatically in the last few years.

Thousands of acres of drylands have been purchased from local hands by outside parties in the last five years. In many villages such as Chidambarapuram and Ulagankulam these lands were mainly small holdings of less than five acres that were consolidated

and sold by land brokers. In other villages such as Therku Karakurichi, large landowners transferred several hundred acres of land all at once to outside parties. Tenipule lands have also been an important component of the sold lands in many villages.

"Acquiring the land is crucial but tricky as one must convince the villagers to part with their land", says N V Rajan, general manager of Maxworth Orchards, a sister concern of Sterling Tree Magnum, dedicated to horticultural plantations (Goutam Ghosh, 'Harvesting a Fortune?' *The Hindu*, January 28, 1996). The companies work mainly through local land brokers who are able to convince villagers to sell off their land. In the Cheranmahadevi area, small landholders cite many reasons for having sold off their lands, chiefly claiming that keeping them is 'useless': *tharisaathan erunthathu*. Most of these lands had been cultivated with rainfed dryland crops such as kambu, cholam, ragi and groundnut in past years. Local farmers feel that rainfall has become more erratic in recent years, making such cultivation a risky venture. Moreover, in the expansive strip of drylands between the villages and the mountain forests of the western ghats, crop depredation by wild elephants and wild pigs has become a serious problem in recent years. Many farmers have thus been forced to abandon their groundnut, millet and gingelly crops. Local land brokers have been able to convince landowners that rather than keeping these lands 'tharisu' – unused, uncultivated – they are better off selling them for cash. One tactic commonly used is to tell individual families that everyone else around them has sold their lands, so they might as well sell theirs too because they will be cut off from it anyway.

Local villagers report almost unanimously that their lands have been bought by 'Keralans'. It is difficult to verify the identity of the purchasers, however, because all transactions are conducted through land brokers. It appears that there are two kinds of parties purchasing land in the area: wealthy individuals and corporate entities. Individual parties have purchased substantial numbers of 20-50 acre tracts for tree plantations and other estates in the region. Many are business people and government officials from the neighbouring state of Kerala, while many parties from Madras and local wealthy

families have followed suit most recently. The category of individual parties also includes a few men who have gone abroad to Saudi Arabia and other countries for work and have since returned to purchase blocks of land. One non-resident Indian of local origin now residing in the US has thus purchased 150 acres of land in Karisalpatti for tree plantation. Associates of the current government in Tamil Nadu have also purchased hundreds of acres of land in different blocks of the region.

The large-scale capital-intensive corporate plantations are the other main category of investment. Some of these are investor-based schemes such as those referred to earlier. Sterling Tree Magnum, for example, has a total of 950 acres of teak plantations in Karakuruchi, Panagudi and Pallivasal. Others are adjuncts to larger corporate groups, such as the 150 acre plot operation by Enfield Agro-Base, a subsidiary of the Enfield motorcycle company. Prabhu Farms, said to be a concern of a Coimbatore-based industrial group, has purchased thousands of acres of dryland adjoining the mountains from Pulavankudieruppu (10 kms south of Cheranmahadevi) all the way to Ambasamudram. Sun Paper Mills of Cheranmahadevi has fenced off a vast area to grow eucalyptus and acacia sp for their raw material needs.

The most important reason for the high levels of land purchase in this region has been the low price at which buyers have been able to access lands. When the wave began a few years ago, land could be purchased for as little as Rs 2,000-3,000 per acre, and these same lands have seen a five-fold increase in price to Rs 10,000-15,000 per acre today. The rapid appreciation of land value has encouraged some to purchase land simply for speculation, leaving it as it is and anticipating selling it off at a much higher price in the future. For the most part, however, purchasers are fencing off their properties for various commercial tree plantation: teak, coconut, guava, cashew, casuarina and other fruit trees are the species found commonly. Some parties have also developed intensive fodder farms: the Church-affiliated Assisi Farms, for example, is raising cattle and fodder grass on 200 acres in Pottal and Ulagankulam.

VALUE OF 'WASTELAND'

Local opinions of these recent land purchases are decidedly mixed. Many youths welcomed the additional employment opportunity. Many of the smallholders who had sold their land accepted the sales, claiming that they needed the money for pressing family expenses. Other sellers registered a stronger sense of futility in their decision, acknowledging that retaining the *tharisu* land was indeed useless and they could do nothing but sell. Some expressed anger at the government loans and subsidies that seemed to be flowing to the large plantation owners

to develop these properties while they themselves were unable to make the necessary investments to cultivate them. However, the strongest sense of opposition to these sales came not in terms of individual landowners expressing the loss of potential to cultivate but in terms of local villagers expressing concern over the loss of de facto rights to use lands that were not necessarily registered in their name. In fact, in many of the villages of this area, these private drylands in question constitute the bulk of 'common property resources' available.

When encouraging villagers to sell their drylands, land brokers equate 'uncultivated' with 'useless', arguing that there is no point in keeping these lands in such a state. The low economic value and degraded condition of these lands earns them the title 'wasteland' from those interested in 'developing' them. However, if the village is considered as an agro-ecosystem with distinct and inter-dependent parts, the crucial role played by uncultivated lands in rural ecology and economy becomes clear. Though the bulk of income in these villages may come from wetland cultivation, the biomass resources harvested from the uncultivated drylands are essential to rural life. Cattle and sheep graze on the grasses and scrub. Leaves from shrubs and trees are cut to feed goats, and to fertilise fields. Branches of the abundant 'karuveli' (*prosopis juliflora*) and other thorny shrubs are the most easily accessible sources of domestic fuelwood. Jaggery boiled down from the nectar of the palmyra palm provides country sugar, while the leaves are harvested for thatch and other cottage industries. Sand and soil are gathered for building material and brick kilns. Hare and other small animals are hunted as a supplemental source of protein. Local villagers have identified tens of plants with medicinal value that grow in these drylands.

With recent prohibitions on the use of mountain forests and privatisation of government 'poromboke' lands, villagers have come to depend on this 'patta kadu' for these essential biomass resources. It may be useful here to look historically at the fate of 'common property resources' in this part of Tamil Nadu. How is it that villagers have come to depend so fully on lands that they have no legal right to use?

In his excellent history of peasant society in Tirunelveli, David Ludden notes the existence of strong traditions of collective right to drylands and grazing and wooded land on the outskirts of wetland cultivation in Tirunelveli district. Over the course of the 18th century, however, negotiations between the British colonial government and local landowners and tenants produced a rigid division between private cultivated lands and uncultivated lands belonging to the state. In an effort to maximise land revenue, the colonial government declared all uncultivated lands as 'waste' belonging in principle

to the government; large landowners were encouraged to purchase 'pattas' for the rights to this land from the government. Meanwhile, in villages with extensive dryland cultivation, single landowners were able to secure pattas for vast areas of land cultivated by small farmers; the latter became 'tenants' with limited rights to the land they were tilling [David Ludden, *Peasant History in South India*, Oxford University Press, 1985].

After independence, the Indian government sought to reduce rural poverty by breaking up large zamindari estates and redistributing this and other poromboke lands to landless peasants. However, this process further reduced access to common lands. Moreover, while much of this land did not end up in the hands of landless peasants, many of those who gained rights to land were forced to sell them off again for various economic reasons. As N S Jodha describes:

The complete process of privatisation of common property resources (CPRs) as it affected the rural poor involved three stages:

(i) they were deprived of their right to collectively use the CPRs, (ii) they were given individual title to small parts of privatised CPRs, and (iii) the circumstances disentitled them of the newly received lands (N S Jodha, 'Common Property Resources and Rural Poor in Dry Regions of India', *Economic and Political Weekly*, Vol XXI, No 27, July 5, 1986.)

The scarcity of government poromboke lands in many of the villages in the Kalakad and Cheranmahadevi area can be attributed to this process. In many parts of Tirunelveli, we now see the culmination of this process through the current wave of land alienation.

The nearby mountain forests of the western ghats add another dimension to this history. The villages of the Kalakad and Cheranmahadevi areas had historically depended a great deal on these forests for fuel, fodder, manure, small timber and other resources. However, by 1895 most of these forests were notified as reserves by the colonial government to control local resource exploi-

tation, and to ensure a steady supply of timber for the railways and shipbuilding industry. In south-western Tirunelveli, rights to forest use were further restricted by the Indian government's notification of the Mundanthurai and Kalakad Wildlife Sanctuaries in 1962 and 1976 respectively. These rights were eliminated altogether with the notification of a tiger reserve in 1988, prompting important changes in local village economies. Cattle grazing in the forest was reduced substantially, as was the collection of fuelwood and non-timber forest products for sale, green manure for agricultural fields, green fodder for livestock and hunting. The loss of forest-based labour accentuated employment scarcity in the villages, contributing to outmigration for employment. The closure of forests to cattle made it difficult for graziers to care for such large herds, and thousands of cattle were sold off. The impact of forest closure spilled beyond the reserve boundaries, as crop-raiding wild pigs and elephants inhibited cultivation on the drylands near the reserve.

SOCIO-ECONOMIC IMPACT

With little access to the reserve forests and the scarcity of government poramboke lands, the private drylands now under question have become the major source for biomass resources in local villages. Though private, their run-guarded condition as uncultivated fallows allows these lands to function as implicit commons. Therefore, the socio-economic impact of the sale and subsequent fencing of these lands by their new owners is felt most keenly in the further restrictions on biomass availability. Once the lands are fenced off and cleared, villagers lose access to the natural resources on which they had depended.

Consider grazing, for example. When the tiger reserve was notified local herds were greatly reduced to accommodate the reduction in available grazing lands. But now most of the fallow drylands immediately adjacent to the tiger reserve have been purchased and enclosed by fences. This has affected not only grazing on these lands but also illicit grazing on the mountain forests beyond. The small reserve forest hillock of Man Pothai, for example, is almost fully ringed by large private plantations that cut off access routes to its slopes. Moreover, many of these new estates have encroached upon and enclosed poramboke lands adjacent to their own, often with the connivance of local government officials. For example, Sankar Farms, owned by a retired Kerala government official, has 500 acres of tree plantations in Ulagankulam: 300 acres of patta land and 200 acres of encroached poramboke that had previously served as a grazing ground. In the village of Malayedipudur, cattle-owners joined together and prevented the local temple from selling off their lands on the grounds that

these were important grazing commons. However, such resistance is exceptional and uncommon.

Confronted with grossly restricted grazing grounds, the number of cattle retained by villagers has been reduced even further. Villages such as Reddiarpuram, Chidambarapuram, Veeravannalur and Pallivasal have sold off up to 80 per cent of their remaining cattle herds, with many families retaining only a couple of bullocks or milch animals that can be stall-fed at home. These reductions along with reduced access to leaf manures have decreased availability of organic fertilisers for wetland cultivation. Provision of milk to children in marginal households may also be compromised. The greater difficulty in gathering other biomass resources such as fuelwood burdens women much more than men.

Company spokesmen defend their new plantations as a source of income and work opportunity for villagers. R Subramaniam, managing director of the corporate group that includes Sterling Tree Magnum, argues "We are not only transferring funds from the urban rich to the crucial farm sector, but we are also giving the farmers purchasing power" (Goutam Ghosh, 'Harvesting a Fortune?' *The Hindu*, January 28, 1996). However, the ultimate utility of the money given to local people in exchange for their lands is questionable. Some families use the money to meet economic necessities such as dowry, debt repayment or even feeding the children in times of work scarcity. Others make their investments in consumer goods or liquor. Although in some villages such as Veeravannalur a few farmers sold 10-15 acres of dryland and reinvested the money in a couple of acres of irrigated wetlands, there is little evidence to indicate that sellers have been able to make long-term use of the money gained from the sale.

As the purchased lands were uncultivated, the new tree plantations have probably increased wage labour availability in an area where employment is seasonal and scarce. Many of the estates are reported to take advantage of local unemployment to offer very low wages, as low as Rs 15 per day for men. Sterling Tree Magnum employs 300 men and women from eight local villages at its Karakurichi plantation in year-round wage labour. Men get between Rs 19 and Rs 31.50 per day, while women's maximum salary is Rs 25 per day. These workers are put to weeding, managing the drip irrigation system and applying pesticides, but it is clear that many of the available work opportunities are short-term, restricted to the care of young seedlings. The loss of income due to cattle sales must also be considered when evaluating the impact of the plantations on local labour conditions. Additionally, it is important to note that agro-corporations have the ability to draw on outside labour pools to maximise their profits. Thus, in the village of Kuniyoor,

50 local men and women lost their source of wage labour when a coconut garden was recently sold to an outside party that has imported workers from Radhapuram taluk.

Palmyra-climbers are another affected population. The drylands in question were habitat for a substantial number of palmyra palms, often more than a few per acre. Palmyra-climbing and processing of palm products was the main source of livelihood in many of these villages till recent years. This seasonal source of income was especially important as the tree fruits during the summer, when wage labour is more scarce. However, as this is difficult work with low esteem among villagers today, many families have been shifting from this to other occupations. Owners of palmyra-laden lands have complained of a lack of climbers and a lack of profits in the enterprise, cutting down their palms for sale to brick kilns or for construction. When the lands are subsequently sold to outside parties, the new owners typically cut and sell the remaining trees. A substantial number of families who still depended on the palmyra for their livelihood has lost this seasonal source of income. In Pallivasal as many as 30 families have been impacted in this manner by the recent sale of palmyras and the lands on which they stood to Sterling Tree Magnum and other parties. Though in most cases the owners of the land and the tree-climbers are distinct, in some cases families sold off palmyras which they used to climb themselves. An old man of Pallivasal who had climbed the palms for the last 28 years sold off his 4.5 acres last year for Rs 50,000 out of economic necessity and in anticipation of a better life. The money has now been spent and he, like most of these families, depends on agricultural labour for a living.

Keeping all of these issues in mind, we may turn to the environmental concerns with which this article began. The greening of barren 'wastelands' certainly sounds environmentally appealing. Many environmentalists may also applaud the sale of herds of country-bred cattle – known derisively as 'scrub cattle' – due to closure of grazing lands as a means of reducing human pressure on natural landscapes. Several forest officers in the region approved of the tree plantations as a further 'buffer' between local villages and the forests of the tiger reserve. Indeed, in villages like Chidambarapuram, the enclosed plantations have cut off several routes through which villagers had illegally collected fuelwood and other products from the reserve.

However, a growing body of evidence suggests that environmental conservation cannot be evaluated without reference to the socio-economic conditions prevailing in that area. By further disrupting the agro-ecosystems of the region, the enclosure of these drylands may augment the resource insecurity of the rural poor, encouraging

more unsustainable use of natural resources in the long run. M S S Pandian has documented some of these dynamics in the neighbouring region of Nanchilnadu, in eastern Kanyakumari district. There, the reservation of forests and the conversion of drylands into wetlands destroyed the physical balance between crop and non-crop land. Peasants were made dependent on the market for manure and other agricultural necessities harvested previously for free from common lands. The result was usury, debt and further land alienation (MSS Pandian, *The Political Economy of Agrarian Change: Nanchilnadu, 1880-1939*, Sage Publications, 1990.)

The most vital common property resource at stake in this case may be groundwater. The shift from 'panaikadu' to commercial tree plantation signals a major socio-ecological change from rainfed to groundwater-based cultivation. Though many of the large plantations such as Sterling Tree Magnum and EABL are using drip irrigation, the pumpsets they have installed draw water 24 hours a day for their tree crops. At the STM plantation in Karakurichi, for example, water is drawn from 16 open wells and five borewells in eight-hour blocks to water the trees. In this semi-arid region with sparse rainfall, the groundwater table has already dropped in some locations as a result. Increasingly, wealthy local farmers will find themselves in a race to deepen their wells to reach the receding groundwater first, as poorer farmers are left behind.

Groundwater overuse is enough of a problem. But when this water is used to grow biomass purely for the market on lands that had previously supported the biomass needs of the local people, an environmental justification for the plantations seems quite dubious. Moreover, the monocultural tree crops replace a diverse - though admittedly often degraded and overused - array of native shrubs, grasses and other plants. The benefits of these plantations for biodiversity conservation are therefore also ill-founded. The commitment these outside parties have to the local environment is equally questionable. Sun Paper Mills dumps tankloads of sewage sludge from its mill on their vast property south of Cheranmahadevi all 24 hours, to bake in the sun and seep into the groundwater table. Despite foresters' faith in the tree plantations as a buffer for the tiger reserve, it is entirely possible that some of these companies will take advantage of their privileged location to cut into the forests of the reserve as they harvest their own trees.

These observations are not meant to defend the existing condition of dryland resources as ideal. Clearly, low income from land resources on the one hand and degradation due to overuse of stressed ecosystems on the other are significant problems in many of these villages. But 'growth, ecology and security' as promised by Mother Earth

Plantations should not come at the expense of local communities. Are there any other means to restore the diversity and productivity of these lands in a manner more consistent with the resource needs of local villagers?

The government of India may not think so, judging by attempts in the forestry legislation now being drafted to turn 'degraded forest lands' over to agro-corporations for plantation work. However, the work of non-governmental organisations (NGOs) such as the Social Forestry Information Project in Devadanapatti suggests that small landholders can be successfully united to develop their dryland resources sustainably and collectively for local benefit. Flexible strategies of wasteland development can be evolved to meet the priorities and resource needs of rural villagers rather than urban investors. Mixed agroforestry and silvi-pastoral systems may combine annual crops, fodder grasses, and trees for fruit, timber, fodder and fuel in varying proportions. Such

landscapes could be ecologically useful as habitat for diverse flora and fauna, while watershed development strategies could make more efficient use of scarce water resources. The government incentives and subsidies now fuelling the wave of urban investment in rural drylands can be rechannelled towards responsible NGOs and village organisations to catalyse such an alternative 'wasteland development' strategy. It may be too late to adopt such a strategy in south-western Tirunelveli. However, the enclosure of the last of the commons in this region should serve as a lesson on the importance of addressing this problem soon in future development work.

[This research was conducted during the 10 months the author was volunteering with Community Action for Social Transformation (CAST), a non-governmental rural development agency working in 45 villages of Kalakad and Cheranmahadevi blocks, Tirunelveli district.]

Ghulam the Grim: Requiem for a Despot

David Philip

This is a chilling account of the rise of Ghulam Ishaq Khan, the former president, in Pakistan's politics. In close nexus with the army, the financial banking elite and the heroin mafia, Ishaq Khan was able to tighten his grip over the country's destiny through various clandestine activities. Though now retired, his nefarious legacy haunts Pakistan's democracy.

You can't hide the evil smell
Of evil-smelling things
Though wrapped up in a hundred veils
An onion won't be hid

—Kushal Khan Khattak

IF the famous bard of the Pathan tribes that inhabit Pakistan's rugged north-west frontier had been alive last winter, his nose would have been twitching vigorously. On the evening of February 9, 1993, a giant C-141 US military transport plane circled in the frosty darkness above Peshawar, 25 miles east of the fabled Khyber Pass. Huddled in the aircraft's cavernous belly were 65 battle-ready troopers of the elite Green Berets. After landing at a nearby airbase, the commandos boarded four Pakistani helicopters. Minutes later, they were whirring their way towards Cherat, a frequent staging point for operations into strife-torn Afghanistan.

Pakistani army chief, General Abdul Waheed claimed the US troops were merely taking part in a routine joint exercise with units of Pakistan's Special Services Group. But it smelled like an Alaskan-sized onion.

What were American military personnel doing in a nation to which the US had suspended aid in October 1990 for continuing to develop nuclear weapons—a nation which Congress had put on watch for involvement in international terrorism only the month before. Why did the supposedly 'routine exercise' just happen to coincide with the arrival in Pakistan of agents from the drug enforcement administration and FBI? And why did the intrusion of US troops on foreign soil draw so little attention from the US media?

Was the operation's real objective the retrieval of an estimated 300 left over Stinger missiles supplied to Afghan Mujahideen to fight off the Russians? Or was it, as rumour had it, the opening shot in a campaign to depose Gulbuddin Hekmatyar, the rabidly anti-American Islamic fundamentalist whose troops were fighting for control of the Afghan capital? Or perhaps it was an attempt to forcibly extradite Aimal Kansi, a young Pathan alleged to have shot to death two CIA officials at a traffic intersection in the US some years ago. The Green Berets should have left Pakistan in March but for all,

anybody knows the roving Rambos could still be cooking K-rations anywhere from Kabul to Karachi.

In the lawless no-man's land that Pakistan has become, few explanations seem implausible or impossible. It is a country whose internal and external intrigues provoke questions and more questions. Though individual events have come to light, the larger story of Pakistan's descent from a relatively respectable third world power into a virtual criminal state is harder to assemble. It's worth the effort because the consequences far transcend Pakistan's own limited sphere of geo-political influence.

It involves, for instance, the \$20 billion BCCI swindle, the continuing export of massive quantities of heroin to the west, and a narrowly-averted nuclear war between India and Pakistan. As well, there is evidence to suggest that Pakistan's anarchic north-west Frontier has provided safe haven for Islamic terrorists responsible for last February's bombing of New York's World Trade Centre.

Not far from where the American commandos landed is the birthplace of a man who knows far more about Pakistan's murky affairs than he would ever care to admit. Though he remains relatively unknown in the west, Ghulam Ishaq Khan, the wily 78-year-old bureaucrat who resigned as Pakistan's president in July, has wielded as much, if not more, power than either Benazir Bhutto or Nawaz Sharif, Pakistan's last two prime ministers, since coming to office in 1988. Indeed, as a member of every civil and military administration since 1961, his political longevity in the often murderous world of Pakistani public life has been remarkable. In a nation where political power is the jealously-guarded preserve of traditional elites, Ishaq Khan's ascent has been even more extraordinary.

Though his public persona has been that of a disinterested public servant who goes by the book, a closer examination of the record reveals something quite different. Behind the thick glasses and impassive demeanour of Ghulam the Grim, political opponents would dub, lay a political will of Machiavellian ruthlessness.

Given his influence and the usual panegyrics to public figures in this part of the

world, biographical details are few. Born in Bannu, in the heart of what would later become Pakistan's heroin heartland, Ishaq Khan, an Ismaili Pathan, graduated with a science degree from Punjab University, joining the civil service of his native North-West Frontier Province (NWFP) in 1947. A decade later, he moved to the more prestigious national civil service. Married with one son and five daughters, he benignly cites economics as his only outside interest. Certainly, his concern with money and the power it could bring was much more than passing.

By the early 1970s, the future president's career had become inextricably intertwined with another Pakistani with an interest in things financial—Aga Hassan Abedi, the diabolical genius behind the Bank of Credit and Commerce International. Abedi had started United Bank, his first independent banking venture, with a \$2 million loan from textile-magnate Mian Yusif Saigol, head of one of the most prominent of Pakistan's elite 'Twenty-Two Families'. But soon the Saigols were borrowing heavily from their own bank. When Abedi opposed further loans, the Saigols threatened to oust him. Abedi appealed to Ishaq Khan, now head of Pakistan's State Bank, who intervened on his behalf.

The advent of the socialist regime of Zulfikar Ali Bhutto posed a far more serious threat both to Abedi and the elite families he represented. In 1972, Bhutto nationalised all Pakistan's banks and, at one point, had Abedi placed under house arrest.

By 1977, however, resentment against Bhutto was pervasive, especially in the military. The prime minister suspected a coup and was about to move against the army leadership. He told Ishaq Khan, now defence minister, who informed army chief of staff Ziaul-Haq. Zia promptly had Bhutto arrested and eventually executed. Thus, did Ishaq Khan secure his own future in the Zia decade to follow while earning the lasting hatred of Bhutto's daughter Benazir.

The man who actually placed Bhutto under arrest, Lieutenant-General Fazle Huq, would also come to play an increasingly sinister role in Pakistan's evil metamorphosis. In 1978, Zia appointed Huq, one of his closest friends, as governor of the NWFP through which an estimated \$3.3 billion in arms and aid would flow to Afghan Mujahideen fighting Soviet occupation.

Huq was also exporting huge quantities of heroin now being manufactured within his jurisdiction. Much of the profits from Huq's drug dealing ended up in the vaults of BCCI. Time magazine reporters Jonathan Beaty and S C Gwynne, in their book, *The Outlaw Bank*, note that with the collapse of world oil markets in the late 1970s, Abedi turned to drug money to shore up his ailing bank. "Abedi benefited from the backing of Fazle Huq", they write.

Employees of BCCI's infamous Black Network would unload arms for Afghanistan from ships arriving in Karachi onto trucks controlled by Pakistan's Inter Services Intelligence (ISI) Directorate. On the return trip from Peshawar, the trucks, which police were forbidden from searching, frequently carried heroin.

In the fall of 1991, Huq was murdered in Peshawar. Initially, local police said they were close to making arrests in what was thought to be a vengeance killing for Huq's alleged murder of a Shiite cleric. But the case remains unsolved and all but forgotten.

His coffers replenished with heroin money, Abedi, in 1981, offered Ishaq Khan the chairmanship of the BCC Foundation, a charitable institution sponsored by the bank, which until 1989, received all profits from BCCI's Pakistani operations. Ishaq Khan, now minister of finance and apparently oblivious to any conflict of interest, granted Abedi's bank tax-free status ensuring a steady flow of funds to the foundation he chaired. BCC did do some genuine charitable work but in reality it was little more than a convenient tax dodge often taking in far more than it disbursed.

The primary recipient of BCC largesse was the Ghulam Ishaq Khan Institute of Engineering Sciences and Technology. In 1987 alone, the foundation gave Ishaq Khan's namesake \$10 million enabling the institute to complete Pakistan's first nuclear warhead the same year.

Spurred by arch-rival India's detonation of a nuclear device in 1974, it was Bhutto, the man Ishaq Khan had helped send to the gallows, who decided that Pakistan would be the first to have the so-called Islamic bomb. But it was Ishaq Khan, Pakistan's political survivor *par excellence*, who saw it through to completion. His strident advocacy of a nuclear-armed Pakistan is well known. He once told acting CIA director Robert Gates that there was no question that Pakistan would use nuclear weapons in the event of another war with India, a threat reiterated only two months ago by former army chief of staff Mirza Aslam Beg.

Just how close the subcontinental rivals came to an actual nuclear exchange, in May 1990, has been chillingly revealed by veteran investigative reporter Seymour Hersh in a New Yorker story of March 29, 1996. It is readily evident from Hersh's account that Ishaq Khan and Aslam Beg were the paramount personalities in the nuclear showdown. But there were obstacles before they could get their hands on the nuclear trigger.

At 3.46 p.m. on August 17, 1988, a four-engined C-130 military transport took off from a desert airstrip near Bahawalpur in southern Punjab. Aboard were Zia ul-Haq, president of Pakistan, the top 10 generals in the Pakistani chain of command and US ambassador to Pakistan, Arnold L. Raphael.

At 3.51 p.m. villagers nine miles from Bahawalpur reported seeing the plane make three erratic mid-air loops before plunging to the desert floor and exploding in a ball of flame. All 31 aboard were killed.

Despite four separate investigations, the reason for the crash remains unexplained to this day. The conventional wisdom is that the tragedy was a sophisticated act of technical sabotage. Traces of phosphorous antimony and sulfur, for instance, were found in the wreckage. Most likely, the explosives were smuggled aboard in 20 uninspected crates of mangoes just before take-off.

At first, it was thought that the crash was the work of a 'foreign hand' – the CIA, KGB or India's Research and Analysis Wing. But as American journalist Edward Jay concluded, "only powerful elements inside Pakistan had the means to orchestrate what happened before and after the crash". Military personnel at Bahawalpur were suddenly transferred. Records of Zia's calls and intelligence files disappeared and no autopsies were performed on the plane's pilots. Within weeks, all mention of Zia and the crash had vanished from the local media. Who stood to profit from Zia's death?

Immediately before take-off, Aslam Beg informed Zia that a last minute appointment would prevent him from travelling on Pak One as planned. After Zia's plane plowed into the ground and exploded, the Cessna turbo-prop carrying Aslam Beg flew directly over the crash site without even circling to look for survivors. Arriving in Islamabad, Aslam Beg met at once with Ishaq Khan, now chairman of the senate, but due for an automatic promotion.

Three years earlier, Zia had amended the constitution to allow the chairman of the senate to replace him as president in the event of his death. Pakistan's charter also gave the president the power to appoint the army's chief of staff. Aslam Beg, who *Financial Times* correspondent Christina Lamb has written was 'scarcely known' before Zia's death, now became Ishaq Khan's right-hand man.

Last September, a judicial commission began yet another investigation into the crash. The Pakistani press has identified four high-ranking army officers amongst the conspirators. It is widely believed that Aslam Beg was another. So far, the shadow of public suspicion has not fallen on Ishaq Khan. But one of Zia's sons, Ejaz ul-Haq, who in December 1988 launched a multi-million dollar lawsuit to identify his father's killers, was not so easily mollified. "The Americans, the army and the president of Pakistan are all involved", he said.

Though Hersh's story touches on Zia's murder only in passing, a motive is inadvertently suggested. Zia, it was felt, was far too responsive to American pressure for Pakistan's good and would likely acquiesce if asked to pull in Pakistan's nuclear horns.

Ishaq Khan and the new army chief shared both a hostility to the US and a belief that Pakistan should strengthen ties with Pakistan's natural allies in the Islamic world. Writes Hersh, "[Aslam] Beg and president [Ishaq] Khan emerged from the...Zia crash with firm control over the Pakistani nuclear project and they maintained their control even after the general elections in November of 1988".

With Zia dead and buried, Pakistan's president played the democrat, refusing to postpone the elections that would bring Benazir Bhutto to power. But it was known that Bhutto and her Pakistan People's Party (PPP) commanded only limited support and even if she won, it was expected that Nawaz Sharif's control of Punjab, Pakistan's most populous province, would provide a counterweight to her governing effectively. As if to let her know at whose sufferance she ruled, Ishaq Khan waited a full 15 days before agreeing to swear in the new prime minister. Before he did so, he made Bhutto agree to offer no opposition to his role as president which was eventually confirmed by a vote in the senate, national assembly and the four provincial legislatures in December 1988.

The western media may have been head over heels with the Islamic world's first female prime minister but she proved a woefully ineffectual politician. Little significant legislation was passed during her tenure. As expected, the bureaucracy under Ishaq Khan's direction was largely left to run the country as it always had. Bhutto was also easily kept ignorant of the real status of Pakistan's nuclear programme.

The president seemed to go out of his way to be unco-operative. Relations were so frosty that not a word passed between Ishaq Khan and the prime minister for at least a year. Bureaucrats misdirected phone calls and misplaced files. Complained Bhutto at one point, "I'm in office but not in power". But the inefficiency and corruption which Ishaq Khan cited as reasons for giving Bhutto a prime ministerial pink slip, in August 1990, were nothing but pretexts.

In January 1989, for instance, Bhutto had met with US ambassador Robert Oakely who told her that BCCI was under investigation for criminal activity in the US. Oakely asked Bhutto to rescind the bank's Pakistani operating licence. She agreed in principle but immediately ran into strong opposition from a number of generals and high-level bureaucrats known to be on the BCCI payroll.

Bhutto also launched a concerted attack on Pakistan's heroin traffickers. It proved to be her undoing. By 1989, the drug trade was worth an estimated \$10 billion to Pakistan's wobbly economy. It had become too lucrative to too many to shut down. A drug trafficker interviewed by Lamb recalled, "when Benazir became prime minister, she launched a big campaign against the drug barons. We had

an emergency meeting and sent out warnings. A business associate of the PM's husband was abducted and several narcotics officers killed – the usual things. One of our number gave himself up and for awhile we were worried that he might name names, but the appropriate threats went out and he was released through lack of evidence. Laughable really...”

Indeed, the case against Lahore cinema owner Mirza Iqbal Baig had collapsed by October 1989. Likewise a seemingly iron-clad case against 53-year-old paper mill-owner Malik Mohammed Salim also went nowhere, even though lower courts had found enough evidence to warrant his extradition to the US. Then, just days before its dismissal, Bhutto's government announced that major names in the heroin business, some rumoured to be those of prominent and supposedly respectable citizens, would be named.

It's commonly thought that the army forced Ishaq Khan to remove Bhutto for her meddling in military appointments. But the army's animus against Bhutto is easy enough to understand for other reasons. As Selig Harrison, Senior Fellow with the Carnegie Endowment for International Peace, told the *Washington Post*, “You have about 10 Noriegas... very high up in the military... and it's very difficult to name names”.

An informant of Beaty and Gwynne's relates that near the end of her tenure Bhutto “was cancelling trips abroad because she feared that the drug mafia and her political opposition would get the army to declare martial law”. In August 1990, Begum Nusrat Bhutto, Benazir's mother, was unequivocal about her daughter's fall from power. “Heroin money was the issue behind the dismissal”, she said.

In elections the following October, two known heroin dealers were elected to Pakistan's national assembly both as members of new prime minister Nawaz Sharif's Islamic Democratic Alliance. Today there are thought to be at least 40 heroin syndicates in Pakistan, most with well established links to Europe and North America, and they continue to operate with virtual impunity. The questions also refuse to go away.

Was the president of Pakistan paid by heroin dealers to dump Bhutto? Was it just coincidence that Ishaq Khan is a Pathan and that the manufacture and distribution of Pakistani heroin is controlled by Pathans? Why has virtually nothing been done to stop the growth, in just 10 years, of an addict population in Pakistan of 1.7 million?

Last March, Indian police announced that a wave of bomb attacks that left 317 dead in Mumbai had been financed by Pakistani drug rings. Local mobsters, the Memon family and Dubai-based Indian gangster Dawood Ibrahim, reportedly received the 240 kilograms of RDX and Semtex explosives used in the bombings from Pakistan's ISI.

Said a senior police official, “we know that Dawood had reached an agreement with the Pakistani syndicates about three months ago”. At last report, Ibrahim was in Karachi.

Even with Bhutto sidelined to the opposition, Pakistan's president continued his vendetta against her. Special tribunals were set up to try members of the Bhutto government and Benazir's husband, Asif Ali Zardari, was arrested on trumped up charges, eventually thrown out of court. After the vote which brought Nawaz Sharif to power, Bhutto accused the president of rigging the election.

In November 1991, Ishaq Khan's son-in-law Irfanullah Marwat was charged in the brutal gang rape of Farhana Hayat, one of Bhutto's closest friends. Marwat, home affairs advisor to Jam Sadiq Ali chief minister of the volatile southern province of Sind, was acquitted. Hayat's family accused Ishaq Khan of a cover-up. In the fall of 1991, Sadiq Ali, a man whom the *Far Eastern Economic Review* reported “acts only under the president's orders” had 2,000 activists of Bhutto's PPP thrown in jail outraging international human rights organisations.

Sind's chief minister was also a close associate of Aga Hassan Abedi. The bogus banker provided Sadiq Ali with a rented house and a £5,000 monthly allowance on a visit to London. In 1988, Pakistan exerted diplomatic pressure on the US state department to curtail senate hearings into BCCI's criminal activities. Last year, when the US formally requested Abedi's extradition from Pakistan, Sadiq Ali vowed he would never permit it. Not long after Sadiq Ali died from cancer, but Abedi's extradition was still not forthcoming.

After two heart attacks and a transplant operation, the man who bilked billions spends his time in a 4,000 square foot walled compound in Karachi's Defence Officer's Society – home to Pakistan's military and political aristocracy. Sani Ahmed, former head of BCCI's protocol department is reportedly working with Abedi and has been granted a licence to open a new Pakistani bank.

Pakistan's new prime minister, Nawaz Sharif, also had reasons to protect the fugitive financier. In the early 1970s, the Sharif family's holdings had been confiscated by Zulfikar Ali Bhutto. Abedi then loaned the Sharif family money to start a steel plant in Dubai and, when it became unprofitable, he found a buyer and wrote off a \$2 million loan. Today the Sharif family's Ittefaq group is one of the most profitable business conglomerates in the country. In August 1991, the *New York Times* reported that advisors close to Nawaz Sharif were urging the prime minister to limit co-operation with the US investigation into BCCI so as not to offend the military.

At first, Ishaq Khan and Sharif got along well but rumours were soon circulating that the prime minister wouldn't last a full five-

year term. Last February, the prime minister set up a committee to review a constitutional provision granting the president power to dismiss democratically elected governments. There were other points of contention.

Sharif insisted on appointing Lieutenant General Javed Nasir as head of ISI against Ishaq Khan's wishes. Similar disagreements arose over the selection of army chief Abdul Waheed. Finally on April 18, Ishaq Khan dismissed Sharif's government just as he had that of Benazir Bhutto's three years earlier. In May, however the Supreme Court reinstated Sharif. A power struggle ensued for control of the provincial assemblies which eventually turned into a stallmate. In July, army chief Waheed then brokered an agreement between the president and prime minister who both agreed to resign. At the time, Sharif spoke cryptically of the “secrets of his heart” which would make “the people kill the tyrants if revealed”.

But there are far more ominous portents emanating from Pakistan these days. In September 1991, Ishaq Khan had travelled to Tehran. He called for closer co-operation between Iran and Pakistan and advocated the creation of an Islamic confederacy. Last summer, Iranian president Hashemi Rafshanjani flew to Islamabad where he expressed full support for Pakistan in its ongoing dispute with India over Kashmir.

Soon after the bombing of New York's World Trade Centre, two suspects, Mahmud Aboulahima and Ramzi Ahmed Yousef, reportedly fled to Pakistan. Yousef is still at large with a \$2 million state department reward on his head. But when Aboulahima was arrested in Egypt last month, he confessed that the terrorist had met with Iranian Intelligence officials in Peshawar before carrying out the bombing. Another suspect in the case, 37-year-old Matarawy Mohammad Said Saleh was convicted in the US for heroin trafficking, though no link between the bombing and drug money has been established. In June 1990, however, reports surfaced that Islamic fundamentalist and Afghan prime minister Gulbuddin Hekmatyar was operating an opium refinery near the Pakistan-Iran border. Hekmatyar then offered sanctuary to Sheikh Omar Abdel Rahman the alleged mastermind behind the World Trade Centre bombing. Is it just coincidence that Peshawar is a transit point for both heroin and Islamic fundamentalists travelling to and from Afghanistan?

The Official Discourse Around PITA

Gopika Solanki
Gitanjali Gangoli

Official discourse on prostitution – legislative and legal debates and judicial attitudes – reveals a disturbing ambivalence towards the practitioners and the profession. Not surprisingly, laws on prostitution are formulated to neither give justice to prostitutes nor eradicate prostitution. Moreover, the ambivalence often results in the prostitutes, already oppressed and abused at various levels of society, being further subjected to demeaning treatment at the hands of the state apparatus.

THE issue of prostitution has been constructed in a rigid and limited manner in the official discourse around it. Here we have in mind some of the legislative debates in the Lok Sabha, judicial interpretation of the laws on prostitution, and the attitudes of the police in implementing these laws. We are looking at these three aspects not only as an academic exercise, but because of the relevance they have to the lives of prostituted women. Prostitutes, as marginalised and vulnerable sections of society, are in frequent contact with the police and the judiciary. The attitudes and biases of the enforcement agencies have a profound impact on the ways in which the prostituted women carry on their professions, and the way in which they view themselves and their profession.

It is our contention that the laws on prostitution are neither formulated to give justice to practitioners, nor do they attempt to eradicate prostitution. They are only about penalising and controlling it. The law explores the boundary between private, moral conduct and public order and decency. Hence, the act of prostitution is not a criminal offence, yet it is not sanctioned by the law either, reflecting an ambivalence.

The article is divided into three sections. The first deals with the legislation debates in 1986, when the Suppression of Immoral Traffic in Women and Girls Act, 1956, was amended to Immoral Traffic in Women and Girls (Prevention) Act, 1986 (PITA). The second examines judicial interpretations while the third analyses the operational aspects of the law through the police. Our study of the police is based in Mumbai, partly through interviews conducted in the Nagpada police station, chosen due to its proximity to the 'red light' area and through our experiences of working with prostituted women and the police.

LEGISLATIVE DEBATES: THE 1986 AMENDMENT

The Indian legal system follows a particularly hypocritical attitude towards

prostitution. On the one hand, it does not prohibit or abolish prostitution. Instead, it is targeted at trafficking and soliciting. Until 1986, the law governing prostitution was called Suppression of Immoral Traffic in Women and Girls Act, 1956, popularly known as SITA. In August 1986, there was a move to amend it so as to change the focus of the act from 'suppression' to 'prevention'. A critical survey of the legislative debates reveal a number of interesting insights into the official discourse on the issue of prostitution and attitudes towards prostitutes.

SITA was sought to be amended for various reasons. The most significant among them being that it was not working, as this excerpt from a minister's speech introducing the bill brings out:

A number of individuals, advocacy groups and women's and voluntary organisations working for women, have been urging upon the government to enlarge the scope of the act, to make penal provisions more stringent, and to provide for certain minimum standards for correctional treatment and rehabilitation of the victims. In view of this, and the several gaps and lacunae noticed in the conceptualisation of the act, and the growing commercialisation of the flesh trade in different parts of the world, the present amendments are being moved [Margaret Alva, Lok Sabha Debates, August 22, 1986:141].

The proposed changes aimed to widen the scope of the act to cover all persons, whether male or female who are exploited sexually for commercial purposes. Appointment of special police officers with powers over the entire country was recommended. If a house was found being used for prostitution, the tenant, lessee or occupant was to be held responsible. Provision of women police officers during a raid, or as a substitute, a woman member from a registered welfare organisation or institute as a substitute was suggested. A compulsory medical testing by a registered medical practitioner of persons recovered from the premises of a brothel was mentioned.

In spite of all these stringent measures, as in the earlier act, prostitution *per se* was not criminalised. It was the act of soliciting that was an offence. The client was left untouched as before.

During the course of the debates in the Lok Sabha, a number of legislators expressed their scepticism about the viability of these proposed changes.

...one has to wonder why after such a law has been on the statute book for such a long time and I think it was in 1956 that the law was first enacted and in 1978 some amendments came and even then the inadequacies are still there, the loopholes are there and they are so wide that really speaking, the law has been more or less ineffective till now...we would certainly expect that the present amendments will fill up the loopholes but whether they are doing so, that we still do not know because we are not sure as to why the act has been ineffective so far [Amal Datta, Lok Sabha Debates, August 22, 1996:150]

There is an ambivalence in the attitudes towards practitioners of prostitution. On the one hand, there is a degree of 'sympathy' which is expressed in being patronising towards prostitutes such as describing them as "some unfortunate girls (who) come out of the houses for bad behaviour of family members or any other reason" [Phulrenu Guha, *ibid.* 147-48]. Their experiences are sentimentalised. "Tears will roll down your eyes if you hear as to how they are subjected to exploitation" [G S Rajhans, *ibid.* 153].

On the other hand, the debates reveal another aspect – the women within prostitution are also projected as 'bad' women

Another feature of this Bill is that the nomenclature of the Bill which was very ridiculous has been changed. The Suppression of Immoral Traffic Act which was popularly known as SITA has been changed. I remember in courts of law so many hundreds of SITAs used to stand and we used to refer (to) them as Sita No 1, Sita No 2 and Sita No 3. It is very rightful that those names have been changed [Shantaram Naik, *ibid.* 157-58].

In spite of the sympathy for such women Naik expressed later in his speech, he displays a heartfelt relief that prostitutes are no longer called by the hallowed and respected name of Sita, the icon of Indian womanhood.

Reference to prostitutes in many cases contain a voyeuristic tinge and makes sweeping statements about their lives and attitudes.

The call-girl is a more anxious person than a prostitute. Unlike the latter, she practices prostitution in a clandestine manner, in a strenuous effort to appear respectable in society, which overtakes her. Like a prostitute, however, a call-girl has a more pronounced negative attitude towards family, parents and

authority, than girls leading a normal life [Mool Chand Daga, *ibid*:161].

During the course of the debates, some allusions are made to a mythicised past, where India is romanticised as a country where women are held in high esteem.

It is a part of our culture that sex related violence against women and children should be opposed and put down. Gandhi used to say that the people's blood should boil when they see a woman insulted or a child abused. But it does not happen any longer. This shows our cultural degradation [T Kalpana Devi, *ibid*:144].

Not much attention is focused on the ways in which 'rehabilitation' of prostitutes can take place, even though it forms a vital part of the amendment. A detailed allusion to this is by Margaret Alva, the minister responsible for the amendment. But her reference is indirect and descriptive, focusing on her experience in a village in Madhya Pradesh where through her efforts some minor girls were married. The village was known to be the source of supply for brothels.

I was there a few months ago, we were women staying in these villages and we had the marriages of 29 girls celebrated just a few months ago. There are such powerful forces who are prepared to fight any effort at rehabilitating these girls and trying to get them into other professions. Lands were given (*etc.*) to young men who married them, we gave jobs to some, loans to others to encourage them to marry these girls. [Alva, *ibid* 173-74]

What emerges from this account is that marriage is seen as the only respectable option for potential and real prostitutes, even if they are minors. Granting loans to minor girls for their education and economic independence by the government could have been another effective measure. But for the powerful state machinery, minor girls are either potential wives or potential prostitutes.

These legislative debates in many senses reveal the ambiguities in the official discourse about prostitutes. Significantly, in spite of including men and boys within the ambit of this law, there is little debate around them. What is focused is the female prostitute, whether as a minor or an adult. The tokenist inclusion of men, to tilt the balance, is quickly forgotten as soon as it is brought in.

PERCEPTIONS OF JUDICIARY

Judicial attitudes towards prostitutes are no doubt worthy of study, but it may be interesting to begin by looking at the reverse, i.e. the attitude of prostitutes. According to a study conducted by the Central Social Welfare Board, prostitutes viewed representatives of the judiciary as being apathetic to their plight. "They do not consider us as human beings... They add to our harassment and humiliation... They fail to understand the human aspects of the problem. They perceive it as (a) law and order

problem'" are some of their remarks (quoted in *Prostitution in Metropolitan Cities of India*, a study by Central Social Welfare Board, New Delhi; 1996:86-87).

These attitudes are not unjustifiable. A closer look at some judgments on prostitution since the 1960s reveal that judges have displayed attitudes ranging from pity to contempt. In a recent judgment on child prostitution, judge Ratnavel Pandian refers to children within prostitution as both 'unfortunate' and as 'girls in full bloom'. The language used is prurient and voyeuristic, even as it seeks to convey sympathy for the minor girls (In the Supreme Court of India, Criminal Original Jurisdiction Writ Petition (Criminal) No 421 of 1989:2). A moral tenor is apparent, as brothels are referred to as "abodes of ill fame". Speaking of the Immoral Traffic (Prevention) Act, 1986, he states that this act aims to 'rescue the fallen women and girls and to stamp out the evils of prostitution and also to provide an opportunity to these fallen victims so that they could become decent members of society' (*ibid*:7). The locus is on the "violation of all canons of morality, decency and dignity of humankind", and prostitution is seen as "perpetuating and contributing to all kinds of unthinkable vulgarity" (*ibid*: 3, 4). Nowhere in the judgment is there any reference made to the physical and mental violence experienced by the minor girl.

Besides, there have been cases of misuse of powers by the judges. During a case in 1990 in Bombay, a magistrate summoned a lawyer fighting a bail case for a prostitute and asked him to send one of the women to him (based on Jean D'Cunha in the Report of 'The National Consultation on Child Prostitution' held in Bombay, December 1-3, 1994:20).

However, some of the earlier judgments under the SITA show a degree of sensitivity to the issue of prostitution. In one case, Gurudev Kaur was detained in a protective home as her family members (brothers and husband) alleged that she was a prostitute. Gurudev Kaur in her statement held that she wanted to live alone. She feared for her life at the hands of her brother. Justice H R Khanna of the Punjab High Court directed that since Gurudev Kaur was a major and had not applied for admission in a protective home, under S 19(1) SITA, she could not be detained against her wishes in the protective home. He held that an order under S 19(1) could not be made only on an application made by the concerned (AIR 1963, Punjab 369 V50 C101).

Another laudable judgment was passed in 1962. In this case, the police employed a decoy in the guise of a customer, who went to a brothel in Madras and had sexual intercourse with a prostitute. The rest of the police team and two witnesses barged into the room and arrested the prostitute, the pimps and the brothel keeper. All this in

order to prove that the woman was a prostitute and the house, a brothel. The judge condemned this method of investigation by the police, stating, "In my mind, nothing can be reprehensible than the conduct of this investigation... Such investigation will not have any salubrious effect upon the public mind and will not achieve the objective for which the act was passed" (AIR 1962 Madras 31 V49 C6).

The judge held that the action of the police barging into the bedroom, without even a knock, was tantamount to outraging the modesty of a woman under S509 IPC and stated, "I must reiterate that the modesty of a prostitute is entitled to equal protection with that of any other woman". He felt that the manner of conducting the raid should be changed and revolutionised to prevent the abuse of power by the police (*ibid*:35).

Justice Anantanarayanan acquitted the prostituted woman, by holding that "the purpose of SITA is to inhibit or abolish the commercialised vice, namely, the traffic in women and girls for purpose of prostitution as an organised means of living. The idea was not to render prostitution *per se* a criminal offence or to punish a woman merely because she prostitutes herself" (*ibid*:33).

PERCEPTIONS OF THE POLICE: PITA AND PROSTITUTION

The culturally sanctioned and dichotomous views of prostituted women and their role are embodied in political institutions, as seen in the cases of the legislative body as well as the judiciary. The police as an implementing agency continue to mirror and perpetuate these processes. The interviews with the police revealed conceptual, structural, attitudinal as well as operational ambivalence of the police system regarding the issue of prostitution.

Majority of the police personnel interviewed perceived prostitution as a 'social evil' that was also necessary for a 'healthy society' "We need prostitutes so that women like you can walk safely on the streets. Actually, we say that prostitutes are social workers" (Ajit Wagh, senior police inspector, Nagpada police station). The logic behind the assumption being that since men's uncontrollable sexual urges would be channelised through prostitutes, 'other' women will be able to lead lives free of sexual violence from men. This categorisation of the 'bad' woman, the prostitute and the 'good' woman, the respectable wife, mother and daughter binds women rigidly to their various roles and disallows any role transgression.

Besides, dual morality inherent in the act creeps into the implementation by the police as well, "while the act does not ban prostitution, it makes it difficult for women to practice. A woman cannot practice prostitution within 100 metres of public place.

In a congested city like Mumbai, it would be impossible for any woman to practice flesh trade" (senior police inspector, Nagpada police station, commenting on PITA).

As there is no precise definition of a "prostitute" in the act, any lone woman walking on the streets can be termed as such. "The police need a search warrant to search a brothel. No such legality is necessary to hook a sole woman out there 'soliciting'" (police inspector, crime, Nagpada police station). The term 'soliciting' is also vague and can be used to penalise any woman at home too. The police admit that sitting at a window or standing in the balcony and gesturing peculiarly can also be technically interpreted as 'soliciting'.

While most of the police personnel admit that women enter the profession because of poverty, some do it also for fun, especially the call-girls, who have an element of choice. Like the judiciary, the attitude of the police expresses pity coupled with speculations of wild sexuality of the prostitute.

According to the police the difference between SITA and PITA at the implementation level lies merely in the name. At the level of the police station, nothing has changed. Two senior police officers remembered the amendment vaguely, while others were not aware of the fact that PITA was an amendment of SITA.

Not surprisingly, one of the criticisms levelled against the police is that the police are not conversant with the act and therefore do not charge the criminals under appropriate sections. On being asked, "Under which section will you charge a pimp?", a police officer at Nagpada police station replied, "Under PITA, of course". "And if he has raped a woman/innor girl?" "Madam, it all comes under PITA anyway, but if the girl states that she has been raped explicitly in her FIR, then we may include the charge under S 375, IPC".

It is observed that the police can be notoriously insensitive while filing an FIR and girl or a woman may not be willing to talk about her experiences of violence to them. Besides, women have been forced to sign on FIRs by the police even when they have not been faithful to the women's version of the events.

The police seemed to view their job as one where they nab the criminals and bring them to justice. This narrow perception of their work leads to indifference and apathetic attitudes towards the victims. For instance, there is excessive importance given at the police station level to conduct raids to rescue women and girls, and to catch the brothel-keepers and the pimps. A police officer who did not know PITA well, gave a vivid description of how the police employ a decoy, who poses as a client and then the rest of the team moves in to arrest the prostitutes, the brothel-keeper and the pimps, and rescue

the minors. The manner in which these raids are conducted shows that the police are oblivious to the needs of the victims. This was glaringly evident in the raids conducted by Mumbai police in response to the Bombay High Court order to rescue minor girls forced into prostitution earlier this year. The verbal reports of social workers from Mumbai-based organisations like Prerna, Prayas, Mahila Dakshata Samiti, to the National Commission for Women point out, "though the high court order was to rescue minor girls, the police rounded up adult women as well. Women were not even allowed to take their children. They were not allowed to pack their belongings either, with was a financial blow to many of them who had managed to save and hide some savings for a rainy day." Not only that, even in custody, there was an instance where these women were beaten up by the police in St Joseph's Home, one of the institutions where they were housed. The other reported incidences of some male police officers sexually harassing these women with leering looks and sexually suggestive derogatory comments. One of the police personnel from Nagpada had even suggested to the pimps to "take out a demonstration of prostitutes if they wanted their girls to be released" (personal communication from activists of 'Prayas').

The social aspect of policing is also conspicuously absent in the police work. The police perceives reality in black and white terms, leading to negligence of other tasks. For instance, it is the duty of the police to refer the 'rescued' women to appropriate shelters. However, most police officers were unclear about the differences between reception centres and shelter homes for rehabilitation. In a police raid in 1992, a minor girl was sent to the reception centre for elderly women at Deonar, instead of the Juvenile home at Dongri. The 13-year girl was traumatised since it led to certain procedural problems of the shelter authorities not being able to give consent for abortion. Emotionally, too, she remained insecure among the older women. Technically, this problem should have cropped up as all the police stations have a directory along with the names, telephone numbers and addresses of the social organisations. However, the directory is rarely used, due to complete disregard for the social aspect of policing which calls for caring the victims and referring them to suitable organisations.

The police personnel reply at length on the difficulties to prosecute the prostitutes, brothel-keepers and the pimps. According to them, prostitutes who get caught are bailed out by the pimps and then have to repay them by increasing their labours once they are back into the same circuit. At other times, some women or girls who are rescued and sent home, refuse to come again to give evidence as witnesses because of long

distances or fear of being exposed in a community they currently reside in or being engaged in other activities back home. Often they keep on shifting and hence are difficult to track down. The police as a result get demoralised and resist to register cases under PITA. The police are indoctrinated that it is their duty to catch the wrongdoers and develop a strong sense of justice. But they often get disillusioned when their hard work does not yield results, and the accused gets away scot-free.

The method of implementation of the law on prostitution needs to be problematised. The emphasis of policing, traditionally defined as prevention of crime and maintenance of law and order, needs to be broadened to include social aspects of policing. The police training needs to be periodical and decentralised to avoid excuses such as "I am new to the police station and therefore not familiar with area, specific issues and modes of intervention". Moreover, police training module should include wider social questions about the effects of caste, religion, class and gender issues, and how the power relations embedded in them can be changed.

There are several commonalities in the official discourse. Prostitutes are seen as victims and viewed through a prism combining sentimentality and pity. At other times, the official gaze contains a strong tinge of voyeurism. In the legal rhetoric, the prostituted women are considered as offenders. While the law on prostitution does not prohibit the act of prostitution, by criminalising soliciting, it renders prostitution almost impossible to practise without the interference of the state. In this way, the inherent moral agenda of the state is fulfilled.

Though the prostitutes are oppressed at multiple levels – by pimps and brothel-keepers, clients, families and the state machinery – decriminalising prostitution is the only way to prevent their oppression at the hands of the police and the judiciary. At the same time, stringent measures have to be taken to stop coercion and child prostitution, in which the victim is not penalised. Besides, the entire concept of rehabilitation of those peripheral in the society needs to be properly worked out. Patronising attitudes, lack of trained and sensitive personnel, lack of monetary and infrastructural resources render rehabilitation counter-productive.

However, decriminalising prostitution can serve at best as a short-term and immediate response to the issue. So long as women and their bodies are seen as sites of control and consumption, and divisions are made between 'good' and 'bad' women, prostitution will continue and choices denied to women.

[The authors express their gratitude to advocates Maharukh Adenwalla and Colin Gonsalves for their generosity in providing their time, advice and data.]

Towards a Doctrinal Synthesis

U Kalpagam

Property and Prices: Towards a Unified Theory of Value by Andre Burgstaller; Cambridge University Press, Cambridge, 1994.

IT is very rarely that one comes across a technical book in economics that is so fascinating and captivating as the one under review. As its subtitle indicates, it is a grand project; and so is the conception and execution of the book within the format of stylised growth theory. The book attempts to show that classical and neo-classical value theories have a symmetrical mathematical structure once the stock market is introduced. Thus it tries to reconcile the two great rivals in value theory while at the same time it integrates finance theory with capital theory.

Treating asset arbitrage as the most foundational aspect of behaviour in systems in which property rights are alienable, as it remains invariant with all other optimising strategies, a stock-equilibrium condition is introduced to the usual flow-equilibrium analysis. The requirement of stock equilibrium or the arbitrage equation is that the owners of the economy's real resources are at all times satisfied with the composition of their portfolios, a condition that is ensured when expected rates of return on equities are uniform at all times. The author views the arbitrage mechanism as more fundamental than the classical principle of uniform long-run rate of profit or the neo-classical principle of utility maximisation and flow-market clearing. Despite the growing importance of financial capital in modern times, the author points out that it never acquired analytical status within economic theory, being largely consigned to the periphery of policy-oriented disciplines. I would have been glad if the author had at least foot-noted for the reader the manner in which the analytical status of the older models of 'Money in Growth models' that appear even in textbooks on growth theory such as Henry Wan Jr differ from his approach; this, need it be said, is only a very minor caveat.

The author does convincingly pose the question of what would happen in the classical Ricardian model if profit rates were equalised not merely across sectoral productive activities but across all forms of holding wealth as well. While Ricardo's failure to pose this question should not be surprising, the author is perplexed why general equilibrium theorists have not done either. Although Walras did introduce the stock market in his *Elements of Pure Economics*, the author finds the treatment muddled with

the attempt to conflate the stock market with the loanable-funds market, in order to retain the flow-equilibrium perspective. At least in value theory the author notes, the stock-equilibrium perspective did not gain acceptance, although the macro-economics of Keynes did ultimately introduce it, with far-reaching significance in areas such as the theory of flexible exchange rates.

By introducing the distinction between immobile material resources and the highly mobile ownership claims on them, the author postulates a quasi-Hamiltonian system of the form given below:

$$\begin{aligned}x &= \psi(\pi, x; a) & x &= \psi(\pi, x, a) \\ \pi &= \phi(\pi, x, a) & \pi &= \phi(\pi, x; a)\end{aligned}$$

where x is a vector of input allocations by sector, π a vector of prices of ownership claims, and "a" a vector of shift parameters. By making the assumption that existing resource stocks are immobile between alternative employments but ownership claims can be instantaneously and costlessly traded in a competitive market, the system's dynamic is propelled by the arbitrage equation. While the analysis omits the role of uncertainty, the author argues convincingly as to why under conditions of certainty, ownership claims are not reducible to the physical resources themselves. In line with the recent developments in value theory, the author believes that the problem of value has a recursive logical structure of three steps: asset arbitrage, optimisation and equilibrium.

Making the claim that this Hamiltonian system has enabled him to find the common theoretical core of classical and Walrasian economics, the author argues that his approach frees it from the criticisms launched against the Neo-Ricardian approach to classical theory inspired by Sraffa, in that their being confined to steady states are non-causal in nature and not anchored in arbitrary initial conditions, unlike the Walrasian system with their emphasis on given initial resource endowments and the sequence of non-steady state temporary equilibria. Similarly the non-substitution theorem that under certain conditions the relative prices are independent of the structure of demand, and the Ricardo-Bortkiewicz-Sraffa theorem that only technical changes in the production of basics affect the economy's rate of profit which figure in the Marxian and Neo-Ricardian

approaches but not the Walrasian ones, makes sense in his Hamiltonian system. It needs however to be noted that author's use of basics and non-basics is different from Sraffa's. Whereas in Sraffa a basic is a produced commodity that enters directly or indirectly into the production of all commodities, and non-basics are those produced commodities that are not basic, for the present author non-basics are outputs that cannot be stored and hence non-accountable as input stocks. This approach has been necessitated to obtain the vector of fundamental asset prices needed for his Hamiltonian system.

His approach also enables the author to reopen the Cambridge controversies in a novel way. The author believes that the Arrow-Debreu model while highlighting utility maximisation and flow-market clearing removes to the shadows the 'competition of capitals' and the principle of uniform rate of profit, which are nonetheless analytically present though descriptively only implicit. He shows this by translating a simplified version of the Arrow-Debreu model into a classical arbitrage-based von Neumann economy.

The author's general line of attack at doctrinal synthesis between the Walras-Fisher-Hicks-Arrow-Debreu tradition and the Ricardo-Marx-von Neumann-Sraffa tradition is to build a sequence of models with different assumptions about input reproducibility and output durability. The book is divided into two sections, the first set of models dealing with reproducible resources and the other, of models dealing with primary resources; all the models incidentally bears the names of figures most closely associated with it. Also the models have four sets of atomistic agents driving the system to temporary equilibrium and intertemporally optimal paths. These are the capitalists making the usual consumption, saving and capital accumulation decisions to arrive at flow-equilibrium via utility maximising exercises; the entrepreneurs ensuring that entrepreneurial profits are competitively driven to zero at each instant; the speculators possessing myopic and perfect foresight espouse their expectations to the other agents and thus always set the economy onto saddle-path stability; and the arbitrageurs playing the most crucial role in this approach of ensuring stock equilibrium by ensuring that clients' portfolios are efficient at all times, thus the stock market price is instantaneously moved to its temporary equilibrium price.

For purposes of clarity, I provide the assumptions of each model starting from the models in the section on "Reproducible resources". Von Neumann I contains only

basics as both inputs and outputs and is a pure stock-equilibrium two-sector, non-steady state, continuous-time version of the von Neumann 1946 economy. The production functions in this model are of the form of "specific-factors, single-technique Leontief technology" exhibiting a simple form of the Uzawa factor-intensity assumption. Von Neumann II and III relax the basic-only assumption of the earlier model and treats output as perishable instantaneously. Whereas in the earlier model consumer preference plays no role in price determination, now with output as non-basics, the point-in-time equilibrium price could be determined by Walrasian flow equilibrium. Also since output cannot be stored, there is no role for speculative activity. The Ricardo-Bortkiewicz-Sraffa theorem that seems to be at odds with general-equilibrium thinking is proved to be valid. Von Neumann III is an endogenous specification of Von Neumann II as it introduces a technology that transforms non-basics to basics. The Marx-Sraffa model introduces labour as a resource reproducible endogenously within the system keeping in line with the classical perspective. The Hamiltonian system is then shown to demonstrate Marx's falling rate of profit and Sraffa's inverse relationship between wage share and profit rate. The chapter on Arrow-Debreu model shows how it is isomorphic with the author's Hamiltonian system. In its attempt to show that, the chapter provides very rich insights into the entire developments in capital theory.

The section on "Primary resources" deals with the following models. Ricardo is a two-sector model and introduces land as a primary non-reproducible resource, a basic good, i.e., the corn, and a non-basic Ricardian luxury. The model is shown to possess many properties, an interesting one being its similarity in structure with Pasinetti's two-sector Ricardian economy, although it differs from his through the incorporation of a stock market in land and is consistent with intertemporal consumption optimisation. The Ramsey-Solow-Uzawa model establishes its structural identity with the Ricardian model. It is the author's position that non-reproducible neo-classical labour mimics Ricardian land as an input. A corresponding stock market in labour is said to exist if ownership claims to human capital are alienable in the stock market in the absence of prohibitions against voluntary slavery. While the Ramsey-Solow model is one-sector, the Uzawa model is a two-sector adaptation of the earlier models of Uzawa and Srinivasan. Although neo-classical, the model obeys both the Ricardo-Bortkiewicz-Sraffa theorem as well as the Samuelson non-substitution theorem. When a Leontief technology is introduced, the Uzawa-Leontief structure, its dynamic features are similar to

the Ricardo-Leontief model. The doctrinal circle of production models is closed by including one or several non-reproducible inputs in the Von Neumann I model, called here Walras and Capital. Walras I has two basics and a single non-produced resource. The model obeys the Samuelson non-substitution theorem in the long run. The temporary movement of prices is for reasons other than the Walrasian market-clearing argument, namely, to stock market disequilibria. Walras II deals with multiple basics and multiple primary resources. Given the multiple long-run scarcities in the economy, a long-run equilibrium is possible only if the growth rates of the primary resources coincide. Also the non-substitution theorem is not valid. An interesting supplement convincingly argues a flaw in Walras's capital theory. In Walras and Exchange the author argues his case as to why the reasons generally adduced for assumptions of "perfect factor mobility" may not be valid. His stock market approach enables him to counter the usual arguments that resource transfers are intractable or representation in general equilibrium models. Walras III presents a model in which primary inputs are intersectorally moveable over time via an investment process. Its limiting cases

are perfect factor mobility and resource immovability. The latter case collapses into Walras IV which is the Walrasian model of pure exchange. It is the author's conviction that Walras's model of pure exchange in focusing exclusively on the terms at which agents are willing to trade endowments, fails to enquire into the conditions under which agents are willing to hold the ownership claims attached to the sources of these endowments. His stock market approach enables him to do that.

For all of these models, the author examines the temporary equilibrium and steady state properties. The models themselves are simple formulations, free of complexities such as variable rates of time preference, overlapping-generations structure, or non-linear specifications. Any reader with a knowledge of Hamiltonian dynamics, stability analysis and phase-diagram approach, an understanding of the logic of dynamic optimisation, an aptitude for the theoretical debates in economics with a specific liking for growth theory, and a fondness for the von Neumann classic paper will be able to read and appreciate this book. The extraordinary appeal of the book lies in the fact that technical virtuosity is subordinated to the larger philosophical endeavour.

Responses to Ozone Depletion

K Ravi Srinivas

Mending the Ozone Hole: Science, Technology and Policy by Arjun Makhijani and Kevin R Gurney; The MIT Press, Cambridge, USA, 1995; pp 356 + index, \$ 35 (hard cover).

THE stratosphere, which surrounds the earth at a height of 25 kms, is rich in ozone. Ozone prevents the reaching of sun's ultra violet rays (UV-B) to the earth. UV-B can adversely affect all life on earth, including marine life, plants, birds and of course humans. In 1974 Rowland and Molina put forward a hypothesis that chlorinated compounds could persist in the atmosphere long enough to reach the stratosphere and could result in destruction of ozone. This was proved by subsequent research, and the discovery of the Antarctic ozone hole in 1985 led the nations to come to an agreement on controlling chlorofluorocarbons (CFCs) and other ozone-destroying substance(s) (ODS). In 1987 the Montreal protocol on substances that deplete the ozone layer was signed. This protocol is perhaps the first international agreement which was widely accepted by almost all nations. As a result of the protocol, the consumption of CFCs, halons, methyl chloroforms and carbon tetrachloride had been dramatically reduced and the developing

nations have time till 2010 to end their consumption. Still not all ODSs have been phased out in industrialised nations. For example, methyl bromide continues to be produced and used. According to United Nations environment programme (UNEP), methyl bromide, a fumigant used to kill pests in soil, agricultural produce, etc., is responsible for about 5 to 10 per cent of world wide ozone depletion.

Authors of this book have attempted to provide an overview of the ozone layer depletion, its causes, the scientific understanding of the issue, the technological options and the policy issues. This book is written with an interested reader in mind and hence the authors have tried to explain various aspects, without intimidating the reader by resorting to technical jargon, as much as possible.

The first part deals with the mechanisms of ozone depletion, and health, environmental and epidemiological impacts of the depletion of ozone layer. They point out that there is

no need for complacency and delaying the phasing out of ODSs will only do more harm. They discuss the effects of ozone depletion on human health and point out that, Severe persistent declines in stratospheric ozone could seriously damage life on earth. For instance, disease epidemics could be triggered by a combination of decreased immunity, declining food production, and the direct disease-producing effects of UV-B radiation. These could be so serious as to greatly strain or even overwhelm the ability of economic and medical systems to respond, particularly in third world countries. As we have discussed, severe depletion could also disrupt ecological systems considerably, with unknown effects" (p 88).

In the eight chapters in the next part the authors provide a detailed description of various sources, uses and alternatives to ODSs. They examine the uses of ODSs before 1985, i.e., before they were subject to regulation. They point out that till 1988 at the international level the focus was mostly on regulating CFCs, and carbon tetrachloride was added in 1990. No explicit overall goal has been set in the guidelines to regulate ODSs.

The authors discuss the effectiveness and limitations of various policies for regulating the production and consumption of various ODSs. Since ODSs are used in diverse applications ranging from air-conditioning and refrigeration to use as solvents, foam products, the authors discuss the present state of the art, potential alternatives and the recommended phase out schedules for ODSs in various applications.

The regulations and policy framework, impact of various measures in the light of three scenarios, estimates by the authors and summary of findings and recommendations figure in part III. After critically examining the regulations and available technologies for phasing out ODSs the authors conclude that by and large regulations have played an effective role in development of alternative technologies. They advocate levying taxes on the use of ODSs in industrialised nations. In the next chapter they discuss the features and implications of the three scenarios (Copenhagen Amendments scenario, the Accelerated Phaseout scenario and the Save Our Skins scenario), and their assumptions. The Saving Our Skins scenario is considered by the authors as the most stringent technically feasible strategy to control ODSs.

They evaluate the response of the industry, particularly how the industry in USA responded to the issue of ozone layer depletion. The industry did abandon research and development of alternatives to CFCs although they were aware of the impact of CFCs on ozone layer. Until governments and citizens groups put pressure on them, for industry it was business as usual. According

to the authors, 'It seems clear that corporations did not internalise even minimally the social and economic costs of the harm done by their products, until governmental regulations and citizen pressure forced them to do so' (p 272). In contrast to the behaviour of the US companies, the corporate sector in Sweden collaborated with the government and as a result substantial progress in reduction in use of CFC was possible and development of alternatives was also given priority. But in the US due to weak regulatory regime, companies did not give importance to development of alternatives and much money was spent on conversion to HCFCs than to the development of alternatives to ozone depleting chemicals and technologies. Thus, the regulatory regime plays an important role in not only influencing corporate investment but also in making the industry aware of its responsibilities.

By writing a comprehensive volume that covers almost all the aspects of the depletion of ozone layer the authors have made enormous amount of data and incisive analysis available in a single volume. This will benefit readers who want to get a comprehensive overview of the problem, scientific explanations, technological alternatives and policies, but may have neither the time nor access to the vast literature on the subject.

The authors could have taken into account different schools of thought on the interaction between science, politics, knowledge and power in global environmental regulations and the implications of the same for policy and strategy. They could have put forth their views on such approaches to international environmental regulations. The science politics interface in ozone depletion issue has not been critically evaluated by the authors. Recent works have argued about the

role of science in international regime formations and how networks of knowledge-based communities play an important role, articulating the issues and relationships, frame issues for debate and set the agenda for policies and influence negotiations.¹ I wish that the authors could have provided more details about the evolution of international regulatory framework, particularly the North-South conflict.² The role of environmental groups and NGOs in international environmental issues and their role in the international environmental negotiations is widely acknowledged now. A chapter on their role, their strengths and limitations and role of grass roots groups in influencing corporate behaviour and governments regarding ozone layer depletion could have been added. This will be relevant as, for example it was the campaign by grass roots environmental groups that forced McDonald to get rid of styrofoam sandwich packing (interview with Lois Gibbs in *Multinational Monitor*, April 1996).

This volume is a valuable contribution to the literature on global environmental issues. It will be useful to NGOs, scholars and concerned citizens. One hopes that the publishers will bring out a cheaper paperback edition of this book.

Notes

Applications are invited for the following posts:

- | | | |
|--|---|----------|
| 1. Professor of Economics | – | One post |
| 2. Associate Professor of Economics | – | One post |
| 3. Publications Officer
(equivalent to Assistant Professor) | – | One post |
| 4. Computational Assistant
(reserved for SC/ST Candidates) | – | One post |

Essential Qualification:

- Post 1: a) Master's degree in the subject with 50% marks in the aggregate;
b) Ph.D or published work of equivalent standard in the subject;
c) 10 years teaching and/or research experience in the subject;
d) Publications in the subject.
- Post 2: a) Master's degree in Economics with minimum 50% marks in the aggregate;
b) Ph.D or published work of equivalent standard in the subject;
c) 5 years teaching and/or research experience in the subject;
d) Publications in the subject.
- Post 3: a) Master's degree in any of the Social Science subject, Diploma/Master's degree in journalism;
b) Minimum five years experience in the field of preparation of annual reports/editing of books/manuscripts, dealing with the publishers and other related works connected with the publications.
c) Knowledge of computer operation.
- Post 4: a) Bachelor's degree in Economics/Statistics/Mathematics with 50% marks in the aggregate;
b) Experience in the use of computers and knowledge with different software packages;

DESIRABLE QUALIFICATION:

Post 1: Research work of high quality in Public Economics/Industrial Economics.

Post 2: Experience in conducting research and specialization in Industrial Economics/ International Trade/Urban Economics/Public Economics.

Post 4: i) Familiarity with data from Census, sample surveys and official records on population;
ii) Candidates with Master's degree would be preferred;
iii) Knowledge of Kannada.

Note: Those who have applied for posts 1 and 2 in response to the earlier advertisement need not apply again.

Scale of Pay:

Post 1: Rs. 4500-150-5700-200-7300 (Gross salary at the minimum of the scale is Rs. 10711.00)

Post 2: Rs. 3700-125-4700-150-5700 (Gross salary at the minimum of the scale is Rs. 9897.00)

Post 3: Rs. 2200-75-2800-100-4000 (Gross salary at the minimum of the scale is Rs. 6240.00)

Post 4: Rs. 1280-30-1400-40-1800-50-2300-75-2375 (Gross salary at the minimum of the scale is Rs. 3482.00)

Age:

Normally below 50 years for post 1, 40 years for post 2, 35 years for post 3, and 30 years for post 4. Age relaxable up to 5 years in case of SC/ST candidates. No age limit in case of employees of the Institute.

The selection committee may relax qualification in exceptional cases and can also consider suitable candidates from outside the list of applicants. Higher start may be given in deserving cases according to rules.

Application forms and a copy of full advertisement can be had from the Registrar by sending a Bank draft for Rs.25/- for post 1, Rs.20/- for post 2, Rs.15/- for post 3. No application fee for the candidates belonging to Scheduled Caste and Scheduled Tribe. *Last date for receipt of completed application is 31st January 1997 for Post 1, 2 and 3, 15th January 1997 for post 4.*

Private Schooling in India

Size, Nature, and Equity-Effects

Geeta G Kingdon

Published educational statistics in India ignore 'unrecognised' private schools and include only the 'recognised' private schools, though all government-funded schools are included. Moreover, enrolments in government-funded schools are greatly over-reported in education data. This article argues that, as a result, official education statistics are seriously skewed: they exaggerate the size of the free, government-funded elementary school sector and greatly understate the size of the private fee-charging elementary school sector. While it may be expedient for the state to exaggerate its own contribution to school education, a system where fee-levying institutions have a significant role in elementary education while secondary education is largely state-supported has perverse equity-effects. The article also presents evidence to show that official enrolment statistics – on which analysts, policy-makers, and international studies rely, and which are used in parliamentary debates – are gravely inaccurate.

I Introduction

THE desirability or otherwise of private education has long been a subject of debate in India and the case of Mohini Jain [Sathe 1992] against a private capitation-fee college has renewed interest in the issue. Yet, the nature, size and equity-effects of private education are not well understood, and it is not known whether and to what extent this sector has expanded or shrunk over time at different levels of education.

At present there is no consensus on an estimate of the size of the private school sector in India. On the one hand, prominent education economists believe that the private fee-levying (i.e., the Private Unaided) school sector in India is 'infinitesimally' and 'negligibly' small [Tilak 1990:35, Govinda and Vaighese 1993:51]; on the other hand, government of India [GOI 1993:4] states "no doubt large numbers of private schools have been opened since independence" and that "there is an increasing incidence of the so-called English-medium [private] schools" [GOI 1985:53]. In this paper we explore which of the above two opposing views is correct and focus on the following questions: What do the official educational statistics tell us about the total size of the private schooling sector and about the relative size of elementary and secondary private schooling? How reliable are these statistics? Is the private education sector expanding and at what rate?

In much of the existing literature in India, private schools are characterised as elite, high-fee schools that cater only to the children of the rich in urban areas. This is not supported by primary survey evidence, which suggests economic and geographic heterogeneity in private schools. In this paper we probe this issue further and present some evidence that challenges the conventional portrayal of

Indian private schools as elitist and mostly urban. Knowledge of the nature and relative sizes of free and fee-charging schooling at different levels of education can shed light on how equitable the system of education is as a whole. For example, a system where (given public resource scarcity) the provision of primary education is predominantly government-funded and free – though some fee-charging provision exists in secondary and higher education – is likely, in principle, to be much more equitable than a system where fee-charging institutions have an important role in primary education and an insignificant one in secondary and higher education.

This paper examines evidence on the nature, size, and growth of fee-charging private education in India, with special reference to one state – Uttar Pradesh (UP). Given interstate variations in the structure and organisation of education in India,¹ evidence from a single state will be illustrative but not necessarily representative. However, where possible, we present evidence both for UP and for India as a whole, including occasionally for separate states. This enables us to observe the extent of interstate variation in the role of fee-charging schools. A particular focus of the paper is on the relative size of private schooling at the elementary and secondary education levels and on the implications of this for educational equity.

The following section defines the concepts and terminology to be used in the paper. Section III analyses the nature of private education in India and Section IV presents evidence on the size of the fee-charging sector in education in UP. Section V presents figures on the relative size of the private elementary and secondary education sectors. In Section VI we examine the equity consequences of the prevailing mix of fee-charging and free schools in elementary and

secondary education. The final section concludes.

II Definitions, Terminology

In UP, as in most states, primary education refers to classes 1-5, junior to classes 6 to 8, elementary (or basic) to classes 1-8, and secondary to classes 9-12. It is important to note the distinction between private aided (PA) and private unaided schools (PUA), even though in much of the educational debate in India the two are treated as a single category 'private'. PA schools are those which, though privately managed, are heavily regulated by the state government² and are almost entirely funded by the state: 95 per cent or more of PA schools' total expenses are paid by the state exchequer [Tilak 1990:34]. Being primarily government-funded, PA schools have become semi-government schools.³ Like government (G) schools, PA schools cannot recruit or dismiss their own staff; for example, in Uttar Pradesh, the UP Government Education Service Commission selects and appoints their staff. The state government pays the full salaries of all PA school staff at the same rates as for government school teachers. Importantly, PA schools, like G schools, cannot charge any tuition fees even in secondary classes.⁴ Thus, both G and PA schools are free schools and are state-supported.

By contrast, PUA schools operate autonomously and are entirely self-financed. They recruit, pay, and discipline their own staff and they do de facto charge tuition fees, though in UP, as perhaps in other states, they are supposed de jure not to. In vital ways, therefore, PA schools differ from PUA schools despite sharing the appellation 'private'.⁵ This paper is concerned with the size and growth of the PUA schools which are the truly 'private' schools. In the rest of this paper, PUA schools are referred to as

private or PUA schools while G and PA schools, which are the free schools, are referred to as GPA or free schools.

A further crucial distinction should be noted for the purposes of understanding the issues in this paper, namely, the difference between 'recognised' and 'unrecognised' PUA schools. State government recognition is an official stamp of approval but it requires certain conditions to be fulfilled.⁶ While all PUA secondary schools must be recognised, elementary schools do not have to be recognised in many states. Indeed, as Dhingra (1991) points out, in many states, elementary schools do not even have to be registered, let alone be government-recognised.

The main reason for wanting recognition is to become eligible to apply for government grant-in-aid and to be able to issue valid transfer certificates (TCs) to students leaving the school. However, few PUA schools want to apply for government grant-in-aid to become PA since it brings them under state regulation and removes the possibilities for private managers to charge fees and derive pecuniary benefit from their school.⁷ The TC of a recognised school is required in order for a child to gain admission to another school. In practice, however, valid TCs are not indispensable for admission to a junior school but appear to be needed for admission into secondary schools. Consequently, PUA primary schools do not have any important incentive to seek recognition but PUA junior schools do.

Given the stringent conditions for recognition as listed in footnote 6, it is likely that many applications for recognition are turned down. Dreze and Saran (1993:39) report that rural private schools found it difficult to obtain 'manyata' (recognition) in and around Palampur, UP. In any case, conditions such as that the private school seeking recognition should not be situated within a 5 km radius of an existing G school, preclude many PUA schools from even applying for government recognition. The fact that certain conditions are mutually impossible to fulfil (such as charging the government prescribed (nil) fees and paying teachers the high prescribed minimum salaries) would also serve as a discouragement to private school operators seeking recognition.⁸

In conclusion, given the onerous conditions of recognition and the scant benefits thereof, there are few attractions to obtaining government recognition, particularly for primary schools.

III

Nature of PUA Schools

The general perception that PUA elementary schools are only a very small proportion of all elementary schools in India gains support from notions imparted in the

existing literature, such as that PUA schools charge high fees, are mainly an urban phenomenon, and cater only to the children of the elite. For example, government of India [GOI 1993:4] states that private schools "opened since independence are located mainly in big cities and towns only to cater to the needs of ever-rising ambitions of middle class parents who can afford to pay high fees for such types of schools". Similarly, education economist Tilak (1990:37) says "private institutions practice exclusiveness through charging high tuition fee and alarmingly large capitation fees or donations... The tuition fees in the private institutions are so high that few lower and middle class house-holds can afford even to apply for admission in these schools". In a similar vein, Govinda (1995:14) thinks that private primary schools in urban areas "are the preserve of children of wealthy parents who can pay high fees".

However, the observation that PUA schools cater only to the economic elite appears to be contradicted by recent research from different parts of India which suggests that private fee-charging education is extremely heterogeneous, drawing its clientele from across the social spectrum. For example, Kingdon (1994) finds that in a sample of 10 recognised PUA schools in urban Lucknow in 1991, monthly tuition fee varied from Rs 20 to Rs 240 in different schools and that within the PUA school sector, schools differed very markedly in their level of resources and teachers' salaries, and in the socio-economic background of their students.

Many researchers have found that PUA schools serve poor areas in India. For instance, based on his field study of education in Baroda slums, Jain (1988) observes that "the field of pre-primary education is replete with non-official enterprises" and that private operators charge between Rs 20 and Rs 50 per month as fees in slum areas of urban Baroda. Nautiyal (1993) notes that 9 per cent of boys and 5 per cent of girls enrolled in Delhi slums attended PUA schools. Based on their survey of schools in New Delhi, Chadha and Singh (1988) find similarly. They say "what is incredible are the absolute [low] levels of income at which demand for private schooling exists. It is incredible because government schools are virtually free". Nor is the phenomenon of private fee-charging schools confined to urban areas. According to Shiva Reddy [1991:374], "even at the primary level many children from rural areas attend private schools in urban areas. Because of the deterioration in the quality of publicly financed schools, private (convent) schools are spreading even in remote areas". Dreze and Gazdar (1996) also find that in rural UP, many parents

send their children to study in PUA schools.

In short, despite contrary notions, it appears that PUA schools are more pervasive and more heterogeneous than thought hitherto, and that they serve children from all social strata and not only the elites.

IV

Size of Private School Sector

A central tenet of this section is the fact that unrecognised PUA schools are not included in educational statistics and that, consequently, published official statistics seriously underestimate the role of fee-charging schools in elementary education. The government of India [GOI 1993:4] itself acknowledges "no doubt large numbers of private schools have been opened since independence but ... many such schools are unrecognised and are not covered under the existing system of collection of educational statistics". According to Dhingra (1991) since registration and recognition of PUA schools is not mandatory in many states, officials have no way of knowing their numbers.

It appears that the number of PUA elementary schools, and most particularly PUA primary schools, may be much greater than that recorded in official statistics because these statistics omit the mushrooming unrecognised schools. For example, Kingdon (1994) reports that discussions with persons who are knowledgeable in the field of education in the Lucknow district of UP suggested that there were several 100 PUA primary schools in urban Lucknow although government statistics reported only 42 recognised PUA primary schools [GOUP 1991:472, Table 54]. Given the exacting conditions for and the scant rewards of recognition, it is not surprising that most PUA primary schools choose to remain unrecognised. This suggests that official

TABLE 1: PERCENTAGE SHARE OF RECOGNISED PUA SCHOOLS IN ALL SCHOOLS BY AREA AND LEVEL

School Level	UP (Per Cent)		India (Per Cent)	
	1978	1986	1978	1986
Rural

statistics hugely understate the numbers of PUA primary schools.

However, even according to official statistics PUA schools have considerably more than a 'negligible' or 'infinitesimal' presence in school education. That is, although official statistics underestimate PUA schools' role, the recognised part of the PUA education sector is significant in its own right in UP (both urban and rural) and in urban India. Table 1 shows the percentage share of recognised PUA schools in all schools in 1978 and 1986 in UP and in India.

Although the proportion of PUA schools has risen in both rural and urban areas, their size as well as growth in urban areas is particularly remarkable. Table 1 shows that in urban areas within a span of just eight years, PUA primary schools grew from having a 9 per cent share of all primary schools in urban India to having a 17 per cent share. At the junior level the growth is even more impressive, taking PUA schools' share in all junior schools from 12 per cent to nearly a quarter of all schools in urban India. In certain states the PUA sector in urban areas is larger than either the G or the PA sector. For example in urban UP, PUA junior schools represent 52 per cent of all junior schools. The share of PUA primary schools (at 34 per cent of all schools) and that of PUA secondary schools (at 15 per cent in urban India) are not inconsequential either. If the rate of growth of PUA schools between 1978 and 1986 has continued then, a decade from 1986, the percentage share of PUA schools is likely to be much greater than that indicated in Table 1.

Another way of illustrating the impressive growth in the role of PUA schools is to compare the growth in enrolments in PUA and other school types over a period of time. Table 2a shows the growth in number of students in schools of different management-type between 1978 and 1986 in urban UP. It shows that, in terms of absolute numbers, enrolments in PUA primary schools rose by 4,18,403 and enrolments in G and PA primary schools rose by a much smaller 1,37,177 (188485-51308). That is, enrolment in recognised primary PUA schools grew three times as much as enrolment in G and PA schools. Put another way, 75 per cent of the total increase in primary enrolments between 1978 and 1986 was absorbed by PUA schools! Similarly, enrolment in junior recognised PUA schools grew by one and a half times more than the enrolment in junior G and PA schools. Thus, in junior education, 64 per cent of the overall increase in pupils was accommodated by PUA schools! In other words, the role of PUA elementary schools grew very rapidly between 1978 and 1986, though it is noteworthy that the role

of PUA secondary schools grew only a little; they absorbed only 13 per cent of the overall increase in secondary enrolments over the period.

The equivalent figures for urban India (in Table 2b) show that, in primary education, PUA enrolments grew twice as much as G school enrolments and thrice as much as PA school enrolments. Consequently, 57 per cent of the total increase in primary enrolments between 1978 and 1986 was absorbed by PUA schools! Again, as in urban UP, it is mainly in primary and junior education that the private fee charging sector is booming: the PUA sector did not dominate the growth in secondary level enrolments.

Thus, by official figures, there has been a momentous growth of PUA elementary school enrolments. However, even so, these figures underestimate the true growth of PUA elementary school enrolments which is actually larger. They underestimate the growth and size of the PUA school sector not only because they relate merely to the recognised part of the PUA sector but also, very importantly, because they exaggerate the growth and size of GPA elementary enrolments due to the large-scale over-reporting of student-numbers. The share of the PUA sector in elementary education may be much larger than what is conventionally believed.

OVER-REPORTING OF ENROLMENTS

In the published educational statistics, the relative roles of free (GPA) and fee-charging (PUA) schools in elementary education are

skewed in favour of free schools not only because non-recognised PUA schools are excluded from the statistics but also importantly because the role of GPA schools is exaggerated by large-scale over-reporting of their student numbers.

Heyneman (1980) reports from source documents that in 1961, departmental enrolment figures for children below 14 were 20 per cent higher than the 1961 census enrolment figures for that age-group but the 1971 census data show that, "the discrepancy was twice as high - 41 per cent". It appears that over-reporting has worsened over time. The director of elementary education at the ministry of human resource development in India, compares enrolment ratios in official statistics with census results (Dhingra 1991). She states that the 1981 census data showed only 47.2 per cent of children in the age group 6-11 years as attending school as against a gross enrolment ratio of 80.5 per cent collected by the internal educational information system, suggesting that in 1981 departmental enrolment figures were 71 per cent higher than census figures! Even allowing for the fact that in their estimates of the gross enrolment ratio, departmental data include under- and over-aged children who are enrolled in the primary cycle, the discrepancy between departmental and census data is massive.

The above estimate of the extent of over-reporting of enrolments based on 1981 data is corroborated by a comparison of enrolment figures estimated in NSSO (1991:39) based on 1986-87 (42nd round) National Sample

TABLE 2A. GROWTH IN ENROLMENTS BY LEVEL AND SCHOOL-TYPE IN URBAN UP, 1978-86

Level	School-Type	1978	1986	Absolute Increase	Percentage Increase

NCERT (1992), Fifth All India Education Survey, Table 170, pp 1086-1115.

Survey data and those in departmental data for 1986 (NCERT 1992:1086-1115). NSSO estimates that only 67,968 thousand students were enrolled in elementary education in 1986-87 in India but according to departmental data, 113,186 thousand students were enrolled in elementary education in India in 1986. Thus departmental enrolment figures are inflated by 67 per cent. Other researchers have also recorded that enrolments in official documents in India are greatly over-estimated due to large-scale over-reporting, for example, Prasad (1987) and Tilak (1985:6-7, 16). Dhingra (1991) notes that

continuous over-reporting by schools has bloated the enrolment figures to such proportions that the system is no longer brave enough to explore the truth or face the lie. The differences between departmental data and the census or National Sample Survey data are conveniently ignored since in any case, there is no strong objection in any quarter to the perpetuation of this absurdity. Its main effect is on educational planning, which under these conditions, has ceased to be taken seriously

There is a wealth of evidence of over-reported enrolments in micro-studies too. In their study of primary schools in five districts of Madhya Pradesh, Govinda and Varghese (1993:128) state that "it is difficult to get accurate and reliable information from the school records as the enrolment figures given vary widely from the attendance figures". Dreze and Saran (1993:41) find that in Palampur in western UP, out of an enrolled 54 students in the G primary school, only 25 students (or 46.3 per cent) were in school on the day of the survey visit in February 1993, though this may be partly due to low attendance. In Kingdon's (1994) data-collection too, some GPA schools reported enrolments in class eight that were four times as high as the number of students in attendance on the day of the survey. Prasad (1987) found that in Andhra Pradesh, "actual attendance during the days of the investigation was between 20-30 per cent of the impressive number of children found in the school records in most of the villages... however, the school records were manipulated to show over 60 percent attendance".

While there are no reasons for PUA schools to wilfully misreport student numbers in the schools' returns, there are strong incentives for G and PA schools to exaggerate enrolments. Firstly, teachers are meant to be allocated to GPA elementary schools on the basis of a pupil-teacher ratio of 40:1. Secondly, PA schools' non-salary (admittedly tiny) grants are based on self-reported student numbers in the schools. Thirdly, school staff feel that if student numbers are truthfully reported to have dropped to unviable levels due to a lack of

demand, the subsidy to the school would be withdrawn and they would lose employment or face a transfer to another school.

There are other motivations for government-funded schools to over-report enrolments. Dhingra (op cit p 4) states that until 1985, "targets for elementary education were laid down in terms of additional enrolment. A system of annual target setting was devised... whereby each state was given a precise target. The states in turn divided the figure among divisions, districts and blocks and the blocks among schools... the school head was given a target of enrolment that generally had no relationship to the size of his school or number of school-going children in the school catchment area, but represented a mark-up over his previous year's enrolment figure...". Referring to these 'enrolment drives', Dhingra (p 11) states "considering the manner of target fixation and information collection, it is not surprising that enrolment data should be over-reported. The system is judged on the basis of additional enrolments achieved, and consequently conspires together to show that given targets are met". As Dhingra says, indeed one can

sympathise with the cynics who claim that the system was designed to collect information that shows only progress. These explanations are similar to those in Prasad (1987) for the state of Andhra Pradesh.

Thus, the evidence on large-scale over-reporting of enrolments in elementary education is compelling and it is consistent with the incentives for over-reporting that teachers and school authorities face. However, we have not come across any evidence that there is over-reporting of enrolments in secondary education. This is because secondary education in India is supply constrained: most secondary schools are genuinely over-crowded, primarily because of the inadequate number of GPA secondary schools and also because there are far fewer PUA educational institutions at the secondary level than at elementary, as we show in section V.

The purpose of discussing the extent of over-reporting of GPA elementary school enrolments was to show that in official statistics, the enrolment share of PUA schools appears smaller than it is partly because the statistics greatly exaggerate the enrolments

TABLE 3A: PERCENTAGE SHARE OF PUA ELEMENTARY (PRIMARY + JUNIOR) SCHOOL ENROLMENTS IN TOTAL ELEMENTARY SCHOOL ENROLMENTS

	UP		India	
	Official Data (1986-87)	Survey Data (1994-95)	Official Data (1986-87)	Survey Data (1994-95)
Rural	8.5	27.2	2.0	9.8
Urban	37.1	80.7*	16.9	na

* This figure is based on a sample survey of urban Lucknow only and not on urban UP as a whole. Source: Official figures for UP compiled from GOUP (1991), Table 137, p 780 and for India from NCERT (1992), Table 170, p 1086-1115. The survey figures for rural UP and rural India are based on NCAER survey data reported in Shariff (1996). The urban UP survey figure is based on the findings of a random sample survey of 1,000 households carried out by the author in Lucknow Urban Agglomeration in 1995. This data collection is described in Kingdon (1995).

TABLE 3B: STATEWISE DISTRIBUTION OF STUDENTS AGED 6-14 YEARS BY TYPE OF SCHOOL, RURAL AREAS ONLY

States	Distribution Based on Official Data (NCERT)		Distribution Based on Household Survey Data (NCAER)	
	GPA Schools	PUA Schools	GPA Schools	PUA Schools
Haryana	99.8	0.2	87.1	12.9

of GPA schools. However, as Tables 1 and 2 showed, despite this source of under-statement of PUA schools and their enrolments, their role in elementary education is sizeable.

A SIMPLE SIMULATION

We have argued so far that there are two main sources of error in the officially collected data on school enrolments: one due to the exclusion of non-recognised PUA schools and secondly because of the over-reporting of enrolments in government-funded schools, namely GPA schools. While there is no easy way of taking into account errors due to the exclusion of non-recognised schools, it is possible to estimate the true relative size of the GPA and PUA sectors by correcting for the inflation in GPA enrolments and this section attempts to do that. It shows that just correcting for the over-statement of GPA enrolments would push up the enrolment share of recognised PUA primary schools in urban UP from 40 per cent (in official statistics)⁹ to 60 per cent, and in urban India, from 18 per cent to 27 per cent. While these results are mere simulations, they are nevertheless suggestive.

The calculation is as follows: We know that departmental enrolment figures are 71 per cent higher than census figures. However, we also know that the discrepancy between census and departmental primary enrolment data is partly due to the 'grossness' of the departmental data, i.e. due to including under- and over-aged children who are enrolled in primary classes (we call this the 'grossness' factor), and partly due to dishonest roll-inflation. Unfortunately, we do not know the net enrolment ratios and so have no reliable guide on how much of the discrepancy is due to the grossness factor. However, we can take a liberal estimate of the grossness factor (say 20 per cent)¹⁰ and a conservative estimate of the roll-inflation factor (71 per cent - 20 per cent = 51 per cent).

The relative roles of government-funded and private schools can now be estimated as follows: In the absence of more disaggregated data, assume, rather crudely, that departmental primary enrolment data are inflated by the same percentage (51 per cent) in all states and regions (urban and rural). For a given area, take the departmental primary enrolment figure and deflate it by 51 per cent to obtain the true total enrolment, say x . True GPA enrolments can now be estimated by subtracting PUA enrolments from x (given the premise of the previous section that there is no roll-inflation in PUA schools).

Example. In 1986 in urban UP, there were 2,033,220 children enrolled in primary schools according to departmental data (calculated from table 2a). We deflate this

figure by 51 per cent to get the actual total enrolment of 1,346,503. From this, subtract PUA primary schools enrolments (811,903, see Table 2a). Thus, true GPA enrolment in primary schools in urban UP in 1986 is estimated to have been

$$1,346,503 - 811,903 = 534,600.$$

In other words, GPA primary enrolments constituted a mere 40 per cent of all primary enrolments in urban UP in 1986. The majority, namely 60 per cent, of the primary school-going children attended fee-paying private schools! Similar calculations for urban India would push up the enrolment share of PUA primary schools from 18 per cent in official statistics (based on Table 2a) to 27 per cent, once the exaggeration in GPA enrolments is taken into account. If it were possible to take into account the enrolments in non-recognised PUA schools, the enrolment share of PUA primary schools would show itself to be even higher.

SURVEY DATA

One way of overcoming the problem of inaccurate official statistics (which are based on school-returns) is to look at the results of household survey data. This avoids the problem of under-enumeration of PUA schools and of their enrolments because such data does not distinguish between recognised

and non-recognised PUA schools when asking households what type of school a child attends, and because households have no incentive to over-report the number of children enrolled in free, GPA schools. The only national survey data that reports on the type of school attended by children is a 1994 household survey carried out by the National Council of Applied Economic Research (NCAER).¹¹ The results of its findings are available for rural areas only but not yet for urban areas. However, a 1995 survey of 1000 households carried out by the author in the Lucknow urban agglomeration¹² gives an estimate of school-types attended by children for an urban area of Uttar Pradesh. These figures are presented in table 3a which also shows the latest available official data on UP and India. Table 3b gives the equivalent figures for rural areas of major Indian states.

Unsurprisingly, tables 3a and 3b show some remarkable discrepancies between official data and independent survey data. For example, in rural Haryana, official statistics showed that a mere 0.2 per cent of all elementary school children were studying in PUA schools while household response data shows 12.9 per cent of children attending PUA schools. In rural India as a whole, while official data showed only 2 per cent of elementary school-goers as attending PUA schools, household survey data show about

TABLE 4 PUA RECOGNISED SCHOOLS AS A PERCENTAGE OF ALL SCHOOLS IN URBAN AREAS, 1986

School Level	Uttar Pradesh		India	
	Number	Percentage	Number	Percentage
Primary schools	3171	34.4	8794	16.6
Junior schools	1750	51.9	6320	24.4
Secondary schools	119	5.4	3237	14.7

Notes: PUA secondary schools affiliated to the ICSE and CBSE boards (which are all-India examination boards rather than state examination boards) appear not to be included in official statistics so that the figure of 119 is somewhat underestimated. Unrecognised PUA schools, which exist only at primary and junior level are also not included in official statistics so that their numbers above are also underestimates.

10 per cent of children to be in PUA schools. In urban UP, the discrepancy is very large (Table 3a), the percentages varying between 37 per cent and 80 per cent. While some of these discrepancies are almost certainly due to the growth of PUA schools in the period between 1987 and 1995, a good part can probably be attributed to the under-enumeration of PUA schools, enrolments in official statistics due to (i) omitting the non-recognised schools and (ii) the inflation in GPA school enrolments.

Table 3a shows that PUA schools have a very substantial presence in school education (27 per cent enrolment share) in rural UP and that they teach 80 per cent of all children enrolled in elementary education in the urban part of Lucknow district! While the situation in Lucknow may not be representative of that elsewhere in urban UP (for example, Lucknow is likely to be a more prosperous district than many others in UP because it is the state capital), it is nevertheless highly suggestive. It is likely that fee-charging private schools teach the majority of the urban elementary-age population in UP.

However, the case of UP cannot be generalised to India as a whole. Table 3b suggests considerable inter-state variation in the role of private schools. It shows that such schools have a much smaller proportionate role in India than in UP or in states like Punjab, Haryana, and Kerala. Even so, the share of PUA elementary schools at about 10 per cent in rural India is not insignificant, and may be quite high in urban India if the extent of discrepancy between official and survey figures is as large for urban areas as for rural areas.

In sum then, far from being infinitesimally or negligibly small as sometimes claimed, the share of the PUA sector in Indian education is substantial and has grown over time. Official estimates greatly understate the role of this sector by ignoring non-recognised PUA schools and by exaggerating the relative role of GPA schools.

PRIVATE TUITION INDUSTRY

Another area of private enterprise in education that is not captured in official statistics is the private tuition and coaching 'industry'. Expenditure on private coaching appears to be a substantial proportion of total household educational spending in India. For example, GOUP (1992:19) shows that in urban UP, on average, 23 per cent of household educational expenditure (all fees, books, uniform, private tuition/coaching and travel) of secondary and higher education students was on private tuition or coaching.

A good proportion of students appear to take private tuitions in urban areas. For example, in urban Lucknow in 1991, out of a sample of 928 students of class 8 in G,

PA and PUA schools, 34 per cent reported taking private tuition [Kingdon 1994]. In a 1995 survey of 1000 households in urban Lucknow agglomeration, 39.3 per cent of all children enrolled in secondary schools took private home tuition (survey described in Kingdon 1995). Chadha and Singh (1988:3) report that in their sample of primary schools in New Delhi, 37 per cent of all G school students and 28 per cent of all PUA students took private tuition.

While the above survey-based evidence on the magnitude of private tuition-taking is suggestive, there are, as far as the author is aware, no hard figures on the size of the private tuition industry. The evidence for its spread is mainly incidental or anecdotal, coming from the preponderance of newspaper advertisements by private tutors and evening coaching colleges, and from interviews with parents.¹³

The rapid increase in the incidence of tuition-taking documented by so many in India [see for example National Commission on Teachers 1986:80; Muzammil 1992:5; and GOI 1985:30] shows that the well-off whose demand for fee-levying schooling in the mainstream education sector is frustrated, create their own surrogate or subsidiary private fee-paying education sector where they can dictate the quality of the service and which operates mainly in the evenings. The private tuition 'industry' in India has been the cause of concern because of its perceived detrimental effects on the main education system (National Commission on Teachers *ibid*, GOI *ibid*). Yet this subsidiary market in education as Muzammil (1992:5)

calls it, is growing in response to private demand.

CAUSES

While we have discussed the size and impressive growth of the fee-charging private sector, little has been said about the causes of this growth. It is clear that government-funded elementary education is not supply-constrained; indeed most surveys suggest that such schools are under-utilised due to a lack of demand. Thus, lack of capacity in GPA schools is not a cause of the growth of PUA elementary schools. The two main other possible explanations of the growth of PUA schools are (a) the effect of rising incomes on the demand for private schooling, and (b) the effect of a breakdown in the functioning and quality of state-funded elementary schools. While appealing a priori, explanation (a) appears not supported by evidence in India: for example, Uttar Pradesh has one of the lowest per capita incomes among all states in India [Dreze and Sen 1995, Table A3] and yet the role of PUA schools is by far the greatest there among all states (see Table 3b above). While we do not dismiss the possibility that at least part of the private sector may be income-led, the final explanation, namely the poor functioning of state elementary schools, is probably more important explanation of the growth of PUA elementary schools.

That government-financed elementary schools in India are grotesquely under-resourced is well-documented by many analysts and researchers, and this contributes

TABLE 6: RECOGNISED PUA ENROLMENTS IN CLASS 8 AND 9 IN URBAN UP, 1978 AND 1986

Year	Enrolled in Classes 6 to 8	Estimated to be Enrolled in Class 8	Enrolled in Classes 9 to 10	Estimated to be Enrolled in Class 9	Number in Class 9 as a Percentage of Number in Class 8
1978	109724	32425	13510	7344	22.6
1986	396178	132059	72899	36450	27.6

Notes. The figures for enrolment in class 8 and class 9 in 1978 are actuals but those for 1986 are estimates. Column 3 is estimated by dividing column 2 figures by 3 since there are three years in the junior cycle. Similarly, column 5 is estimated by dividing column 4 figures by 2 since there are two years in the lower secondary (high school) cycle.

to their lack of effectiveness. Another major reason for the poor functioning of state-funded schools is their lack of accountability. Government-paid teachers (that is, teachers of G and PA schools) have little incentive to do their job seriously: their appointment is permanent and their salaries are not related to work performance. As Dreze and Saran (1993) report from Palampur in UP, the teacher of the village school rarely took the trouble of turning up at all and even when a teacher was present in school, little teaching actually took place. Similar findings emerge from a number of field studies from different parts of India cited in Dreze and Sen (1995) and in the companion volume [Dreze and Sen, 1996, chapter by Dreze and Gazdar]. This virtual breakdown in primary education as documented by many analysts, is ample cause for parental inconfidence in the publicly-financed education system.

Several accounts indicate that the exodus from government-financed elementary schools to private fee-charging schools reflects this breakdown of the free system. A report by National Institute for Educational Planning and Administration (NIEPA) (1990:17-18) notes that existing free educational facilities are being under-utilised. The World Bank (1989:48) comments on the apparent lack of demand for state-funded basic education while enrolments in private schools rise. It notes that low utilisation of public educational facilities is partly a response to the perceived quality of services being offered. At the secondary level, the inadequacy of PUA options (due to tighter recognition rules and greater controls) means that inconfidence in G and PA secondary schools is gauged by the size and growth of the private tuition industry.

It appears that disenchanted parents abandon impoverished state-funded schools, bypassing the free public option for the costlier PUA schools and/or private tuition. While the GOI (1985:53) calls the parents who do so 'gullible',¹⁴ the parents' behaviour appears to be a rational response to the failing public system of education.

V

Elementary and Secondary PUAs

The discussion so far has sought to show that fee charging private education is pervasive in UP and in urban India, and that its role has grown rapidly relative to the growth in free schools. In this section, we consider the relative roles of elementary and secondary PUA schools.

Both Tables 1 and 2 showed that in urban UP and to some extent in urban India, PUA schools have a smaller role in secondary education than in elementary. In other words, fee-charging schools have a

prominent role in basic education and only a tiny role in secondary education. Fee-levying institutions are more scarce as one moves from elementary to secondary education.¹⁵ Both Tables 2a and 2b showed that according to official figures, the fastest growth in PUA enrolments has occurred in primary schools, followed by junior schools, and that enrolments in PUA secondary schools have grown but little in urban UP and urban India. This is partly due to stricter government regulations and recognition rules at the secondary level, which constitute a barrier to the entry of private operators in the secondary school 'market'. It is also partly due to the state government policy to bring PUA junior and secondary (but not primary) schools into the aided list, that is, to turn PUA junior and secondary schools into PA schools, a phenomenon whose equity effects we discuss later in the paper.

Table 4 shows that while there are plenty of PUA elementary schools in urban UP, there is a severe relative shortage of PUA schools at the secondary level: whereas in 1986 in urban UP there were 1,750 PUA junior schools, there were only 119 PUA secondary schools. The same story emerges from Table 5 which shows that while it is not the case in rural India as a whole, it is true in UP (both rural and urban) and urban India that the percentage share of enrolments of PUA schools is much greater in elementary than in secondary education, with PUA enrolments' percentage share in primary education constituting from about double (in urban India) to about six times their share in secondary education in urban UP.

The effect of the abundance of PUA elementary and the relative scarcity of PUA secondary schools can be seen in Table 6. Out of an estimated 1,32,059 PUA students in class 8, only 36,450 or 27.6 per cent could find places in a PUA class 9 in 1986 in urban UP, and the situation has not improved much since 1978.

Finally, we can show the 'squeeze' that occurs in the availability of PUA schools at the secondary level by noting the percentage of PUA primary school pupils who are able to find admissions in PUA secondary schools. Table 7 shows that only 12.2 per cent of students who chose and paid for PUA schooling at the primary level were admitted into a PUA institution for their secondary schooling in urban UP, though the squeeze is less severe in urban India as a whole. There is adequate capacity in PUA secondary schools to accommodate only a fraction of the graduates of PUA elementary schools. If we consider that unrecognised PUA elementary schools' enrolments are not included while those of all PUA secondary schools are, the relative size of the PUA secondary sector *vis-a-vis* the PUA elementary sector is even smaller.

VI

Equity-effects of Schooling System

It is worth noting at the outset that since the PUA secondary school sector is much smaller than the PUA elementary sector, it is supply-constrained and rations its places by higher fees and entrance (ability) tests. It is therefore a high fee, elite sector with a much more privileged student-intake than the PUA elementary school sector.

The abundance of PUA elementary schools and the dearth of PUA secondary schools obliges many well-off students who are willing and able to pay – and who did pay for their schooling up to class 8 – to attend free G or PA secondary schools. Consequently, much of the scarce public educational resources in urban areas are spent on the many well-off students who have no choice but to partake of subsidies at post-elementary education levels. Thus, the mix of free GPA and fee-charging PUA schools across elementary and secondary levels is inequitable.

We stated earlier that apart from the stricter control and regulation of PUA secondary schools, one of the other main reasons for the relatively slow growth of PUA secondary schools was the government's policy to bring PUA junior and secondary schools into the aided list, that is, to make them grant-in-aid or PA schools.¹⁶ The equity effects of this policy are unambiguously adverse: students who were able and willing to (and indeed did) pay for the full cost of their education in a PUA school suddenly become recipients of public subsidies when their school is made PA. No longer do they have to pay any fees, as the state now bears the total responsibility for salary payments, etc., in the school. In other words, meagre public educational resources are perversely allocated to the relatively well-off students.

Nor is this all. The formula for funding PA schools has adverse equity effects. Since PA schools – most of which are in the secondary school sector – get only their salary payments from the state government treasury and meagre imputed fee grants, they face an acute need for cash to cover at least the essential non-salary costs. As a result, most of them run unrecognised PUA primary sections to generate surpluses to cross-subsidise their government-funded, tuition-free, junior and secondary sections. Kingdon (1994, chapter 7) found that eight out of 10 PA junior and secondary schools in a school survey of Lucknow city ran such unrecognised PUA primary sections in 1991. The schools are typically run in two shifts, so that all students share the same facilities but mainly the fee-paying primary section pupils pay for these facilities. Upon reaching class 6, the primary section fee-paying pupils enter the fully subsidised PA junior section

where they pay no tuition fees. This implies that many students have to face a financial hurdle in order to access government educational subsidies: those who are financially able to pay for primary schooling are then able to enjoy publicly funded junior and secondary schooling. This is doubly inequitable because it targets the well-off for subsidy.

Due to the higher incidence of drop-outs among them, children of the poor are better represented in elementary education levels and relatively less well represented at the secondary and higher levels. It is regressive that fee-charging schools have a prominent role in elementary and a relatively much smaller role in post-elementary education. Equity considerations suggest that free, publicly funded education should take a much more substantial role in elementary education than is the case at present. In his book on educational finances in UP, Muzammil (1989:152) also thinks it "against the equity norms that there exist institutions at lower levels which are run privately... and in that case almost [the] total cost is paid by students, whereas invariably all institutions of higher learning are heavily subsidised by the state".

VII Conclusions

This paper has presented evidence on an issue which is largely unexplored in India at present, namely the size, growth, and equity-effects of fee-charging schools in Indian education. It has also shown – from comparisons of enrolment rates from education-department data, census, and National Sample Survey data – that enrolments in government-funded elementary schools are greatly exaggerated in official statistics. The paper has discussed the motivations for such roll-inflation and examined the effect of this overstatement for the relative roles of free and fee-charging schools in published data. It has also considered the role of the unrecognised schools. Finally, it analysed the equity-effects of the mix of free and fee-charging schools at elementary and secondary levels. The main conclusions of the work follow.

The fact that unrecognised PUA schools are not required to be registered and cannot therefore be enumerated in official data has varied consequences. Firstly, the education departments do not know the real extent of fee-charging private involvement in elementary education, though anecdotal evidence and household surveys find it to be a large and growing sector. Secondly, coverage of education is understated if private unrecognised schools are ignored in official statistics. Finally, the published figures on the relative roles of free and fee-levying

educational provision are skewed (magnified) in favour of G and PA schools. The role of the free school sector is exaggerated so that it appears that elementary education is largely state-supported, leading to a false sense of satisfaction with the status quo. While it may be expedient for the government to magnify its own role and underplay the role of fee-charging education, the contribution of PUA schools to the elementary education effort should not be ignored for important equity-related reasons.

The abundance of PUA elementary schools and the relative lack of PUA secondary schools in UP (rural and urban) and in urban India, is inequitable. It gives the well-off better chances of acquiring primary education and it obliges a number of students to carry a financial hurdle in order to access junior and secondary education subsidies. Moreover, government subsidies to a large proportion of secondary schools but only to a smaller proportion of elementary schools represents an inequitable expenditure of scarce educational resources since children of the poor are better represented in elementary than in secondary education.

If fee-charging education is really much more widespread than that indicated by official statistics and if PUA schools are plentiful in elementary but scarce in secondary education, as we have argued, then there are serious reasons to worry about the equity effects of the prevailing school education system. The sooner the public sector informs itself of the true extent of fee-levying elementary education in India and faces up to the embarrassment of such a realisation, the sooner can the task of taking equitable measures begin.

Notes

[I would like to thank, without implicating in the final product, Robert Cassen, Jean Dreze, Haris Gazdar, and Barbara Harriss-White for useful comments on earlier drafts of this paper.]

1 Education was until 1976 a state subject and although since then it has been a joint state and centre subject, there are nevertheless regional diversities in the administrative structures of education that have evolved over the decades since independence and even before.

2 The heavy regulation of PA schools started with the passing of the Salary Distribution Act 1971 in UP and similar acts in other states, for example the Direct Payment Agreement 1972 in Kerala [Mathew 1990]. These acts greatly centralised many aspects of the management of PA schools such as the fee these schools could charge, taking over the salary payment of staff and the recruitment of staff.

3 There is a degree of inter-state variation in the government regulation of PA schools. For example, in Tamil Nadu PA

schools are less regulated than in many other states.

4 As from 1990, education up to the secondary level has been made tuition-free in UP and in many other states. Before then, G and PA schools could charge prescribed nominal fees but they had to deposit the meagre fee revenues into the state government treasury. PA schools then got 15 per cent of this fee revenue back for non-personnel costs. Since the abolition of fees, however, PA schools get back 15 per cent of imputed fee revenues but, as before, this is a tiny sum since fee levels were very low, typically a maximum of Rs 8 per month for boys in secondary classes and nil for girls up to secondary classes.

5 PUA schools become PA schools if they are brought under the government grant-in-aid scheme. While teachers of PUA schools almost always want their schools to gain PA status since this ensures permanency and minimum salaries, the managers of PUA schools usually resist government aid in UP because they lose management control and the opportunity to charge fees and make profits.

6 To be eligible for recognition in UP, a PUA school must be a registered society, have an owned rather than a rented building, employ only trained teachers, pay salaries to staff according to government prescribed norms, have classrooms of a specified minimum size and charge only government-set fee rates. It must also instruct in the official language of the state. A recent condition for recognition of a private school is that it must not be situated within 5 kilometers of a G school.

7 While it is in the teachers' interest to gain PA status for the school (since they would then be paid G school salary rates), it appears that this conflict of interest between teachers and managers is usually resolved to the management's advantage since the latter can usually veto an application for government grant-in-aid.

8 In any case, many parents in rural Uttar Pradesh have found a way out sending their children to such unrecognised PUA schools but also, at the same time, enrolling them in a government school simply in order to enable the child to obtain a valid TC (see Dreze and Gazdar 1996 who call this phenomenon 'implicit privatisation' of primary schooling in UP).

9 Derived from table 2a; also see Table 5.

10 A 20 per cent grossness factor can be justified on the following grounds: We stated earlier that in 1961 departmental elementary enrolment figures were 20 per cent higher than the 1961 census based enrolment figures (Heyneman 1980). If we make the liberal assumption that in 1961 there were no incentives for school authorities to over-report enrolments, then the whole of the 20 per cent discrepancy can be attributed to the grossness factor rather than the roll-inflation factor. We also make the reasonable assumption that, over the decades, the 20 per cent figure has remained stable, that is, the proportion of under- and over-aged children who are enrolled in elementary education has remained the same.

11 While the National Sample Survey 42nd Round (1986-87) on 'Participation in

Education' asks children the type of school they attended, its report in Sarvekshana (NSSO 1993) unfortunately does not present the overall proportion of children in government and private schools. The NCAER survey in rural areas sampled approximately 35,000 households in 16 states.

12 See Kingdon 1995 for description of the data collection

13 In my survey of 1000 households in urban Lucknow [described in Kingdon 1995], many parents of secondary school children reported that the children had to take out-of-school, privately paid tuition from their own regular school teachers because the teachers did very little teaching in the school itself but, instead, required their students to come to their homes in the evening for paid extra coaching. The teachers do this as a way of earning an income over and above their government-paid salaries. Parents feel obliged to send their children for such extra coaching because of the fear that, otherwise, the child might fall out of favour with the teacher who might then not award the child fair grades in the final practical examinations

14 GOI (1985:53) states that that "there is an increasing incidence of the establishment of the so called english medium schools which attract gullible parents, mainly because the municipal or government schools are so unattractive". While there may be some reason to doubt the english-medium credentials of a good number of private schools that claim to provide 'english-medium' education, it is not clear that the main parental motive for sending children to such schools rather than to government schools is their advertised medium of instruction.

15 It appears that fee-levying educational institutions are even more scarce at the higher education level than at secondary. Shatrugna (1988) reports that in 1988 there were only 161 fee-charging colleges, which represents a tiny proportion of all higher education institutions in India. Shatrugna gives no source for the figure he cites. The extensive media coverage of the issues surrounding the capitation fee colleges (following the Supreme Court case of Mohini Jain, see Sathe 1992) appears to give an exaggerated sense of the role of these colleges - for in no such coverage have we come across any hard figures on their numbers or growth. In any case, the Supreme Court's ruling fixing maximum fee levels that can be charged in such institutions is likely to have curbed their growth by discouraging new entrepreneurs from investing in such colleges.

Beneficiaries of IPS Subsidy and Impact of Tariff Hike

Girish Sant
Shantanu Dixit

Electricity tariff for irrigation pumpsets (IPS) is one of the most controversial issues in the power sector reforms. It is believed that poor agriculturists need this subsidy and without the subsidy, the food prices will substantially increase. Analysed here is the distribution of IPS subsidy among IPS users in Maharashtra, the likely impacts of consumption-based tariff and tariff hike. The analysis shows that flat (Hp-based) tariff results in highly skewed subsidy distribution and is regressive in nature. Most farmers can pay tariff much higher than usually assumed to be possible.

THE Indian power sector is in grip of many crises, of which the capital crisis is the most talked about. The government has radically changed power policies in an attempt to solve capital crisis. But the survival of SEBs and the power sector in general is still linked to the policies regarding electricity use of agriculture pumpsets (irrigation pumpsets (IPS)).

The subsidised tariff for IPS is one of the most important cause for capital crisis. It is largely believed that: (i) the agriculturists, and especially the poorer section among the agriculturists cannot afford to pay electricity tariff as per the cost of electricity generation and supply; (ii) the cost of production of foodgrains will rise substantially if the electricity tariffs are raised; and (iii) metering agricultural consumption will be very expensive for the SEBs. Hence, electricity tariffs have been kept way below the cost price and the billing of most IPS has been linked to the pump Hp rather than the electricity use.

The power sector has estimated that in 1994-95, the IPS users in the country consumed 69,000 million kWh (mu), which was about 29 per cent of total electricity sales. The average tariff for IPS users was Rs 0.218/kWh. This tariff covered only 14 per cent of the average cost of generation and supply [Planning Commission 1995]. Thus, IPS users received a subsidy of over Rs 10,000 crore in 1995 alone. This subsidy was equivalent to the cost of a 2,500 MW power plant; which is nearly half of the required capacity addition in the country. The policies regarding the IPS also have serious implications for the groundwater situation and the rural economy. Despite such enormous importance, there has been little debate or analysis about the usefulness of this huge subsidy or who benefits from it.

Two different authorities have made opposite assessment of the impact of raising electricity tariff to the level of cost of production and supply. Here we examine these questions in the context of IPS in Maharashtra.

In the ongoing process of SEB restructuring, the consultants and the World

Bank (WB) have suggested that SEBs should charge cost-based tariff to agriculture. In case of UP, the World Bank (WB) consultant has recommended a tariff of Rs 3.5/kWh (in 1995 prices) for the year 2000 [Hayes and Bartlett 1995]. Raising IPS tariff is considered politically difficult. The National Development Council (NDC) had decided that Rs 0.5/kWh should be recovered from IPS users. But only six states have implemented such tariffs [ADB 1995]. Despite the fact that the prevailing tariffs are extremely low, farmers are not willing to pay their electricity bills. The recovery of dues from agriculture sector is very poor. The accumulated arrears of IPS users to the Maharashtra SEB (MSEB), for example, are nearly two and a half times the amount billed in 1996 [MSEB 1996].

ESTIMATING IMPACT OF IPS TARIFF HIKE

The impact of tariff hike on different groups of farmers or crops is rarely analysed. Two studies analysing the impact of the tariff hike could be located. A study by the WB concluded that if the agricultural electricity tariffs are raised to the level of average cost of electricity, then it will lead to significant rise in the cost of the agricultural commodities and will have regressive impact on poor. On the contrary, the Council of Power Utilities (CPU), a consortium of public sector power utilities) has assessed the impact to be marginal if the tariff is raised to two-thirds of average cost of electricity.

The study by the CPU estimated the increase in foodgrain prices due to tariff hike. Based on the amount of IPS consumption claimed by the power sector, the CPU estimated the incremental income to the power sector if tariff is raised to two-thirds of the average cost of supply. It estimated this additional burden on the farm sector to be Rs 2,574 crore per year. It further claimed that if this burden is passed on to the marketable foodgrains (88 million ton in 1989-90), then the cost of foodgrains would increase by Rs 0.3/kg. This increase would have been Rs 0.5/kg in 1993-94. The resultant impact on the citizen is estimated at only Rs 7.5 per month per person (in 1993-94 prices), which is only a marginal one. A

major lacuna in the study is that it attributes the increase in the cost only to the marketable foodgrains. In fact, a large share of irrigation water is used for non-food cash crops.

Another report by the WB, titled 'India - Long-Term Issues in the Power Sector - Technical Report', also estimated the effect of IPS tariff hike and a shift to the consumption-based tariff on the prices of different crops [World Bank 1991]. The study concluded that the prices of cereals and sugar will be most affected. It predicted a respective increase of 7.3 per cent and 3.9 per cent in prices, if tariff was increased to half the 'long-range marginal cost' (ie, Rs 0.88/kWh for Maharashtra in 1990). The average cost of generation and supply in Maharashtra was Rs 0.993 in 1990, only slightly higher than suggested tariff. The report also points out that, (i) rural poor spend over a quarter of household budget on cereals and such tariff increase would have regressive impact and (ii) IPS consumption would significantly decrease.

The conclusions of this study were contradictory to the logic that water intensive crops such as sugarcane rather than cereals will have larger impact. The WB analysis was based on the input-output tables of the Planning Commission. For calculating the impact of the increased tariff, the study used the coefficients from the input-output tables referring to the direct electricity use (as a percentage of value added). These coefficients in the input-output tables are in turn based on the data collected by the Central Statistical Organisation (CSO). About the method of arriving at these coefficients, the CSO says: "Information on electricity consumption (in agriculture) is not explicitly available from CSS. Data on electricity utilised for agricultural purpose is obtained from CEA and is distributed to various crops in proportion to cropwise area irrigated by tube wells and pumpsets" [CSO 1990] (emphasis added).

It implies that CSO too neglects the effect of different water requirement for various crops. Sugarcane, for example, requires nine times as much water (and hence electricity) as jowar. Hence, use of these coefficients would give erroneous results. There are a

few additional factors which have a large influence on the cropwise electricity consumption, but their impact is difficult to account for. These factors are also neglected by CSO. One such factor is the typical crops grown on different IPS configurations. For example, sugarcane is largely grown on lift irrigation schemes (LIS) in Maharashtra. LIS have large delivery heads and long pipe lengths, whereas cereals are mostly grown on well irrigation, which have limited delivery heads and small pipe lengths. Our analysis shows that, one ha of cane grown on a typical large LIS would require about 18 times more electricity than rabi jowar grown on well irrigation. Therefore, distributing electricity consumption uniformly over the area irrigated is highly erroneous and would project substantially higher electricity consumption for cereals than the actual consumption.

Due to use of CSO coefficients, the WB study neglects such issues. Its results are therefore questionable. Contrary to the conclusions of the WB study, our analysis, as described later, shows that farmers growing rabi jowar on well irrigation already pay 40 to 60 per cent of the average cost of supply. Whereas, the LIS consumers (mainly growing cash crops such as sugarcane) pay less than 6 per cent of the average cost. Hence, the effect of consumption-based tariff will be far more on farmers growing water intensive crops than that on other IPS consumers.

Apart from these issues, both studies had one major flaw. These studies analysed the impact of the IPS tariff hike on the cost of production of agricultural produce by averaging out the increased burden on all agricultural production. The production from IPS irrigated area was not distinguished from the production from other irrigated or unirrigated areas. The crops grown on IPS form only a part of the total production. Hence, the direct impact on the IPS users will be substantially higher than the impact estimated by these studies. And the behaviour of IPS users cannot be predicted by looking at the increase in average costs. We need to estimate the direct impact on IPS users.

For the above task, first it is essential to get a clear picture of the existing electricity consumption patterns and the distribution of subsidy among different IPS users and crops. Only then can we comment on the likely impact of tariff increase on IPS users and consequently on crop prices. With a case study of Maharashtra state, we examine the following issues:

Present subsidy distribution and effective tariff paid – distribution of subsidy among different IPS users, and effective tariff (Rs/kWh) paid by different IPS users;

Impact of tariff increase on IPS users – present electricity bills as a share of gross value of produce, and expected electricity bills with introduction of metered tariffs;¹

Possible reduction of impact by improving the end use efficiency.

DEFICIENCIES IN IPS DATA

Though an inquiry into the IPS tariff and inbuilt subsidy is of considerable importance, there are serious data gaps, which make any work on this issue extremely difficult. For example, even the Hp-wise number of IPS was not readily available with MSEB. The state government departments do not have data on (i) area irrigated by IPS, (ii) cropping pattern on wells or IPS irrigated area, (iii) distribution of IPS based on the sources of water, etc. Similarly, the directorate of sugar or the irrigation department is not aware of the amount of sugarcane grown on canal water as against that grown on groundwater or surface water lifts (LIS). Our analysis, based on MSEB's IPS number and the data from the department of agriculture about area irrigated and number of IPS on wells showed a large discrepancy in the total net area irrigated in the state [Sant and Dixit 1996]. Hence, any inquiry in this regard has to be based either on extensive survey or on typical case studies. Present study is based on typical combinations of pump Hp, area irrigated, cropping pattern, etc.

To understand the likely impact of tariff increase and distribution of IPS subsidy on different groups of farmers, classification of farmers is crucial. It is customary to classify farmers on the basis of (i) crops grown, (ii) size of landholding, (iii) income and other economic aspects. On one hand, such classification was found to be impossible for IPS users due to the lack of data; on the other,

a farmer's electricity consumption as well as his choice of crop (hence his income) are closely linked to the availability of water and in turn to the source of water. Therefore, primary classification followed here is on the basis of the source of water (well vs lifts from surface water sources). The applicable tariff (metered vs flat tariff) and the size of pump (in the case of lift irrigation schemes) are also used for classification.

In 1994, Maharashtra state had 18 lakh IPS against 95 lakh agricultural landholdings. IPS owning farmers consumed 8,923 mu, which approximately equals one quarter of the total electricity sales in the state. The average realisation from the IPS users was only Rs 0.23/kWh, which covered less than 17 per cent of the average cost of electricity. As a result, the IPS users received a subsidy of over Rs 1,150 crore in 1994 alone. As per the statement of the deputy chief minister, government of Maharashtra, this subsidy has increased to Rs 2,000 crore in 1996 [Sakal 1996]. IPS users in Maharashtra had an option between (i) metered and (ii) flat tariff. The metered tariff was Rs 0.5/kWh with a constraint of a minimum charge of Rs 90/Hp/year. This minimum charge was equivalent to the consumption in 240 hours of pump usage.² The other option of flat tariff was Rs 300/Hp/year.³ For a pump operation of more than 800 hours a year, the flat tariff was more economical than the metered tariff.

In 1994, about a quarter of IPS users had opted for the metered tariff linked to the consumption and the rest, 75 per cent, users paid Hp-based tariff. The consumption of

TABLE 1: CONSUMPTION AND TARIFF PAID BY DIFFERENT GROUPS OF IPS USERS (1993-94)

	Metered IPS	Unmetered IPS		Total
		Large (LIS)	Small IPS	
No of Beneficiaries (0000)	428	192*	1,324	1,944
Connected load (MW)	1,399	341	4,567	6,307
Electricity consumption (MU)	211	1,530	7,182	8,923
Applicable Tariff (Cr Rs)	19	14	184	217
Subsidy (Cr Rs)	14	226	936	1,176
Share of IPS subsidy (per cent)	1	19	80	100
Subsidy (Rs/Beneficiary)	331	11,777	7,049	Avg 6,049
Percentage of landholdings	4.5	2.0	14.0	20.5

Notes: Average cost of generation and supply for MSEB (1993-94) was Rs 1.56/kWh. The minimum tariff for metered and unmetered IPS was Rs 134 and Rs 402 per kW per year respectively.

* The number indicated the beneficiaries of 3,200 large LIS connections.

TABLE 2: EFFECTIVE TARIFF PAID BY UNMETERED IPS ON WELLS

Crops	Estimated Consumption kWh/Yr	Pump Hp	MSEB Bill* (Rs/yr)	Effective Tariff Rs/kWh
1 Sugarcane	7,855	5	1,500	0.19
2 Wheat, summer groundnut	3,927	5	1,500	0.38
		3	900	0.23
3 Wheat	1,309	3	900	0.69
4 Jowar	873	3	900	1.03

Notes: Assumptions: Area irrigated per IPS = 2 Ha/IPS; Static head = 10 meters, overall pumpset efficiency = 20 per cent and water losses = 5 per cent.

* The MSEB bill calculated for a tariff of Rs 300/Hp/Yr. The effective tariff is arrived at by dividing the electricity bill by the electricity consumption.

these 75 per cent IPS users is not metered and is estimated by MSEB. The method of estimation is not transparent. And doubts have been expressed about the real level of consumption. [Roy 1996; Reddy et al 1991]. The consumption of metered IPS was only 211 MU, i.e., 2.4 per cent of the total IPS consumption. The connected load of these users was about 1,400 MW. Based on the consumption and the connected load, their consumption per Hp works out to be only 113 kWh/Hp/yr. At this level of consumption, they would be charged the minimum tariff of Rs 100/Hp/yr.⁴ Therefore, these users effectively paid a tariff of Rs 0.88/kWh. The average cost of generation and distribution for MSEB was Rs 1.56/kWh. Hence, these users received a subsidy of Rs 0.67 /kWh. For all metered consumers this subsidy works out to be Rs 14 crore of the total IPS subsidy of over Rs 1,150 crore.⁵ Implying that, the 75 per cent of the IPS users received over 98 per cent of the IPS subsidy.

The conclusions possible from these data are: (i) about four-fifths of the farmers do not have pumps and do not benefit from the IPS subsidy, (ii) even among the beneficiaries one quarter of beneficiaries get negligible subsidy. The limitation of this analysis arises from the fact that, the group of farmers that we can isolate as the largest beneficiary is quite large, over 13.5 lakh; and the cropwise analysis of subsidy distribution is not possible. The following sections try to focus the conclusions with the use of additional information. This includes information about (i) large IPS connection of the co-operative lift irrigation societies (LIS), (ii) typical pumpset efficiencies and possible energy savings, (iii) the recommended crop water use, crop yields on irrigated area, and the crop prices.

Among the IPS consumers paying the Hp-based tariff, it is possible to distinguish the large LIS users from other users which are usually small consumers. About 3,200 co-operative lift irrigation societies (LIS) are in operation in the state. These LIS irrigated 2.4 lakh ha using the surface water sources [Sant and Dixit 1996:25]. The connected load of these users has been estimated at 341 MW, and the actual beneficiaries at 1.91 lakh farmers.⁶ The LIS are designed for 3,000 hours of operation per year, but they operate for much longer periods, generally between 4,000 to 5,000 hours a year. Assuming an average operation for 4,500 hours per year and total connected load of 341 MW in 1993-94, these large LIS would have consumed 1,530 mu. As most LIS pay flat rate tariff, these LIS would be expected to pay Rs 14 crore (@ Rs 300/Hp/yr).

As per MSEB data, the unmetered IPS consumed 8,712 mu and had a connected load of 4,908 MW. Considering the MSEB claim to be correct, remaining 13.2 lakh

small unmetered IPS consumed the balance 7,182 mu. These small unmetered IPS would account for a connected load of 4,567 MW and hence were supposed to pay tariff of Rs 184 crore.

The consumption and the connected load of unmetered consumers has been estimated above. The consumption and the applicable tariff for the metered IPS is calculated in the previous section. Based on this analysis, Table 1 shows the number of beneficiaries, electricity use, and the subsidy availed for these three categories of IPS users. The subsidy is calculated by subtracting the applicable tariff from the cost of electricity consumed (based on the average cost of supply for MSEB).⁷

The accompanying figure plots the number of beneficiaries as a percentage of the agricultural landholdings in the state (on X-axis) against the subsidy received per beneficiary per year (on Y-axis). The reliability of power sector data regarding the IPS number as well as consumption is under doubt. The IPS consumption may be actually lower or the IPS in operation may be fewer than the MSEB claims. In either case the above conclusions regarding iniquitous subsidy distribution remain valid. If the IPS consumption is lower than claimed, then the estimated consumption of the 'small unmetered IPS' (third category) would be accordingly lower. This would imply more skewed subsidy distribution than shown here. The LIS co-operatives in Maharashtra have been promoted by the sugar factories for increasing cane production in their area

(NABARD 1991). Generally one-third to one half of the area irrigated by large LIS is under cane. For the three sample LIS analysed; the average cropping pattern was 47 per cent sugarcane, 24 per cent summer groundnut, 32 per cent rabi wheat and about 20 per cent rabi jowar (among major non-kharif crops with area as percentage of net irrigated area). Assuming that the recommended water use was adhered to, 75 per cent of the water output of LIS was used for sugar cane. Extrapolating this to all the LIS co-operatives, 1.13 lakh ha of cane grown by LIS co-operatives received a subsidy of Rs 170 crore (Rs 15,044/ha of cane). On the other hand, metered IPS users have very small pump usage, which is expected to be used for irrigating single non-water intensive rabi crops (mainly cereals). These users received a much smaller share of the subsidy. This shows the regressive nature of IPS tariff in Maharashtra, in which the cereal growers benefit the least, while the cash crop cultivators benefit the most.

This section estimates the effective per unit tariff (Rs/kWh) paid by different types of IPS consumers. As mentioned earlier, the effective tariff for metered IPS works out at Rs 0.88/kWh. Among the unmetered IPS, differentiation is done between the LIS users and the IPS on wells. In the case of Hp-based billing, the effective (per unit) tariff depends on the hours of pump usage. Higher the pump usage, lower is the effective tariff.

The LIS are usually promoted for sugarcane, and have large static heads as well as long pipes. Hence, the hours of usage

TABLE 3: PRESENT ELECTRICITY BILL AS PERCENTAGE OF GROSS VALUE OF PRODUCE FOR MAJOR CROPS

Category of User	GVP (Rs/Ha)	Pump Hp Per Ha (Hp/Ha)	Electricity Bill		Electricity Use (kWh/Ha/yr)
			(Rs/Ha)	(Per Cent GVP)	
Large LIS	41,782	about 18	540	1.3	6,075
IPS on Well (Crop Hp)					
Sugarcane, 5	66,400	2.5	750	1.1	3,740
Wheat, summer groundnut, 5	31,468	2.5	750	2.4	1,964
Wheat, summer groundnut, 3	-do-	1.5	450	1.4	-do-
Rabi wheat, 3	10,738	1.5	450	4.2*	654
Rabi Jowar, 3	8,673	1.5	450	5.2*	436

Note: * Calculated for flat tariff. If these consumers opt for metered tariff the corresponding values would be 3.0 per cent and 2.5 per cent for wheat and jowar respectively.

TABLE 4: IMPACT OF CONSUMPTION BASED TARIFF ON FARMERS
(Values as Per Cent of Gross Value of Produce)

Category of User	Re 0.50/kWh (NDC)		Rs 1.73/kWh (Avg Cost)	
	New Bill	Increased Burden	New Bill	Increased Burden
Large LIS (per cent)	7.3	6.0	25.2	23.9
IPS on Well (Crop Hp) sugarcane 5	2.8	1.7	9.7	8.6
Wheat, summer groundnut, 5	3.1	0.7	10.8	8.4
Wheat, summer groundnut, 3	-do-	1.7	-do-	9.4
Rabi Wheat, 3	3.0	-0.8 (0)	10.5	6.3 (7.5)
Rabi Jawar, 3	2.5	-2.7 (0)	8.7	3.5 (6.2)

Notes: The values in parenthesis indicate the impact on the respective category of farmers in case they are already paying metered tariff. The negative values imply reduced electricity bills; Assumed area irrigated, efficiency and other details as per Table 3. The highest and least values have been highlighted.

CALL FOR PAPERS

FRACTURED SOCIETIES, FRACTURED HISTORIES

A SUBALTERN STUDIES CONFERENCE

The broadening of democratic politics in India has been accompanied by the development of new concerns and assertions on behalf of hitherto subsumed and marginalised groups. These demands have made particularistic claims of a new kind which appear difficult to accommodate with existing institutional structures and ideas about the uniformity and unity of Indian state and society. Contentions of this new kind have often given rise to divergent ways of thought and of writing the histories of subaltern groups and their relationship with dominant classes.

The Sixth Subaltern Studies Conference, to be held at the Giri Institute of Development Studies, Lucknow in **January 1998**, will be concerned with these issues. The first part will be devoted to an examination of Hindu-Muslim difference and the idea of citizenship; the second part will debate the question of caste and national identity. Part of our concern here is to examine the gendered character of community and caste discourses in order to understand changing character of rights of sexes. Papers may address the themes of the conference in historical, theoretical and contemporary modes and may relate to the national, the regional or the local.

Papers written in both English and Hindi are welcome. The last date for submission of abstracts is **15 March 1997**. These may be sent to either Hiranmay Dhar, Giri Institute of Development Studies, Sector O, Aliganj Housing Scheme, Lucknow 226 024 or Partha Chatterjee, Centre for Studies in Social Sciences, 10 Lake Terrace, Calcutta - 700 029.

are high. The large co-operative LIS operating for 4,500 hours a year, consume 3,357 kWh/Hp/yr, hence effectively pay only Rs 0.09/kWh. The small (individual or group) LIS operate for lesser period. Considering an operating period between 1,500 to 3,000 hours a year, their effective tariff works out at Rs 0.26 to 0.13 per kWh.

The hours of operation of IPS on wells widely vary with the crop, the irrigated area, and the pump Hp. The usage of unmetered IPS on wells is estimated for different crops, based on the recommended water application. The pump usage is calculated for pumping water quantity equal to the recommended water use (shown in the Annexure), for the typical values of pumpset efficiency, water delivery head, and pump Hp.

Most wells have a 3 Hp or a 5 Hp pump. A total head of 10 meters and pump efficiency of 20 per cent has been considered for all IPS on wells. The calculation assumes two hector irrigation per well. Most irrigated crops are taken in combinations and in rotation. To simplify the analysis, only four major crops with the highest irrigated area in the state have been considered. These crops include sugarcane, summer groundnut, rabi wheat and rabi jowar. The average area irrigated per well in the state is about 1.25 ha [GoM 1995]. Hence, the calculation overestimates the pump usage hence underestimates the effective tariff. But the calculation neglects possible over-watering of some crops like sugarcane. In case of over-irrigation, the pump usage would be more and effective tariff paid would be lower than what is estimated here.

Table 2 shows the estimated electricity consumption, the electricity bill, and the effective tariff (in Rs/kWh) paid for irrigating different crops.

Farmers growing only rabi crops on well (usually jowar or wheat) under the flat tariff, and the quarter of users covered under metered tariff pay the maximum tariff, which is well over Rs 0.5/kWh. Wherever a well has abundant water, the farmer opts for more profitable crops, such as, sugarcane or summer groundnut. These farmers pay much less tariff. And the LIS users, usually growing water intensive crops pay even less, i.e., half to one-tenth of that paid by well irrigating farmers.

IMPACT OF TARIFF HIKE ON IPS USERS

As seen above, the present tariff favours farmers having access to abundant water. Consumption-based tariff is absolutely essential in order to make it more equitable as well as to create an incentive for efficient electricity use. Based on the above analysis of effective tariff paid, it can be concluded that LIS users will be the most affected if consumption-based tariff is applied. It is also essential to evaluate whether farmers can

Note: About 79 per cent farmers do not benefit from IPS subsidy. About 4.5 per cent farmers paying metered tariff, receive negligible (1 per cent). On the other hand, subsidy per beneficiary for large LIS is more than what would be needed to support a person for a full year on minimum wages. The third group, comprising the rest of unmetered consumers, received a subsidy of Rs 7,050 per IPS per year

afford to pay consumption-based tariff and whether any subsidy is essential. Hence, the present electricity bill as a share of gross value of produce has been analysed first; followed by analysis of the likely increase in electricity bills due to the tariff hike.

Typical electricity bills and typical 'gross value of produce' has been worked out in this section. Four major crops and two typical situations (the LIS and IPS on wells) have been considered for analysis. For IPS on wells, various combinations of pump Hp and crops have been considered. A typical cropping pattern on LIS has been assumed as mentioned earlier. Under the flat rate tariff, the electricity bill is directly proportional to the pump Hp irrespective of the pump usage. For estimating pump usage, the norm of pump Hp per ha irrigation found in case of 11 LIS has been assumed to be representative for LIS users. For IPS on wells, pump Hp per ha has been worked out for different combinations. The tariff of Rs 300/Hp/yr has been considered to be applicable. The gross value of produce per ha is calculated using the irrigated yields and the wholesale prices in the state (refer Annexure for data used).

For convenience of further calculation, the electricity consumption per ha of irrigation is also estimated. For IPS on wells, the electricity consumption as calculated in Table 2 has been used. For large LIS, electricity use has been calculated on the basis of assumed pump operation for 4,500 hours a year and pumping power of 1.8 Hp/ha irrigation.⁸ The gross value of produce (GVP), the pump Hp and consumption per ha is shown in Table 3. The electricity bill in Rs/ha/yr and as a percentage of the gross value of produce per ha is also shown in the table.

The cropping pattern and irrigated area per Hp for small LIS is not clearly known and hence, has been omitted from this analysis. But the IPS on wells and the large LIS are extreme cases and the small LIS is expected

to fall in between. The above calculation shows that, the present electricity bills are not too large. And there is no reason to pardon defaulting farmers. With flat tariff, the large LIS users and the cane producers pay the least, even as a percentage of value of their produce. And the less water and energy intensive users such as the jowar and rabi wheat growers pay the most. Since, the LIS users mostly grow water intensive cash crops, the present tariff benefits the cash crop growers, while being relatively harsh on foodgrain growers.

The impact on IPS users is analysis for two tariff levels; Rs 0.5/kWh (as recommended by NDC), and Rs 1.73/kWh (MSEB's average cost of generation and distribution in 1994-95). The likely electricity bills have been calculated using the estimate of electricity consumption per ha, as described earlier. For both tariff levels, the estimated electricity bill and the increase in burden, as a percentage of gross value of produce (GVP) has been shown in Table 4.

As seen in Table 4, for a tariff of Rs 0.5/kWh, farmers growing only rabi crops on wells will actually reduce their bills (if they have not opted for metered tariff already). A quarter of the IPS users that have already opted for metered tariff will see no change in their bills. Only farmers growing sugarcane on wells and LIS consumers will have to pay more. The increase in electricity bill will be only 1.7 per cent and 6 per cent of value of their produce respectively. This is definitely not an unbearable impact. This is the likely impact on the IPS users. The impact on average crop prices cannot be easily estimated. It is expected to be substantially less, as IPS irrigated crops form only a part of the total crop produce.

Some time ago, following NDC recommendation, a few SEBs attempted a move towards increasing the IPS tariff. A strong resistance from farmers for metered tariff of Rs 0.5/kWh, was reported. From

above table it can be seen that such a move would actually benefit or at least not harm the majority of farmers in the state. Only the LIS and cane growers would have to pay a little more. Paying Rs 0.5/kWh or even somewhat higher tariff should not be a problem for any category of farmers in normal situation. Actually, metered tariff would help in reducing the inequity in subsidy distribution. And opposition to metered tariff needs to be seen as an opposition to a move towards equitable distribution of subsidy.

At a tariff of Rs 1.73 (average cost of supply), the users with IPS on wells will need to pay 9 to 11 per cent of the GVP for electricity use. The large LIS will need to pay nearly a quarter of the GVP. Hence, it will be difficult for large LIS to pay cost-based tariff. This is especially true since these users also have to repay the bank loans. In other words the large LIS are unviable with cost-based tariff. But there are options to move closer to the cost-based tariff even for the LIS users. One such option is to give LIS users capital subsidy for improving pump and water distribution efficiencies, and help them improve their yields; while correspondingly increase the tariff. These investments in efficiency improvement by the SEB are sure to be highly cost effective. Additionally, LIS users can be charged a tariff increasing (in real terms) with the years of operation. The LIS users can afford to pay such increasing tariff because as time passes, their loan repayment decreases in real terms.

The miserable efficiency of the IPS and the economically attractive possibilities of increasing this efficiency is well known. In many field studies and pilot projects, economically attractive saving of around 40 to 50 per cent has been repeatedly demonstrated [Patel and Pandey 1993; NABARD 1984, Rajshekar, Mandi et al 1994]. Efficiency of the small and medium sized IPS is bad, because of improper choice of pump, piping and accessories, bad quality of pump and bad maintenance. In case of large pumps of LIS also, there exists scope for improvement, albeit smaller. For one LIS evaluated for efficiency improvement a saving of 12 per cent was found to be feasible by pump efficiency improvement. The water distribution losses in these LIS can also be minimised, usually by 10 per cent or so.

If we arbitrarily consider that electricity bill should be below 7 per cent of gross value of produce for all IPS users; then with efficiency improvement, users with IPS on well can easily pay the cost price of electricity. The large LIS users can pay over Rs 0.6/kWh. This assumes an average energy saving of 40 per cent in case of IPS on wells and 22 per cent in case of LIS.

But charging consumption-based higher tariff will not be sufficient to bring about the efficiency improvement. For example,

farmers using diesel pumps do pay equivalent to as much as Rs 3/kWh, but their efficiency is far below achievable or technically desired level (TERI 1994). The reasons for this are multifold and are not discussed here. The SEBs or the government will need to take substantial initiative to bring about the improvements. Even private capital and initiative can be utilised while minimising SEB's involvement. If the SEBs and the state governments are serious and ready to take innovative approach, the financial burden of the IPS sales can be substantially reduced, while distributing the subsidy more equitably.

In 1993-94 MSEB claimed the IPS consumption to be 8,922 million kWh and the average recovery to be only Rs 0.23/kWh [Planning Commission 1995]. If NDC recommended tariff (Rs 0.5/kWh) had been introduced, MSEB's income would have increased by Rs 240 crore. The energy intensive IPS consumers have a clear incentive to oppose metered tariff. But many IPS users would actually benefit from metering. Most of such users are simply not aware of the option of metered tariff or the likely benefits. Hence, opposition from most IPS users for metered tariff can be easily overcome. The objections by LIS users needs to be overruled for the reasons already mentioned.

But the SEBs are as reluctant to meter IPS consumption as much as the IPS consumers. The SEBs are said to be afraid that (i) the cost of metering/meter reading would be high and (ii) meters are unreliable and may not work properly. The argument of metering cost is evaluated first. In Maharashtra, the one time cost of installing meters on 14 lakh unmetered IPS will be about Rs 100 crore.⁹ The cost of meter reading is much smaller. Considering a cost of Rs 25 per reading and two meter readings per year, meter reading cost for all IPS will be only Rs 9 crore per year. Hence, the cost of metering is a baseless argument considering the expected increase in revenue of Rs 240 crore.

Second argument relates to the quality of the meters. The meter quality needs to be improved in any case and cannot be an argument against use of meters. But fortunately, for IPS users we have a simpler option. Once, a pump is installed, its power consumption is nearly fixed, which can be measured at the time of installation. The complicated energy meter can then be replaced by a simple timer which will monitor the hours of pump operation. Simple multiplication of pump power consumption (the measured power consumption or to begin with the pump name plate rating) with the hours of use will give the electricity consumption. Such electronic timers are simple, reliable and cheap. This method can improve the reliability and reduce the cost of installing new meters.

Such electronic timers can also include electronic circuits for (i) low voltage protection of motors, (ii) remote cut off for big IPS users and (iii) a current sensor to prevent use of higher sized pump than the declared size.¹⁰ The feature of motor protection will be a major incentive for farmers to install these meters. The remote shut-off will offer SEBs a tool to manage peak loads. The 3,200 large LIS in Maharashtra have a connected load of about 350 MW. These users can be cut off during emergency, to offer substantial relief to the grid without causing inconvenience to the domestic and other rural consumers. Economics of such remote cut off is highly favourable to addition of new capacity or transmission lines.

But most SEBs have another strong reason for their reluctance. This reason is never stated. The SEBs know that IPS consumption is lower than what they claim. It has been alleged by researchers as well as ex-officials in power sector, that SEBs dump T and D losses in IPS consumption, to show low T and D losses [Roy 1995]. Metering all IPS will expose high T and D losses, which are a sum of technical losses and commercial losses, such as theft. But for proper running of power utilities, this is all the more reason for metering all IPS.

Even if we ignore the benefits of more equitable subsidy distribution, reduction in water and electricity wastage, increased revenue to SEBs, etc, IPS metering is essential to monitor and ensure efficient running of SEBs. And it would be worth spending a few crores for that purpose alone.

Though the present study is based on sample cases, the qualitative conclusions are expected to be valid for Maharashtra. The conclusions may not be valid for other states. But considering that irrigated yields in Maharashtra are among the lowest in the country, the impact of IPS tariff hike will be more pronounced in Maharashtra. The major conclusions of the study are:

- The IPS tariff (which was in effect till June 1996) is not a large burden on any farmer in normal conditions and the defaulting farmers need not be protected. At the same time, a large number of farmers in drought prone area are not aware of option of metered tariff and end up paying high tariff, at times more than Rs 1.0/kWh.
- The flat tariff results in a highly iniquitous distribution of IPS subsidy. The relatively better off farmers, having access to abundant water and growing water intensive crops capture most of the subsidy. These users pay much less tariff (in Rs/kWh) and also pay much less in terms of share of their produce value, as compared to other IPS users. A shift to consumption-based tariff is essential to remedy the situation.
- The metered tariff of Rs 0.5/kWh would

not have large impact on any IPS users. And can be applied immediately. A somewhat higher tariff can also be considered.

- If the full cost of generation and distribution is planned to be recovered from users, then most farmers with IPS on wells can manage to pay the same with some difficulty. For them the increased burden will be 4 to 9 per cent of the value of produce. But for LIS users the added burden will be about 24 per cent of the value of produce. Which may not be affordable. And if such tariff is enforced, the LIS would be in serious trouble. However, with increased efficiency, a gradual tariff rise linked to years of operation is feasible.
- The impact of consumption-based tariff will be mostly seen on cane and other water intensive crops with very small impact on cereals and other food crops.
- Efficiency improvement of IPS can substantially improve farmers paying capacity (in terms of Rs/kWh). Most farmers can pay the cost-based tariff without major change in their costs. If SEBs take proper initiative, efficiency improvement can be achieved through private sector investment while benefiting the SEBs.
- Metering of IPS is not just feasible, but is also highly desirable for social equity, reduction of water and electricity wastage and more importantly for monitoring and improving the efficiency of SEBs.

ANNEXURE

The major irrigated crops in the state are sugarcane, rabi jawar, rabi wheat, and summer groundnut [GoM 1995]. These crops are also important from IPS power consumption point of view. The recommended water application, and the typical yield on irrigated fields in the state are given in table below. Table also shows gross value of produce per ha for the said yield.

RECOMMENDED WATER APPLICATION,
AVERAGE YIELDS AND GROSS VALUE FOR
MAJOR CROPS

Crops	Recommended Water Application (Ha-cm)	Yield (Kg/Ha)	Gross Value of Produce (Rs/Ha)
Sugarcane	274	83,000	66,400
Summer groundnut	91	1,382	20,730
Rabi wheat	46	1,820	10,738
Rabi Jawar	30	1,446	8,673

- Notes
- 1 Irrigation water needs at field head, in lift irrigation schemes as quoted in Rath and Mitra 1989: 21.
 - 2 Yields of crop cutting experiments as per 'Performance Budget Irrigation Department' [GoI 1994].
 - 3 Gross value of produce based on 1995 wholesale prices in Maharashtra [GoI 1995].

Notes

[The authors would like to thank Sulabha Bramhe and A K N Reddy for inspiring us to work on this issue. Comments of Bramhe, Ashok Mitra and Nilkanth Rath on the earlier drafts were extremely valuable. This work was a part of the PRAYAS project on 'Water-Energy Nexus', funded by International Energy Initiatives, Bangalore.]

- 1 Shift to consumption-based tariffs has been assumed due to its multiple benefits.
- 2 $\text{Rs } 90/\text{Hp/yr} = 241 \text{ Hr/yr} \times 0.746 \text{ kWh/Hp} \times \text{Rs } 0.5/\text{kWh}$
- 3 Since July 1, 1996, MSEB has revised IPS tariff for Hp-based billing. As per the new tariff, high tension users (large pumps, mostly large LIS) pay Rs 600/Hp/yr. The marginal farmers can avail of the concessional tariff of Rs 500 Hp/yr. The metered tariff was not changed.
- 4 For metered users with connected load more than 10 Hp the minimum tariff was Rs 120/Hp/yr, while, for smaller pumps it was Rs 90/Hp/yr. Hence, an average of Rs 100/Hp/yr is considered for analysis.
- 5 This analysis ignores the shortfall in recovery from IPS users. The shortfall was significant averaging over 30 per cent of billed amount for last few years. The analysis also assumes that MSEB's claim about the electricity use by IPS consumers is correct.
- 6 The connected load of the large LIS is not documented by MSEB or any other government agency. This has been estimated based on their irrigated area and the norm of 'kW/ha' which was derived from the data of 11 large LIS cases. The design irrigation area (irrigation potential) and membership of LIS co-operatives is much larger than actual area irrigated or persons benefiting. The beneficiary families were estimated using the norm of average landholding in the 11 sample LIS, which was 1.32 Ha per beneficiary (the average landholding in the state in 1991 was 2.2 ha, as per the *Economic Survey of Maharashtra*, 1993-94).
- 7 There is discrepancy in the billed amount estimated in Table 1 and the actual billed amount by MSEB (as per the information available from MSEB). The estimates here are based on the connected load of unmetered IPS, the consumption of metered users, and the applicable tariffs (all data from MSEB annual report). This discrepancy of about 9 per cent may be due to the fact that MSEB reports the number and load of electrified IPS, without accounting for disconnected IPS.
- 8 The norm of 1.8 Hp/ha was found in case of 3 LIS analysed. For large LIS, with a static head of 50 meters, the said cropping pattern, pump capacity of 1.8 Hp/ha and pump operation of 4,500 hours/year, corresponds to overall pumping efficiency of 49 per cent with a water distribution loss of 25 per cent. These efficiencies are close to representative values.
- 9 Considering cost of meter, installation charges, etc., at Rs 750 per meter.
- 10 Some pump manufacturers do offer pumps with power consumption higher than the name plate rating.

Oxfam, is seeking to recruit a Programme Coordinator to work with local voluntary agencies and rural groups/institutions to assist both them and forest users/dwellers to participate in the Western Ghats Development Project. Focus will be on strengthening and building on **Oxfam's** work in the region over the last 3 years, which will include continued interaction with village level groups and other organisations involved in the programme. (This will be in the form of training, planning, documentation and where necessary, funding.) The Coordinator will also need to effectively liaise with voluntary organisations and Forest Department officials.

This is a challenging post and **Oxfam** is looking for a person with a minimum of 3 years of experience in community organisation work particularly at the grassroots level. Experience of micro planning in relation to natural resource use and/or of forest related issues and work is desirable but not essential. Strong social and interpersonal skills are required along with sensitivity to gender issues and a commitment to ensure women fully participate in and benefit from development programmes. A good working knowledge of Kannada/ Marathi and English is essential. The Coordinator who will be located at Sirsi, Uttara Kannada District, Karnataka (with possible relocation to Hyderabad) will have to largely work independently. The position requires considerable travel.

We offer a 3-year contract and reasonable salary and other benefits to attract competent professionals. Women candidates are especially encouraged to apply. Only shortlisted candidates will be contacted for interviews.

Apply with full CV and a covering letter explaining fully from your experience how you meet the criteria listed not later than 31st December 1996. Applications should be sent to **Oxfam (India) Trust**, 3/19, Shiva Arun Colony, West Marredpally, Secunderabad - 500 026. We do not encourage enquiries over phone or in person.

Towards National-Popular Notes on Self-Respecters' Tamil

M S S Pandian

This article intends to free the language question in Tamil Nadu from the stigma of being dubbed 'anti-national' in the nationalist narrative, and make available alternative ways of imagining politics based on the national-popular will. The article cites the anti-Hindi agitation launched by the Self-Respect Movement in 1937 as a movement where national-popular will found its articulation in mobilising a spectrum of subalternities in support of Tamil.

The vernaculars are written down when the people regain importance. [Gramsci 1985:168]

I Introduction

IN the pan-Indian national imagination, Tamil Nadu often figures as a space of 'linguistic insubordination'. Among other things, the continued resistance of the region to the imposition of Hindi, which began as early as the 1930s, as well as forms of protest associated with such resistance like self-immolation (which till the anti-Mandal agitation carried the quality of the 'unfamiliar'), are some of the factors which have contributed towards such an imagination.

Within the framework of nationalist narratives, this 'linguistic insubordination' of Tamil Nadu gets written as 'chauvinistic', 'fissiparous' and 'divisive'. For instance, when Jawaharlal Nehru, as the prime minister of India, spoke against the call by the Dravida Munnetra Kazhagam during the late 1950s against Hindi, he was full of anxiety about the so-called national unity: "Mr Nehru warned that the campaign of disunity was doing injury to the country and harming the progress of Madras state. He appealed to the Tamil people not to follow this unhappy path which would destroy them. They should instead work for the building up of a strong united, progressive and prosperous India" [Ramanujam 1967:47]. Similarly, T N Seshan's controversial biography refers to the anti-Hindi agitation of 1965 as "a fissiparous agitation in the name of language" [Kutty 1994:85]. The ontological primacy given to 'nation' in such narratives invests the language issue with a singular connotation, i.e. as against the nation, and denies its other possible connotations. Importantly, this containment of meaning makes the language issue available for correction by the homogenising nation-state.

Within this broad context, the present set of notes has a limited agenda: it intends to free the language question in Tamil Nadu from its nationalist reading and to recover the surplus of connotations which are refused within such a reading. This is done through a recounting of the pre-1947 career of the

language debate in the Tamil-speaking region. In doing so, I argue that 'Tamil' emerged within the discursive field of the early Dravidian movement as a site for a 'national-popular' project by encompassing a range of democratic concerns connected with caste, gender and region, and involving different subaltern groups.¹ In other words, in the early Dravidian movement's engagement, the language issue attempted to break the people-intellectual separation which was affirmed by the brahmin orthodoxy in Tamil Nadu through Sanskrit, the sacerdotal language, and English, the language of colonial governance. This disarticulation between the intellectuals and the people/nation, which was contested by the Dravidian movement by privileging a refashioned Tamil, stood against the possibility of the 'national-popular'.

II Sanskrit, English and Brahmin Hegemony²

Though the brahmins constituted only a little over 3 per cent of the total population in the Madras Presidency, their control over the Madras administration in terms of high-paid jobs with substantial bureaucratic authority was almost monopolistic [Suntharalingam 1980:123; Arooran 1980:38; Irschick 1969:13-16, 42]. However, what was at issue in the Tamil political context was not merely their excessive control over the colonial structures of authority; but, more importantly, their stubborn refusal to constitute a modern subjectivity for themselves in the new context: "The upper castes, especially the brahmins found that their intelligence and application brought them rich rewards but at the same time did not entail any obligation which would run counter to their traditional ways of living. They could live comfortably in two worlds, the secularised, modernised atmosphere of their places of work which did not affect their everyday domestic and social life. The law along with teaching and civil service were professions which they could well adopt and yet not infringe their caste or ritual prohibitions" [Srinivasan 1970:184]. In other words, the Janus-faced existence of the brahmin meant that he now combined his

pre-existing hegemony in the indigenous society exercised through caste and religion, with his new-found authority in the colonial 'political society' – each spilling into the other. This tightly-woven configuration of power in the hands of the brahmin was a legitimate moment of anxiety for others; and it came out in all its sharpness during the controversy surrounding the elevation of Muthuswamy Iyer to a judgeship at the Madras high court.³ When 'A Dravidian correspondent', contesting the appointment of Iyer, argued in the columns of *Madras Mail* (September 5, 1878) that the brahmin was "least fitted of all castes to deal fairly with the masses... since he considers himself as a god and all others as Mlechhas" [Suntharalingam 1980:153], he was not only questioning the appointment *per se*, but also the new coalescence of different domains of authority in the brahmin under colonialism.

Intimately linked to the hegemonic location of the brahmin both in the pre-existing indigenous sphere and the colonial political society was his bilinguality. This bilinguality was distinguished by its contempt for Tamil, the language of the masses, and its simultaneous enthusiasm for English and Sanskrit, both languages of exclusion, and hence, of power: "They spoke a colloquial Tamil brahmin dialect, a slang, at home; and impeccable English in office and from public fora; they praised Sanskrit and learnt enough to make a local show of it. They disdained to speak in their mother tongue on public occasions and never felt ashamed to admit that they could not express themselves sufficiently well in Tamil. Some of them became noted great orators in English but none of them could speak a single sentence in Tamil without using a high percentage of English words or loading it with a still higher percentage of Sanskrit. They know the Sanskrit lore, became soaked in western intellectual tradition but remained totally ignorant of Tamil literary and cultural traditions" [Subramaniam 1989:94]. The reason for this particular kind of bilinguality of the brahmin is not far to seek. While English facilitated his access to and authority in the colonial 'political society', Sanskrit, which was celebrated as 'Deva Bhasha' or the language of the celestials, reinforced his hegemony in the indigenous society.

If access to authority was the meaning of this bilinguality for the brahmin, it simultaneously meant exclusion and disempowerment for the Tamil-speaking monolingual subaltern. For instance, Gnanambal, the woman protagonist of *Pradhabha Muthalar Charitram*, which is credited to be the first Tamil novel, talks in *extenso* of the implications of conducting court proceedings in English for the ordinary Tamilian; and concludes, "They return back home without any gain like a blind man who went to watch theatre and like a deaf man who went to listen to music" [Vedanayagam Pillai 1984:302].¹ Being ideologically constituted as the embodiment of brahminical Hinduness,² the exclusion based on Sanskrit was more intense and overlaid with the politics of caste. Sanskrit schools, both government-funded as well as those supported by temple endowments, denied by and large admission to non-brahmin students [Varadarajulu Naidu 1991:21-22; Thirunavukarasu 1991:69-72]. The brahmin orthodoxy, in affirming the sacerdotal status of Sanskrit, simultaneously inferiorised Tamil. Their resistance to conducting Temple 'archanas' in Tamil [Harrison 1960:130-31]³ and their claim that Tamil language and literature were mere derivatives of Sanskrit, an argument which goes back at least to Subramania Dikshitar of 17th century [Thirumaran 1992:80] were some of the modes through which the brahmins affirmed the sacerdotal quality of Sanskrit and at once, inferiorised Tamil. As recently as early 1940s, when Thandapani Desikar sang in Tamil during the Tiruvayamur music festival, the next singer, a brahmin, refused to sing unless the dais was purified with water and cowdung. And of course, the dais was purified to facilitate his singing.

With the arrival of Indian nationalism, which privileged in more than one way the subject position of the upper caste Hindu male, Sanskrit acquired a new connotation and became the sign of Indianness. Theosophical Society started Sanskrit schools in Madras city as well as in other parts of the presidency such as Madurai, Bellary, Nellore, Vizianagaram, Trichinopoly and Guntur, and in founding the Adayar Oriental Library, it attempted a 'national Sanskrit movement' [Suntharalingam 1980:303]. What began under Col H S Olcott in the late 19th century, continued with new vigour under Annie Besant through the early 20th century [Arooran 1980:46], and earned her the dubious appellation 'Irish Brahmani'.

In this new context of nationalism, brahmin nationalist leaders extolled the virtues of Sanskrit, unmindful of its exclusionary dynamics. For instance, P S Sivasamy Iyer, in his convocation address to the University of Madras in 1914, lent his able oratory for

the cause of Sanskrit thus:

If, in the opinion of the most cultivated and thoughtful mind of Europe, the classics have an important place in a scheme of liberal culture, is it too much for claim a place of at least equal prominence to Sanskrit, a language which for flexibility as an instrument of thought and for vocal charm may challenge comparison with any in the world, and can boast of literature containing precious treasures of thought, imagination, beauty and wisdom. As the language which enshrines the highest ideas of Indo-Aryan civilisation, as the language in which the highest achievement of the Hindu mind in the region of philosophic speculation and religion have been recorded, as the language to which most of what is in the vernacular literatures of India owes its inspiration, and as the language in which the ordinances that regulate our social life and institutions to this day have been written, a knowledge of it is an essential element of culture to every Hindu. (New India, November 19, 1914)

We need to bear in mind here that Sivasamy Iyer was addressing a convocation of the Madras University and not an audience owing allegiance to Sanskrit Hinduism. His reference to "our social life" did no doubt exclude all those in the audience whose religion was non-Sanskritic Hinduism or non-Hinduism. As much as Sivasamy Iyer, other nationalists such as S Satyamurthy and C Rajagopalachari too held similar opinion about Sanskrit. For Satyamurthy, Sanskrit gave "a true culture, a real intellectual pleasure and a disciplined mind" [Arooran 1980:99n]; and for Rajagopalachari, Sanskrit is necessary for 'cultural perfection' [Bharati 1937:11]. Interestingly, *Eminent Orientalists: Indian, European, American*, an edited volume brought out by the well known nationalist publisher from Madras, G A Natesan, carried accounts of 25 orientalist scholars including William Jones, Henry H Colebrook, Monier Williams, Max Muller and Paul Deussen, and it ignored totally all those who worked for the revival of Tamil such as Peter Percival, Winlow, G U Pope and Robert Caldwell!⁷

In short, the bilinguality of the brahmin in colonial Tamil Nadu, particularly his valorisation of Sanskrit, was marked by the logic of exclusion, an exclusion which, in Gramscian terms, meant the unconnectedness of the intellectuals with the people/nation. In fact, the scenario was rather similar to what Gramsci wrote of the Italian intellectuals of the 1930s:

In Italy the term 'national' has an ideologically very restricted meaning, and does not in any case coincide with 'popular' because in Italy the intellectuals are distant from the people, i.e. from the 'nation'. They are tied instead to a caste tradition that has never been broken by a strong popular or national political movement from below... The current term

'national' is connected in Italy to this intellectual and bookish tradition. Hence the foolish and ultimately dangerous facility of calling 'anti-national' whoever does not have this archaeological and moth-eaten conception of the country's interest [Gramsci 1985:208].

III Nationalism and Incomplete Appropriation of Tamil

With Indian nationalism entering its mass-mobilisation phase during the 1910s, the leadership of the Tamil Nadu Congress, though dominated by the brahmins, could not shut out Tamil fully. The need to appropriate Tamil for the cause of nationalism was accentuated, in addition, by the arrival of the non-brahmin movement in the form of the Justice Party in 1916. Significantly, the decisions to fight the Justice Party and to employ Tamil for nationalist propaganda were taken together by the Congress leadership. As P Varadarajulu Naidu recounted the story,

It was in August 1916 that Dr T S S Rajan, the late Mr V O Chidambaram Pillai, Mr C Rajagopalachariar and myself, met at the residence of Mr Rajagopalachariar at Salem. After discussing the then political and communal [an allusion to the politics of the Justice Party] situation in South India for over three hours between 9 and 12 O'clock in the night, we decided to stand together... The outcome of our midnight and historic meeting was the formation of the Madras Presidency Association in 1917 to fight the Justice Party, the campaign against Dr Annie Besant and the first attempt made to carry on political propaganda in the Tamil language [Anonymous 1948:6].

Though both the brahmins and the non-brahmins in the Congress leadership participated in this project of employing Tamil for nationalist mobilisation, it was the non-brahmins who showed greater enthusiasm. During the Home Rule Movement, Varadarajulu Naidu declared, "I have felt that for the national uplift and the attainment of real and enduring Home Rule in India, the political concepts, aims and methods of work which have hitherto been the exclusive possession of English educated people should be brought within the familiar reach of people at large, through the medium of their mother tongue" [Irsechiek 1969:306]. Similarly, in 1919, S Somasundara Bharati got a resolution passed in a Congress meeting that speeches at political meetings should be made in Tamil instead of in English. There was a number of other non-brahmin leaders who were part of this Tamil-enthusiast nationalist band; while Thiru Vi Kalyanasundara Mudaliar radicalised Tamil journalism through *Desabhaktan* and *Navasakthi*, V O Chidambaram Pillai of

Swadeshi Movement fame, was an equally important figure in this respect.

In contrast, the brahmin leaders of the Tamil Nadu Congress, even while instrumentally using Tamil for political mobilisation, refused to let go their attachment to Sanskrit. While S Satyamurthy and V V S Iyer used a hybrid Tamil with lots of Sanskrit words (which had Tamil equivalents in popular usage), the brahmin-run nationalist daily *Swadeshamitran* (unlike Thiru Vi Kalyanasundar Mudaliar's *Desabhaktan*) employed a large number of Sanskrit and English words [Diraviyam 1974:120, 141-43, 146]. Satyamurthy went to the extent of defending his hybrid Tamil as the most effective political language. More importantly, this refusal to abandon Sanskrit manifested acutely during critical junctures like the debate on the coining of scientific terms in Tamil. In such contexts, they stood on the side of Sanskrit [Irschick 1969:305; Nuhman 1985:158]. In other words, though the Indian nationalism's need to mobilise the masses by employing their mother tongue did create breaches in the boundary between brahmin/Sanskrit and non-brahmin/Tamil binary, such breaches were insufficient to erase the old divide.

Perhaps an interesting illustration of this continuing divide between the brahmins and the non-brahmins on the language issue would be the encounter between Subramania Bharati and V O Chidambaram Pillai. While Bharati argued that Tamil script should include new symbols to enable foreign names to be written in their original form, Chidambaram Pillai posed, "Everyone of those who have thus far proposed the reform of Tamil script has some link or the other with Sanskrit and why they have not proposed similar reforms in the script for Sanskrit" [Venkatachalapathy 1996:141]. While both were part of the nationalist formation in Tamil Nadu and showed great passion for Tamil, Bharati was a brahmin and Chidambaram Pillai, a non-brahmin.

Strikingly, a number of these non-brahmin Tamil enthusiasts within the Congress got estranged with Congressite nationalism either on the question of caste or language – both of which, as we have seen, were closely linked in the Tamil context. Varadarajulu Naidu left the Congress in 1928 protesting against the separate dining arrangements for the brahmin and non-brahmin students practised in the Seranmadevi Gurukulam, a national school partly funded by the Congress. Somasundara Bharati joined the anti-Hindi agitation of the late 1930s opposing Rajagopalachari's decision to introduce Hindi in schools. Thiru Vi Kalyanasundara Mudaliar aligned himself with the non-brahmin movement on an anti-Hindi platform in the 1940s. Chidambaram Pillai, during his last days,

left the Congress and joined the non-brahmin movement.

IV Reinscribing Tamil: Towards 'National-Popular'

The Self-Respect Movement, which was formed as part of the revolt against the Indian National Congress's unwillingness to address the issue of caste-based oppression in the Tamil region, took a self-consciously active role in problematising the exclusionary politics of Sanskrit.⁸ The founder of the Self-Respect Movement, E V Ramasamy (who interestingly carried the appellation of an anti-national all through his non-Congress career) and his close associates like Kootusi Guruswamy engaged themselves in a sustained critique of Sanskrit's claim to superior forms of knowledge/culture.

This critique primarily proceeded from a rational-utilitarian premise of what different languages are capable of in negotiating the current situation of powerlessness which marked the social life of the Tamil masses. In 1939, when Hindi was a burning issue in the Tamil-speaking region, E V Ramasamy outlined his stance on language question thus:

I do not have any attachment to the Tamil language for [the reason] that it is my mother tongue or the tongue of the nation. I am not attached to it for [the reason] that it is a separate language, ancient language, language spoken by Shiva [or] language created by Agastiyar. I do not have attachment for anything in itself. That will be foolish attachment, foolish adulation. I may have attachment [for something] for its qualities and the benefits such qualities will result in. I don't praise something because it is my language, my nation, my religion... If I think my nation is unhelpful for my ideal and cannot [also] be made helpful, I will abandon [it] immediately. Likewise, if I think my language will not benefit my ideals or [will not help] my people to progress [and] live in honour, I will abandon it.. [Chidambaranar 1983:214]

Within this framework of reasoning, Sanskrit emerged as a language which denied equality, honour and progress to the subaltern sections of the Tamils – lower castes, women, working people and so on.

One of the central concerns of the Self-Respect Movement's engagement with language question was, of course, caste. In tracing the link between Sanskrit, caste and brahminic Hinduism, E V Ramasamy, for example, queried, "Let us have a look at the harm already done to and will be done to us because of Tamil's association with Sanskrit. Let us take the problem of caste among us. If the Sanskrit word 'jati' is removed from Tamil language, is there any equivalent Tamil word for it. Let the [Tamil]

pandits answer. Alas! No word! It is clear that there was no caste system among our people in the ancient days; and it emerged [among us] due to our association with the north. Similarly, [take the example of] words such as 'Divasam', 'Kalyanam', 'Vaikundam', 'Swargam', 'Moksham', 'Naragam', 'Sloka', 'Swaruba'.... Aren't they Sanskrit words? Are they Tamil words? Have we got enlightened because of these words? Or, have we lost our power of reasoning?... [Anaimuthu 1974:11, 969]. In other words, the Self-Respect Movement inverted the brahmin/nationalist construction of Sanskrit as a sign of superior culture and reinscribed it as a field of cultural production introducing and legitimising inequalities based on Hinduism and its caste system.

In popularising this non-elite reading of Sanskrit among the broad masses, the movement, among other things, set aflame in public Sanskritic texts which endorsed caste, particularly *Manusmriti*. Expectedly, it led to much despair among the brahmin nationalists; and Rajagopalachari, for instance, referred to such book-burning as "suicidal crusade against the language, literature, the customs and the sacred books of Sanskrit" [Irschick 1969:339]. Importantly, such campaign did succeed in creating a broad consensus among the non-brahmin intelligentsia in Tamil Nadu about the connectedness of Sanskrit with caste-based oppression. Most of the pamphlets brought out during the anti-Hindi agitation of the late 1930s repeatedly referred to such a connection. As one of these pamphlets recounted the argument, "'Hindu' 'Mitham' [religion] – these two words are Sanskrit words... It is the ignorance of the Tamil people that they call it [Hinduism] their religion... It is this religion that created jati in Tamil Nadu which knew no caste system. It is because Tamilians allowed Sanskrit to influence their lives and fell prey to Hindu religion and superstitious beliefs, they lost their self respect and became [like] beasts..." [Selvarajan, nd:25].

For the Self-Respect Movement, Sanskrit not merely led to the degradation of lower castes, but also of women. Here, the movement targeted for criticism the Sanskritic marriage customs which affirmed women's subordination. As E V Ramasamy argued,

Only with the arrival of words such as *Thura Mukurtham* and *Kanniga Dhanam*, our women became puppets of their husbands. Only after [the arrival of such words], we landed up with such fathers who advise their daughters, who return after some quarrel with their husbands, that they had been gifted away to their husband and they belong to his place. Can you find an equivalent word for *Kanniga Dhanam* in Tamil? Thiruvalluvar

called it as *Vazhkkai Thunai* [life partnership]. It only means that husband and wife are friends. What a vast difference in thought... At least, is there a Tamil equivalent for *Putivrattha*? This is also a harmful result of our association with Sanskrit. [Aanaimuthu 1974:II, 969-70]

Similarly, in the course of the anti-Hindi propaganda in 1948, he despaired, "How much one had struggled to change *Kanniga Dhanam* into *Vazhkkai Thunai Oppantham* [contract of life partnership]? How much trouble one was faced with in erasing the word *Mangalya Dharanam*?" (Indi Pour Murasu, 1948:16-17). In keeping with this critique, activists of the movement like Moovalur Ramimamirtham Annimiyar used to translate Sanskrit slokas into Tamil during self-respect marriages and elaborate how they embodied and reinforced women's subordination to men [Thirunavukkarasu 1991:171].⁹

The third moment of Self-Respect Movement's critique of Sanskrit was related to the devalued representation of south as a region in Sanskrit texts. Here, *Ramayana* was reread and interpreted as a text celebrating northern imperialism. Harrison (1960:127-28) sums up rather pointedly this campaign against *Ramayana* by the Dravidian Movement thus:

The Dravidian argument is based on the very substance of Hindu mythology, and *The Ramayana*, so proudly hailed as a force of synthesis, becomes the basic text cited to establish Aryan inequity. In Dravidian propaganda the southward march of Rama to the lair of evil King Ravana, abductor of Sita, is nothing less than the allegorical story of the triumphal Aryan progress over the original inhabitants of India. To many a non-brahmin Tamil, the legions of monkeys Rama encountered in the southern jungles appear to be none other than the Dravidians... The Dravidian movement rewrites *The Ramayana* to cast Ravana as a Dravidian hero repelling Rama, the invading Aryan generalissimo. Touring dramatic troupes parody the epic... When Rajagopalachari, a brahmin, was chief minister of Madras in 1954, he ordered police to search out the troupes, which were forced to perform in clandestine gatherings, and even took to the All-India Radio to mobilise a 'Ramayana Protection Committee'.¹⁰

The campaign did not even spare the Tamil version of *Ramayana* written by Kambar. Addressing those who defend *Kamba Ramayanam* on the basis of its aesthetic merits, E V Ramasamy noted, "They say [*Kamba Ramayanam*] is a rare literature. What is the use? However starved one is, would one pick up food from shit...How can anyone who desire self-respect read *Ramayana*?" [Aanaimuthu 1974:II, 977].

If the Self-Respect Movement's critique of Sanskrit disinvested it of its claim to superiority and recast it as a vehicle for

multiple forms of disempowerment, it read English as a language of modernity rather than as one of colonial governance. In defence of English, E V Ramasamy claimed, "We learn about the means to improve our lives from books written in English. In short, it is no exaggeration to say that it is the knowledge of English which kindled the spirit of freedom in our people who had been cherishing enslaved lives. It is English which gave us the knowledge to say 'no' to monarchy and 'yes' to republic; to say 'yes' to socialism and 'no' to *Sanathanam*. It gave us the knowledge that men and women are equals..." [Aanaimuthu 1974:II, 970-1]. He continued, "It is not our Tamil or Sanskrit which came to destroy it, but it is English, which gave us telegraph, electricity, cinema, aircraft, radio and X-ray. Sanskrit enslaved our reason through the superstitions of Shastras, Puranas and Itihasas. English freed us from such chains of bondage and made us think on the basis of rationality..." (Ibid:971).

In other words, while English functioned as a form of cultural capital and an instrument to access bureaucratic authority for the upper caste, particularly brahmin, elite, it had a different connotation in the discourse of the Self-Respect Movement. For the movement, it is a carrier of enabling ideas which could be mobilised to interrogate the pre-existing arrangement of power in the Tamil society and to recover a space for subaltern assertion. Such a reading of English was greatly facilitated by the location of the Self-Respect Movement in the Tamil political milieu as not circumscribed by mere anti-colonialism.

Let us now turn to the manner in which the Self-Respect Movement engaged with Tamil. Significantly, the movement did not view the opposition between Sanskrit and Tamil as a pure, absolute opposition. Though Tamil as an embodiment of social relations was better than Sanskrit, it required refashioning so as to free it from a range of social exclusions and disempowering implications inherent in its current form, i.e., refashioning Tamil was part of the movement's agenda to negotiate multiple forms of disempowerment faced by the Tamil subaltern classes.

Towards such an agenda, the movement strived hard to dissociate Tamil from its fossilised historicity. In 1943, when separate Dravida Nadu was very much on the agenda of E V Ramasamy, he wrote, "The unnecessary ancient principles of the Tamils...have become useful [only] for deceiving outsiders and plunging [oneself] into foolishness. It has become the duty of the rationalist that such talk [about ancient Tamil ideas] should not be evoked for any reform from now on." He proceeded further: "If several of our 'pundits' do not have rational thinking, it is because of the

obscurantism of the ancient Tamil principles. There is nothing at present to be achieved by the talk of ancient Tamils. Therefore it is an important duty of the people not to give any place for such fraudulent speech..." [Aanaimuthu 1974:II, 1251-52]. A striking illustration of E V Ramasamy's contempt for the Tamil past could be his reaction to the glorification of ancient Tamil women by the leaders of the anti-Hindi agitation of the late 1930s. He intervened to tell them: "It will be worth-while if you discuss the present status of women and what can be done about achieving women's freedom, instead of glorifying our grandmothers like Allirani, Kannagi and Madhavi" (*Kudi Arasu*, November 27, 1938).

Thus locating the role of Tamil in the anticipatory, the movement developed a critique of Tamil as embodying retrogressive cultural practices in the present. The cultural practices which drew the utmost attention of the movement were related to religion and gender. The propagandists of the Self-Respect Movement entered into bitter conflicts with the non-brahmin Saivite elites who promoted Tamil as the language of Saivism and Saivite culture as well as with the Tamil pundits who taught the language through the medium of religious texts. Kuthoosi Guruswamy, for instance, critiquing the Tamil pundits, noted, "...They are obsessed with Tamil purism. Other than that, they only know how to teach Tamil literature through Puranas. For instance, while explaining *Kamba Ramayanam*, they teach that Rama is an incarnation of Maha Vishnu, Sita is the incarnation of Goddess Lakshmi, and Hanuman could lift an entire mountain; and that it is sinful not to believe in all these. On listening to this, can any student understand and enjoy the literary merits of Kambar? Instead the students spend their time worshipping Rama and seeking his blessings" [*Pruthuvai Murasu*, October 26, 1931, cited in Velu and Selvaraju 1989:10]. Towards desacralising Tamil, the Self-Respect Movement campaigned against the singing of Saivite hymns in Tamil conferences, teaching religious texts as part of Tamil language courses and carrying invocations to god in textbooks [Velu and Selvaraju 1989]. While the movement encouraged Tamil music, it opposed singing of bhajans in Tamil. Ridiculing the singing of bhajans in Tamil as part of the Tamil music movement, E V Ramasamy commented, "What [good of] bhajans whether they are in Tamil, Telugu, Hindi, Japanese or German. After all, which language god does not know" [Kesan 1991:48].

In a similar fashion, the self-respecters criticised Tamil as a bearer of gender inequalities. *Thinukkural* and *Silapathikaram*, two important classical Tamil texts, came in for barbed criticism for they degraded women and denied them equality with men.

E V Ramasamy characterised *Silapathikaram* as a text "which began in prostitution, grew in 'chastity' and ended up in foolishness and superstition". We may note here that chastity, for him, signified women's unfreedom. Similarly, despite his qualified approval of *Thirukkural*, he subjected it to severe criticism for emphasising women's subordination by glorifying chastity. He noted with contempt that Tamil did not have words for the male counterpart of adulterous and widow. He invented the neologisms *vidavan* for widower and *vibacharan* for those men who visit prostitutes, and suggested their popular use. He also noted that several Tamil words such as *Aaninai* (masculinity) were derogatory to women:

Women should not forget that the word *aanmai* itself is used in derogation to women... As long as *aanmai* will exist, women's slavery will only grow. It is definite that the emancipation of women will not materialise till women themselves destroy the philosophy of *aanmai*. Freedom, valour and such qualities are made the right of men. Men have decided that these [qualities] belong only to *aanmai*.¹¹

Let me now quickly sum up the important points which emerge out of the foregoing account of Self-Respect Movement's engagement with the question of language. First of all, it bared open the exclusionary politics of Sanskrit and its disempowering implications for the lower castes and women. Second, it tried to refashion Tamil as an inclusive cultural field. Finally, this inclusivity was premised on multiple contestations against different forms of oppression based on caste, gender, religion and region.

V

1937: Signs of the 'National-Popular'

The decade-long propaganda by the Self-Respect Movement in recasting the language issue as a site for disempowered social groups to articulate their politics of emancipation, showed signs of success in 1937. As is well known, in 1937 the Congress ministry headed by C Rajagopalachari introduced compulsory study of Hindi in schools in the Madras presidency. Though Hindi was presented as the national language, its introduction in schools was defended by the Congress leadership in terms of its closeness to Sanskrit and the possibility of having access to northern Hindu religious texts. Rajagopalachari claimed that Hindi would, among other things, help in learning Sanskrit and reading Tulsi Ramayana. The brahmin-controlled press too used the occasion to plead for Sanskrit. For instance, *Ananda Vikatan* (October 17, 1937) not only defended the introduction of Hindi in schools, but also asked the government to introduce Sanskrit

in higher classes as an optional course [Ramasamy 1974:2]. The agitation launched by the Self-Respect Movement against Hindi continued from 1937 to 1940 and finally succeeded in evicting it from schools.

As we have noted elsewhere in the paper, a large number of anti-Hindi pamphlets published during the agitation, though most often not by self-respecters themselves, spoke of the connection between caste and Sanskrit as well as the degrading marriage rituals brought in by Sanskrit Hinduism. Surely these are signs of Self-Respect Movement's stance on language gaining the quality of common sense. Also the agitation drew large numbers of people. While an anti-Hindi meeting in Madras held on June 26, 1938 witnessed a gathering of 50,000 people, a similar meeting in Viruthunagar held on July 10, 1938 attracted 10,000 people. About 5,00,000 people in total participated in 87 such meetings organised in the mofussil areas of Tamil Nadu [Kesavan 1991: 66]. Significantly, a large number of the participants in the agitation were drawn from the subaltern stratas of the Tamils, thus adding a national-popular character to it. Among other things, the presidency magistrate's reason for denying rice diet to the anti-Hindi prisoners brings out this fact candidly. As he noted,

It is a fact that rice diet was refused to picketers who were sentenced. It was clear after a series of batches of picketers were enquired that they were persons having no ostensible means of livelihood and they were being seduced to go over to Madras to commit acts in violation of law and then prefer to go to jail. Even though in every case there was an offer made to them by me to release them under section 562 Cr P.C., in order that they may attend to their normal avocations, they refused to execute bonds and preferred to go to jail and when sentenced batch after batch had only one request to make, viz, that they wanted rice diet. It looked as if they had been sent with the hope that they would be given rice diet and that the inconvenience to them was less compared with the embarrassment to government. As it was the rice diet that seemed to be the main inducement to them I declined to give it in order to deter other picketers coming in. They did not also deserve rice diet.¹²

What the presidency magistrate failed to mention was the fact that denial of rice diet did not stop the anti-Hindi picketing. It rather became more intense. We need to bear in mind here that though a large number of self-respecters volunteered to participate in the agitation, the movement instructed only those who could pay their train fare and bring their own clothes to join the picketing [Irayan 1981:108].

Like the volunteers, even the new leaders who emerged through the agitation were drawn from the ranks of the ordinary. The

case of Swami Arunagiri Nathar is rather instructive here. The official characterisation of Arunagiri Nathar ran as follows:

He indulged in such scurrilous attack against the Premier's character and actions that I came to the conclusion...that none but a person of very depraved character was capable of indulging in such abuse of others at a public meeting. It was quite clear from his speeches that the title of swami assumed by him as well as his holy garb were only cloaks covering up a wicked nature...The [police] report received was to the effect that the petitioner was an itinerant preacher with no fixed place of residence. He came to notice recently in the anti-Hindi movement. He was then staying in a mutt on the Thiruvattiyur High Road. Beyond this nothing is known of his status...The sub inspector wrote that from his enquiries, he found the man's habits and associations were of low order...¹³

Importantly, Arunagiri Nathar's so-called scurrilous attack was framed in terms of anti-brahminism; and the songs he wrote against Hindi, which inspired a large number of anti-Hindi volunteers, contained all the ingredients of Self-Respect Movement's stance on Sanskrit.

In keeping with this trend of large-scale subaltern participation in the agitation, the first anti-Hindi volunteer to die in prison was L. Natarajan, an Adi Dravida. Reporting his death in the Madras legislative council, Rajagopalachari referred to him as "an illiterate harijan". His illiteracy came to signify for Rajagopalachari and other nationalists the illegitimacy of the anti-Hindi agitation – as the following snatch of discussion that took place in the Madras legislative council shows:

Sri K V R Swami: "How did this illiterate man who had no knowledge of even his mother tongue happen to take part in the anti-Hindi movement?"

The Hon Sri C Rajagopalachari: "A very interesting and relevant question, Sir, but the government cannot answer it."

Abdul Hameed Khan Sahib Bahadur: "May I know, Sir, whether it was due to his illiteracy that he got this illness?"

The Hon Sri C Rajagopalachari: "It was due to his illiteracy that he picketed and it was due to his picketing that he happened to be in the jail, but his illness was certainly due to other causes" (Laughter).¹⁴

While Rajagopalachari and other nationalists foregrounded the connection between language and literacy/scholarship/knowledge, what they refused to acknowledge was that language was a question of power. What escaped their attention was that language issue in the region has already emerged as a site for the subaltern classes to articulate their emancipatory desires by problematising disempowerments based on caste, gender and region, and not merely the

desire for literacy. Responding to Rajagopalachari's comments, *The Justice*, an ally of the Self-Respect Movement, wrote, "What the premier obviously wanted to suggest was that opposition to compulsory Hindi from illiterates need not be treated with any respect or consideration. This is not a right attitude for a government, which claims to be popular, to take..." (*The Justice*, January 25, 1939).

Not lagging behind these ordinary men, a large number of ordinary women also took part in the anti-Hindi agitation. In all, 73 women were arrested and jailed for their involvement in the agitation. Several of them went to jail with their children. An exasperated member of the Congress ministry, T S S Rajan, the minister for public health, commented that women were getting arrested to get milk for their children in jail [Anandhi 1992: 199]. While E V Ramasamy was jailed for inciting women to participate in the agitation, it was a women's conference which gave him the title 'Periyar' or the 'great one' as he was languishing in jail. What needs to be kept in mind here is that, unlike the Congress, the politics of the Self-Respect Movement never carried the middle class stamp of respectability; and even so all these women found it worthwhile to lend their participation to the anti-Hindi agitation.

The participation in the anti-Hindi agitation by such subordinate sections as the sudras, Adi-Dravidas, women and illiterates was in conformity with the manner in which language issue was addressed by the Self-Respect Movement as an element in the politics of empowerment. The emergence of such an historic bloc based on a spectrum of subalternities, however transient it had been, was a moment of national-popular will finding its articulation.

Writing of the need for a unified language for the nation so that an "organic unity between theory and practice, between intellectual strata and popular masses, between rulers and the ruled" gets established, Gramsci notes, "What this language will be, one cannot foresee or establish; in any case, if the intervention [for such a language] is 'rational', it will be organically tied to tradition, and this is of no small importance in the economy of culture" [Gramsci quoted in Forgas 1993: 188]. For Gramsci, tradition here stands for the connectedness with the people. The Self-Respect Movement's politics around Sanskrit and Tamil, recounted in the preceding sections, may be viewed as a search for such a language. The career of this search was marked by new ways of interrogating and reconstituting pre-existing relations of authority and subordination in

the Tamil society; and held out, as a consequence, possibilities of forging a broad historic bloc with the agenda of reordering the society on a democratic basis. This is central to any national-popular project aiming at overcoming the disarticulation between the 'nation' and the people.

While the nationalist narratives, by reducing the meaning of the language question in Tamil Nadu as singularly anti-national, makes invisible alternate ways of imagining politics based on the national-popular will, it is ironically the voice of the so-called 'anti-national' which recovers such politics for us. At least in the particular historical context of Tamil Nadu.

Notes

[An earlier version of this paper was presented at a conference organised by the department of sociology, University of Hyderabad, Hyderabad, sometime last year. I am grateful to Anandhi S. Janaki Nair, J. Jeyaranjan and Padmini Swaminathan for their useful comments which helped me in revising the paper.]

NEW FROM SAGE

BARGAINING POWER, WAGES AND EMPLOYMENT

An Analysis of Agricultural Labor Markets in India

GAURAV DATT

This study offers a new perspective on the analysis of agricultural labor markets in India. The author develops a new bargaining model of the casual labor market at the village level. The model determines the wage rate, the level of employment and the employers' profits, and is consistent with the key stylized features of agricultural labor markets, including the co-existence of wage variability and unemployment.

1996 • 224 pages • Rs 295 (cloth)

This book provides a critical but balanced account of the process and impact of urban policy and planning in a developing country like India. The author utilises a multi-level analysis combining anthropological techniques with an understanding of political factors to outline the many elements that prevent the effective implementation of policies aimed at the urban poor.

3 For details of the controversy, see Suntharalingam (1980:151-56).

4 In the novel, Gnanambal proceeds further and says, "Whoever learns whatever language, the country of that language is the appropriate place for them. Hence, we shall send those who learn English alone, without learning their mother tongue, to England; those who learn French alone to France. Since Latin and Sanskrit do not have countries of their own, we shall send those who learn these languages to anonymous islands" [Vedanayagam Pillai 1984: 310].

5 According to the late Sankaracharya of the Kancheepuram Mutt, a relentless defender of brahminism, "It is wrong to hold language as superior to religion or god. If it [the defence of Sanskrit] is just for the sake of language, I would say 'no' to Sanskrit. But all the vedas and shastras are found in that language. So I am saying to protect vedas and shastras, we should protect Sanskrit" [Chandrasekarendra Saraswati Sankaracharya 1992:1, 312].

6 During the 1970s, M Karunanidhi, the DMK chief minister of Tamil Nadu, attempted to implement archanas in Tamil, which was resisted, as in the past, by the brahmins. A provoked Karunanidhi announced, "If the right to perform archanas in Tamil is denied, Sanskrit considered as devabhasha [language of Gods], and along with that god and religion also, will be driven out from Tamil Nadu to north India" [Presler 1987:130].

7 The claim that Sanskrit is the means to Indianness continues with vigour even today. In a recent judgment on teaching Sanskrit as elective subject in secondary schools run by the central board of secondary education, the Supreme Court observed, "Without the learning of Sanskrit it is not possible to decipher the Indian philosophy on which our culture and heritage are based". Elaborating further, it noted, "It is well known that Sanskrit is the mother of all Indo-Aryan languages and it is this language in which our vedas, puranas and upanishads have been written and in which Kalidas, Bhavbuti, Banbhata and Dandi wrote their classics. Teaching of Sankaracharya, Ramanuj, Madhwacharya, Nimbarkand Vallabhacharya would not have been available to them as a medium of expressing their thought" (Santhos Kumar and others vs the secretary, ministry of human resource development 1994).

The Self-Respect Movement was launched by E V Ramasamy, after he broke ranks with the Indian National Congress. His active sojourn in the Congress came to an end in November 1925 when two of his resolutions seeking 'communal reservations' (i.e., caste-based reservations in favour of the non-brahmins) were disallowed in the Kancheepuram conference of the Tamil Nadu Congress. Thereafter, he declared his political agenda to be 'no god, no religion, no Congress, and no brahmins'. For accounts of the Self-Respect Movement, see Chidamparamanar (1983); Visswanathan (1983); Arooran (1980:152-251); Anandhi (1991); Pickering (1993); and Pandian (1993).

Domestic Product by Gender in the Framework of 1993 SNA

A C Kulshreshtha
Gulab Singh

This paper attempts (i) to examine the production boundary in the 1993 SNA from the point of view of capturing the activities of women in the estimation of domestic product, (ii) to measure housewives' services in the concept of Extended Net Domestic Product and in the satellite accounts provided in the 1993 SNA framework, and (iii) to estimate the share of women in the Extended NDP. Concepts, data availability and gaps in it for estimating domestic product by gender are also discussed.

It hardly needs to be dilated that the productive efforts in the society affecting the micro and macro economy and welfare include not only market production but also household non-market production. However, the official statistical system does not fully reflect this. Much of the work of women, particularly household women which forms a major part of the household non-market production, goes unreported in the accounting framework of the System of National Accounts (SNA). This is partly because of convention and partly because the work which connotes human effort devoted to production of goods and services having utility but does not necessarily generate income by way of marketability and hence poses measurement problems. So it is primarily the contribution of women to the economy and welfare that is made invisible (see for example, Eisener 1989, Ironmonger 1989, Goldschmidt-Clermont 1990 and Chadeau 1992).

This paper attempts (i) to examine the coverage, i.e., production boundary in the 1993 SNA, from the point of view of capturing the activities of women in the estimation of domestic product by gender, (ii) to measure the value of housewives' services (at 1980-81 prices) in the concept of Extended Net Domestic Product (NDP) as suggested by Mukherjee (1985 a, b) and also in the satellite accounts provided in the 1993 SNA framework, and (iii) to estimate the share of women in the Extended NDP. Concepts, data availability and gaps therein for estimating the domestic product by gender have also been discussed *inter alia*.

SYSTEM OF NATIONAL ACCOUNTS

The System of National Accounts (SNA) consists of a coherent, consistent and integrated set of macro-economic accounts based on a set of internationally agreed concepts, definitions, classifications and accounting rules. It provides comprehensive accounting framework within which data can be compiled and presented in a format, i.e., designed for the purposes of economic analysis, decision-taking and policy-making. The accounts themselves present in a condensed way a great mass of detailed

information organised according to economic principles and perceptions about the working of an economy. The 1993 SNA may be implemented at different levels of aggregation: at the level of individual economic agents, from institutional units to the level of the total economy. Certain key aggregate statistics such as Gross Domestic Product (GDP) that are widely used as indicators of economic activity at the level of the total economy are defined within the system for calculation of such aggregates has long ceased to be the primary purpose for compiling the accounts. The United Nations (UN) has played an important role in the development of the SNA. For example, the 1953 SNA, the first one, set out a standard national accounting system in order to provide a framework for reporting national income and product statistics which is of applicability and it did influence the development of national accounts statistics all over the world. The 1968 SNA as a result of revision was an elaborate system giving emphasis of consolidated set of accounts and Input-Output Transactions Tables (IOTT). The 1993 SNA (latest revision) is a much more elaborate and comprehensive system harmonised with other statistical systems such as Balance of Payment Statistics, Government Finance Statistics, etc. The 1993 SNA represents a major advance in national accounting. Adoption of the 1993 SNA was unanimously recommended to the United Nations Economic and Social Council by its Statistical Commission at its 27th Session. The Council recommends that member countries consider adopting the recommendations of the 1993 SNA as the international standard for the compilation of their National Accounts Statistics, to the extent possible, to promote the integration of economic and related statistics as an analytical tool and in the international reporting of comparable national accounts statistics. Till recently the socialist countries were following the Material Product System (MPS) where services in general were not taken into account, but now the 1993 SNA has been recommended to be adopted by all the countries. The 1993 SNA treats such countries

which are in transition (from MPS to SNA) as a special case. The history of SNA combines two concerns; the development of national accounting and the internationalisation of statistical concerns. The internationalisation history, in turn, encompasses two concerns, the comparability of economic statistics and the development of international standards and guidelines.

GROSS DOMESTIC PRODUCT

Gross Domestic Product (GDP) of a country, by definition, is equal to the sum of the gross value added of all resident institutional units engaged in production plus any taxes less any subsidies on products not included in the value of their output. So, gross value added by all production activities within the geographical boundary of a country is not its GDP because it may exclude some of the production of a resident institutional unit taking place abroad. Conversely, some of the production within the country may be attributable to foreign institutional units. An institutional unit is said to be resident within the economic territory of a country when it maintains a centre of economic interest in that territory – that is, when it engages or intends to engage in economic activities or transactions on a significant scale either indefinitely or over a long period of time, usually taken as one year. In measuring the output, it is essential to take account of all the goods and services produced during the period whether these are marketed (i.e., exchange for money) or bartered (i.e., exchanged for other goods and services) or used for self-consumption (e.g., agricultural products consumed by the farmers). This measure should be such that production of any particular item is not counted twice. Though it is said that all goods and services whether marketed, bartered or used for self-consumption are taken into account but the fact remains that there is a conventional boundary line and not all goods and services produced for self-consumption are taken into account. Certain activities are excluded, as convention, in the estimation of GDP, these primarily relate to illegal activities such as smuggling, black-marketing, prostitution, etc.

In addition, the services of housewives, i.e., production of goods and services by the women in the house for the consumption of household are also excluded mainly because of the problem of measurement. The 1993 SNA recommends inclusion of illegal activities within the production boundary. It also recommends some of the activities undertaken by the women for example, carrying water for self-consumption and goods produced by the household and consumed, in the estimation of domestic product.

There are three approaches used in the measurement of GDP. First, known as production approach, where the domestic product is estimated in each of the sectors of the economy by considering its output and subtracting the value of material inputs. These sectoral GDP are then added over to arrive at the GDP of the economy. The second approach is the income approach. In the process of production, income generates to the factors of production, namely, labour and capital. In other words, the income is distributed in the form of either capital income (return on capital) to the owner of the capital or labour income (wages, etc) to the labour employed or mixed income to individuals who are partly owners of capital and partly work as self-employed labour for production in their own enterprises. The distributed capital income is mainly in the form of dividend, interest and rent on land. In detail of the four factors of income, namely, labour, and, capital and entrepreneurship are considered then the shares of these factors which are called the factor shares consists of wages and salaries, rent, interest, dividend and profit or loss. These factor incomes when added along with the consumption of fixed capital make GDP by income approach. The third approach of the estimation of GDP is the expenditure approach which consists of the final bill of goods and services. Thus, in the expenditure approach the GDP is arrived at by adding the final expenditure namely, Private Final Consumption Expenditure (PFCE), Government Final Consumption Expenditure (GFCE), Gross Fixed Capital Formation (GFCF), net exports and additions to stock. The Net Domestic Product (NDP) is obtained from the GDP by subtracting consumption of fixed capital. The difference between the GDP and Gross National Product (GNP) is the net income earned from abroad. The popular term national income is the Net National Product (NNP) at factor cost. In India, the GDP is estimated by mixed approach, i.e., in some of the sectors production approach is followed and in other sectors, income approach is followed. Basically, the production approach is followed in the sector of agriculture, forestry, fishing, mining and manufacturing. The income approach is followed in the service sectors.

ESTIMATION OF GDP BY GENDER

Directly, it is not possible to determine the share of GDP by gender when the approach followed is either the production approach or the expenditure approach. However, by following income approach the share of GDP by gender can be arrived at making use of the information on the working force and the corresponding wage per worker by gender. Thus, in the sectors where the income approach has been followed in the estimation of GDP, GDP by gender can be arrived at provided information on working force by gender and wage differentials are available. The working force by gender is available from the Population Census Data but the data on wage differentials in various sectors of the economy are scanty. It may be mentioned that as far as organised sectors are concerned, particularly the public sector, where there is no wage differential, the GDP by gender can be arrived at just by using information on the working force. It is the unorganised segment of the economy where concerted efforts have to be made to obtain the information on wage differentials and more importantly capturing the women's participation in the economic activities through the working force by carefully asking questions at the time of Population Census.

In the sectors where production approach is followed in the estimation of GDP, directly the share of GDP by gender cannot be obtained. But even for these sectors, factor incomes have been estimated utilising information from various sources. In the factor incomes, the compensation of employees is as usual the product of working force and the wage rate and so it can be divided by gender. As regards the operating surplus, ideally speaking, one can attempt the division of operating surplus by gender provided the ownership of enterprise/activity is available by gender. There would no doubt be difficulties in getting the requisite data for bifurcating the operating surplus by gender.

In the expenditure approach, where the GDP is the sum total of the final bill of goods, one can think of identifying the final consumption by gender. This would require information on PFCE, GFCE and GFCF by gender and so on. The PFCE can be divided into male-female components by using population-sex ratio provided consumption within the household is assumed to be gender neutral and if not, then consumption differentials by gender have to be estimated by mounting special surveys/studies. Too many assumptions would be involved and therefore, not much interest in deriving GDP by gender through this approach.

UNPAID WORK OF WOMEN IN THE 1993 SNA

The production boundary of 1993 SNA draws on the distinction between goods and services. It includes the production of all goods within the production boundary and the production of all services except personal and domestic services produced for own final consumption within households [other than: (i) the services of owner-occupied dwellings, i.e., imputed housing services for own consumption produced by owner occupiers in their capacity as un-incorporated enterprises, and (ii) domestic services produced by paid employees who are to be treated as independent un-incorporated enterprises serving households]. The 1993 SNA excludes all production of services for own final consumption except for paid domestic services and owner occupied housing on the grounds that:

- production of such services within households is a self-contained activity with limited repercussion on the rest of the economy;
- there are typically no prices that can be satisfactorily used to value such services and the estimated values would not be equivalent to monetary values for analytical or policy purpose; and
- if personal and domestic services by members of households for own final

TABLE 1: NUMBER OF WOMEN, PERCENTAGE AND NUMBER OF MARRIED WOMEN BETWEEN 15 AND 44 YEARS FOR 1971, 1981 AND 1991

Items (1)	1971 (2)	1981 (3)	1991 (4)
No of women between 15-44 years, in crores	11.52	14.38	18.77
Percentage of married women between 15-44 years	83.90	80.48	75.49
No of married women between 15-44 years, in crores	9.68	11.55	14.17

TABLE 2: EARNING PER WORKER AND CONTRIBUTION OF WOMEN TO UNPAID HOUSEHOLD WORK AT 1980-81 PRICES

Items (1)	1970-71 (2)	1980-81 (3)	1990-91 (4)
Earnings per worker (Rs)			
National average	4,610	4,959	6,601
Agriculture	2,978	2,882	3,224
Women's contribution to unpaid household work (Rs crore)			
National average	44,579	57,376	93,536
Agriculture	28,797	33,345	45,684

consumption are included, all persons engaged in such activities would become self-employed, making unemployment virtually impossible by definition.

With regard to own account production of goods by households, the 1993 SNA has removed the 1968 SNA limitations which excluded the production of goods not made from primary products, the processing of primary products by those who do not produce them and the production of other goods by households who do not sell any part of them on the market.

As indicated earlier all goods produced within the households, even though for own final consumption, are included within the production boundary of the system and if non-marketed, have to be evaluated at equivalent market price. These for example include:

- (i) agricultural produce and their subsequent storage, gathering of uncultivated crops for own consumption, wood cutting, collection of firewood, hunting and fishing;
- (ii) mining salt, cutting peat;
- (iii) supply of water which is a kind of activity similar to extracting and piping of crude oil;
- (iv) processing of agricultural products, production of dairy products (butter and cheese);
- (v) production of baskets and mats;
- (vi) weaving of cloth, tailoring, etc; and
- (vii) production of footwear, production of pottery, utensils, making furniture and furnishings and all other productive activities of similar type.

In all these activities women are active participants. Production of all goods which are marketed is accounted for in the estimates of GDP through various sources of data including the Enterprise Surveys of the Economic Census. It is only the own account production for self-consumption which needs to be covered. Here, the own account consumption of the agricultural products whose output is estimated based on the cultivated area is included in the official estimates of National Accounts. For capturing the value added from other activities, however, suitable household sample surveys have to be conducted. It may be mentioned that in the existing National Sample Surveys (32nd, 38th and 43rd Rounds) we do get information (Appendix Table 3) on proportion of rural women engaged in household duties and also participating in specified activities for household use to total women engaged in household duties. If only we had a time disposition study and some information on the opportunity cost we could get the value added from the activities mentioned above, where the contribution of women is just getting missed for want of requisite data.

As mentioned earlier, personal services for own final consumption within the same

household such as preparing meals, child care, house cleaning, transport and culture services (except for services produced by employing paid domestic staff) are excluded from the production boundary. The 1993 SNA does, however, suggest that in satellite accounts an alternate concept of GDP be elaborated which is based on an extended production boundary, including estimates for household production of services for own use. There are three possible ways to construct a satellite account – the net approach, the input approach and the output approach. The most commonly used perhaps being the net approach, which takes into account only of working time and its value. The difference between the net approach and the input approach is that the input approach covers intermediate consumption.

VALUATION OF SERVICES OF HOUSEWIVES (UNPAID)

As mentioned earlier, the value of the household services is usually not included in the GDP. If one wishes to measure household production it is necessary to calculate the economic value of the productive activity involved, but the difficulty with unpaid housework is that it has no market value in the form of wages. Many possible valuation methods have been proposed, which give differing results depending upon the wage figures used. In the literature three different methods are used to evaluate the value of household services. All of these require the information on the time put in by the housewives and the corresponding rate at which this time or its proper parts are to be evaluated. Weekly person-hours may be converted to person-years (N). We need this N and an average annual rate of earning (E) for evaluation. Choice of E differentiates one method from the other for evaluating the household services. E is taken to be either the opportunity cost of the housewife or the cost of hiring a single individual to do all the household work (market substitute), or if N is split into its proper parts, for example, time devoted to cooking and preparation of meals, house cleaning, child care, elderly care, shopping, etc, say N_i , and each function is separately evaluated by the corresponding nearest market alternatives (E_i), thus instead of NE we have $\sum N_i E_i$ as the measure of the household services. The opportunity cost estimate has been arrived at in different ways in the literature by various authors. Nordhaus-Tobin (1972), for example, by and large, used the wages of female earners in manufacturing. In the Indian context, Mukherjee (1985b) has used two alternatives, namely, earning per worker (national average) and earning per worker in agriculture.

To estimate the value of the service of housewives (unpaid) for 1970-71 and 1980-81 we have used the information on the

working force, etc, as given in Mukherjee (1985b). For 1991 Census, the number of main workers are available for nine industrial classifications for India excluding Jammu and Kashmir (J and K). The 1991 Census also provides the total population of India (including J and K). We have applied the ratio of main workers to the total population of J and K as obtaining in 1981 Census to arrive at the number of main workers in J and K in 1990-91. This number of main workers has then been assigned to nine industrial classifications of the main workers assuming the same participation rate as obtaining in 1981 Census for J and K. This then has been added to the number of main workers of India (excluding J and K) as contained in 1991 Census (Paper 2 of 1992) to arrive at the total number of main workers in India. We have not taken into account the number of marginal workers. The estimate of labour force thus arrived is, therefore, comparable with that of 1971 and also 1981 as given in Mukherjee (1985b). Number of women between 15-44 years and the percentage of married women between 15-44 years for 1971 and 1981 are taken from the census publications. For 1990-91 the number of women between 15-44 years have been taken from the Report of the Expert Committee on Population Projections (1987) which is 18.77 crores. For working out the percentage of married women between 15-44 years, in the absence of the information from census publication, we have used General Fertility rate 119.2 and General Marital Fertility rate 157.9 as available in Sample Registration System – Fertility and Mortality Indicators 1991. The percentage of married women in reproductive age group for 1991 is thus taken as 75.49. Using this information, number of married women between 15-44 years in 1991 comes out to be 14.17 crores. From Mukherjee (1985b), Census of India, 1981 and Sample Registration System, 1991 we get the figures for 1971, 1981 and 1991 (see Table 1).

We have used the estimates of NDP at 1980-81 prices which are available in the current series of the National Accounts Statistics (NAS). The estimate of gross value added in household industries for 1970-71 at current prices are available in Annex 6.4 – National Accounts Statistics – Sources and Methods, 1980. This gross value added has been converted to net value added assuming the same consumption of fixed capital ratio as obtaining in respect of un-registered manufacturing. The NDP thus arrived at for household industries for 1970-71 has been converted to 1980-81 prices by superimposing the price index of NDP of un-organised manufacturing as available in NAS-Disaggregated Statements, 1992 and NAS, 1995.

The working force and estimates of NDP at 1980-81 prices for the years 1970-71,

1980-81 and 1990-91 are given in Appendix Table 1. Using the figures of this table we get the average earnings in Rs per worker at 1980-81 prices. Using the average earnings per worker and the number of married women in the age group 15-44 years we can obtain the estimates of the women's contribution to unpaid household work at 1980-81 prices. These are presented in Table 2.

WOMEN'S CONTRIBUTION TO NDP AND EXTENDED NDP

Household services is largely the contribution of women. Apart from this, a part of NDP is also contributed by women. For obtaining the share of women in the NDP we have simply allocated the aggregate contributions to NDP by various industrial categories by gender in proportion to their share in the working force. It may be observed from Annex 1 that there is a systematic rise in the women's share in the working force in all industrial categories except for construction and other industries where it has gone down in 1991. The contribution of women in the NDP which was 14 per cent in 1970-71 has gone up to 16 per cent in 1980-81 and to 17 per cent in 1990-91 or from Rs 11,765 crore in 1970-71 to Rs 17,587 crore in 1980-81 and to Rs 32,537 crore in 1990-91 all expressed at 1980-81 prices.

In Appendix Table 2, we present estimates of extended NDP and contribution of women in it which has been computed both when household work is evaluated at the rate of national average earnings per worker and at the rate of average agricultural earnings, at 1980-81 prices. It may be seen that women's share in the extended NDP goes to 33 per cent in 1990-91 which is much higher than their share in NDP at 17 per cent, when agricultural earnings rate are used to evaluate the unpaid household work. When we use the national average earnings per worker for evaluation of unpaid household work, women's share in the extended NDP goes

to 44 per cent in 1990-91. There seems to be some fall in the women's share in the extended NDP in comparison to NDP during 1970-71 to 1990-91 when agricultural earnings per worker are used for evaluation. This is largely due to stagnancy of real agricultural earnings during 1970-71 to 1990-91. The slight increase in the women's participation rates in the working force has not brought about any appreciable improvements in their overall position.

These estimates of contribution of women could be improved if time-use studies of the type Jain and Chand (1982) are available which enable us to quantify the amount of time devoted by women for the household services. The study of Jain and Chand (1982) conducted in the selected districts of West Bengal and Rajasthan reveals that about one-third of the women who reported as non-worker when standard questionnaire was addressed to them, were actually found to be spending few hours each day on productive activities when their time disposition was analysed.

FINAL USE OF EXTENDED NDP BY GENDER

After having considered the contribution of women in NDP/extended NDP it would be pertinent to consider their role in final consumption. No such study has been attempted in the Indian context so far. Subramanian and Deaton (1991) have examined the gender effects in the consumption pattern of the people of Maharashtra using the consumption expenditure data from the 38th Round of the National Sample Survey from Maharashtra State Sample. They have estimated a fairly flexible model of Engle curves including detailed demographic variables. It has been found by them that gender plays a role in consumption patterns. Basic foodstuffs, rice, wheat, other cereals, pulses, milk, meat, fruit and vegetables and sugar are either gender neutral or are consumed in larger quantities when there are more women in the household.

For only two foodstuffs, non-alcoholic beverages and processed food; there is a gender bias indicating higher male consumption.

Estimates of private final consumption are available by object like food, clothing and footwear, furniture, appliances, etc. Some of these, for example, food, clothing and footwear, etc., can be taken to be consumed by individuals within households while others, for example, furniture, utensils, etc., are consumed by the household taken as a whole. Sex differentials can be applied only when an article can clearly be conceived as of need to a person. Consumption of other items can then be split up using the sex ratio in the population. As mentioned by Mukherjee (1985a) it would be difficult to apportion the consumption expenditure on items like gross rent, taxes, fuel and power by gender. The share of women in (i) education and cultural services, recreation and entertainment; (ii) transport and communications; and (iii) medical and health expenditure would be less than those of men. For food including beverages and tobacco the average per head intakes and hence the aggregates for almost all the items in this category are known to be lower for women than for men.

In the input-output framework, the GDP as final use of goods and services comprise private final consumption expenditure, government final consumption expenditure, gross capital formation and net exports. As argued by Mukherjee (1985a), current capital formation is intended for future final consumption, we need not split up capital formation by gender. In the extended NDP, there is some justification for applying to capital the same sex ratio which is worked out for the aggregate final consumption. For apportioning the government consumption expenditure by gender one can perhaps argue with two different approaches, one is that since the government does not discriminate by gender its activities of public ad-

APPENDIX TABLE 1. WORKING FORCE AND CONTRIBUTION TO NDP BY GENDER AT 1980-81 PRICES, 1970-71, 1980-81, 1990-91

ministration and defence, therefore, GFCE needs to be apportioned by sex ratios, i.e., equally. Alternatively GFCE need, to be apportioned proportionately taking individual sub-activities of the government and the proportion to beneficiaries therein. For example, the expenditure on education may have to be divided by the enrolment of male/female students, expenditure on health may have to be divided in proportion to the male/female beneficiaries, the expenditure on law and order and prison may have to be divided in proportion to the inmates, where males are likely to be more in number, etc.

CONCLUSIONS

It has been brought out in this paper that the 1993 SNA is flexible. It does provide a room in the form of a satellite account where the contribution of housewives are considered in totality by extending the production boundary, i.e., as extended GDP. The satellite account in the framework of 1993 SNA also permits treatment of the issues like environment accounting. The damage to the environ-

ment which is caused in the course of the production process in the name of economic development is taken as cost to derive the green GDP which will certainly be much less than the conventional GDP. Women's share in the NDP has progressively risen from 14.1 per cent in 1970-71 to 17.1 per cent in 1990-91. This share really should have been little more had we captured the activities of the household production of goods for self-consumption where women predominantly engaged themselves in the production of goods. In the concept of Extended GDP where women's contribution in the form of housewives' services are included, the women's contribution in the extended NDP has been seen to be significantly higher than that in the NDP conventionally defined in the SNA. The limitation in our computation of women's contribution in the extended NDP is that we have taken a uniform wage rate in the absence of the information on opportunity costs. In fact, for such exercises what is needed is a combination of results of ongoing large-scale sample surveys and studies on Time

Disposition particularly in respect of females. In the estimation of GDP through production approach in a situation where activities of women have been fully taken account of, apportionment of GDP by gender is not possible. However, it is possible to apportion the GDP by gender when it is estimated through income approach. Using income approach the apportionment of the domestic product by gender has been made under certain assumptions. What is left is apportionment of GDP by gender when it is estimated by expenditure approach. It would be worthwhile to attempt the apportionment by gender in the final expenditure aggregate such as PFCE, GFCE and GFCF. The requirement of data and further thinking is required to carry out this study. Such studies nevertheless need to be attempted.

Domestic Prices and World Prices

Murali Patibandla

PRABHAT PATNAIK (1996) uses the neo-classical trade model of price-taking small country assumption to show how protection of the manufacturing sector will be welfare superior to free trade, contrary to the free trade policy implications of the neo-classicalists. My answer to this paper is "let domestic prices be equated to (or approach) world prices in the present". I derive my arguments by contending some of the special assumptions made by Patnaik in his model and also by showing how the protection of the organised manufacturing sector in practice has been counter to Patnaik's idea of increasing output, employment and surplus for government investment through import protection. I do not contend the infant industry argument for import protection but question the validity of arguing for import protection of the organised manufactured sector in the present juncture.

Patnaik derives his theoretical results by relaxing the assumption of full employment of the neoclassical model and by taking a single factor of production, i.e., labour, in the production function. In the standard neoclassical model, under the assumption of full employment and competitive markets, protection of the import competing manufacturing sector (M) leads to its expansion at the cost of the exporting agricultural sector (A), given the input endowments. This causes an increase in the domestic price of M and the producers' surplus of this sector and a net redistribution of income from the consumers of M and also producers of sector A in favour of producers of sector M and government in the form of tariff revenue. It reduces real incomes (commodity bundles) by causing allocative inefficiency in production. Patnaik avoids the contractionary result of import protection by assuming presence of surplus labour and introducing only labour (L) as a factor of production in the production function of the M sector. Import protection of the M sector leads to expansion of its output under the assumption of perfect competition. Since there is surplus labour and L is the only input in the production function, expansion of the M sector will not be at the cost of sector A. As employment increases, domestic consumption of food by the additional labour employed (food availability) increases. Decline in the exports of the sector A is offset by decline in the imports of manufactured goods which retains the balance of trade.

Patnaik's assumption of surplus labour is very justified in the Indian context. My contention is regarding the specification of the production function which incorporates only one input, L. If we go by Heckscher and Ohlin trade theory, there are two inputs, L and capital (K). Sector M is capital-intensive and sector A is labour-intensive. In the labour abundant and capital scarce Indian economy, capital can be taken to be fully employed and there is surplus labour. Expansion of M's output requires more capital than labour. Import protection of M draws capital (and also producer surplus) away from agriculture. If both K and L are required to produce A's good, it leads to contraction of the sector A especially when one assumes fixed coefficients of inputs in production. Contraction of output of A releases more labour than capital as it is a labour-intensive good. Adjustment of employment through decline in wages is not relevant in the present context as we start with surplus labour and labour is paid subsistence wage. As capital-intensive manufacturing sector does not absorb all of the additional surplus labour, import protection of the M sector leads to worsening of unemployment instead of increasing employment as in Patnaik's model.

Furthermore, the neoclassical assumption of perfect competition in the manufacturing sector, which Patnaik does not question in this paper, might not be valid for several Indian industries especially in the present context. The organised manufacturing sector is collusively oligopolistic. In such a case, import protection instead of expanding output of M will lead to contraction of output if domestic oligopoly firms exercise domestic market power and reduce output

in order to keep domestic price high [Patibandla 1996].

Let us divide the economy into three sectors: import competing capital-intensive organised manufacturing sector, exporting labour-intensive unorganised manufacturing sector (for example, cut and polished diamonds, leather goods, handicrafts, etc), and labour-intensive agriculture as before. The protectionist policies pursued in India made macro-economic policies (including the overvalued exchange rate policies) systematically biased in favour of the capital intensive organised manufacturing sector at the cost of the labour-intensive exporting sectors. This might have worsened the unemployment problem. For the period 1970 to 1990, employment in the organised private manufacturing sector grew at an annual rate of 0.68 per cent only while employment in the unorganised small-scale increased at a very rapid rate [Patibandla 1993]. This is despite the macro policy bias against the latter. The recent correction of the exchange rate led to increase in exports of this sector. Since it is labour-intensive, there is a further spurt in employment generation in this sector through increased exports. In other words, the agriculture and unorganised manufacturing sectors appear to respond a lot more positively to price incentives given to them by expanding output and employment than the organised manufacturing sector.¹ One reason for this could be that the market structure of these sectors is more competitive (with a large number of producers) than that of the organised sector. As mentioned before, the incentive given to the organised sector through import protection may facilitate monopoly behaviour in terms of reducing domestic supply and increasing price. In other words, the incentives given to this sector through import protection and other benefits are more of a source of long run monopoly power rather than Patnaik's exposition of output and employment expansion.

PANJAB UNIVERSITY, CHANDIGARH

Advertisement No. 1/96/GP

Applications are invited for a temporary (likely to continue) post of Deputy Director in the pay-scale of Rs.3700-125-4950-150-5700 + allowances in the Population Research Centre, Department of Sociology, so as to reach by Registered Post to the Finance and Development Officer, Panjab University, Chandigarh by 10-1-1997.

Application form alongwith 'Detailed Instructions' can be had from the Cashier, Panjab University, Chandigarh on payment of Rs.75/- for General Category and Rs.30/- for SC/ ST candidates or from Finance & Development Officer by sending a Bank Draft of same amount in favour of the Registrar, Panjab University, Chandigarh accompanied by a self-addressed stamped (worth Rs.8/-) envelope of 30cm x 12cm.

Patnaik shows a growth process in his model by making government draw a part of the surplus² of the M sector (the profit income) in the form of import tariff revenue. This facilitates government investment and capital formation and consequent growth. But if one observes the experience during the last 45 years of protectionist policies, it appears that a major part of surplus for government investment appears to have come mostly from the unorganised manufacturing and agricultural sectors which employ a major section of the poor, instead of the protected sector. Major part of government expenditure is drawn from its revenue through highly regressive indirect taxes and deficit financing. Government investment through deficit financing, if it causes inflation, makes the poor take the major part of the burden. Therefore, the burden of government expenditure might have been borne mostly by the poor but not by the organised manufacturing sector. The overvalued exchange rate suppressed agricultural prices and also other exportable goods' prices which implies that these sectors subsidised the urban consumption. In other words, agricultural sector and government expenditure made feasible by indirect taxes and deficit financing might have kept subsidising the organised manufacturing sector.

The sad side of the story is that the Indian corporate sector has been observed to be zero tax paying and about 100 billion dollars worth of capital has been siphoned off abroad. Who has paid for the surplus for government investment in the Indian economy and who has benefited from it? In the present juncture, the Indian organised manufacturing sector does not deserve high protection from imports at the cost of the exporting labour-intensive sectors. It is important in the present juncture that the policy should use world market price signals to discipline domestic oligopolistic producers instead of sending them a policy signal of indefinite protection [Patibandla 1996]. In the immediate short run, free trade policies will hurt the poor more by changing the relative prices of agricultural and manufactured goods: manufactured goods prices will go down and prices of exporting sectors go up. Increase in employment and real wages in the labour-intensive exporting sectors may take a little longer time. Food security should come through an effective and targeted public distribution system.

There is no doubt about the importance of government investment expenditure (as against consumption expenditure) for achieving economic growth. It is very difficult to see that the surplus for government investment can be generated by protecting the myopic domestic oligopoly agents especially after subsidising them for 50 years and not realising any significant growth benefits.

The undying faith of leftist economists in the benevolence (common good) of government policy intervention is as skewed as the market fundamentalism of a section of free marketeers. I would rather go by the assessment of the Indian state as a cluster of organised vested interest groups whose primary objective has been nothing but division of the economic pie. The market reforms, provided they are properly done³ should shake us up and free us from this trap in the long run.

Notes

1 For example, the response of the agriculture sector to the price incentives under green revolution is commendable.

2 Which has to be the profit income of M as labour is paid subsistence wage: the demand

for M goods has to come from profit income. He talks of profit income in this part of the paper which implies two inputs—capital (owners) and labour—in the production function.

3 This statement of 'market reforms if properly done' requires discussion of larger issues which are beyond the scope of this note.

TBAs: Not Irrelevant

Shanti Ghosh

THIS is with reference to Molly Chattopadhyay's article on traditional birth attendants (TBAs) of south Bihar (*EPW*, July 13). To begin with let it be emphasised that TBAs are by no means endangered professionals. The author has rightly emphasised the role the TBAs play in assisting at birth of the baby, when no other health professional or health facility is available and has highlighted the unscientific and unhygienic methods the TBAs employ which can result in death of the mother and/or of the baby. The herbs used for preventing pregnancy are obviously without effect, and might even produce some unwelcome side-effects. Besides some of the women using them may resort to illegal abortion with disastrous results. The villagers have necessarily to depend on these untrained TBAs as no trained health professionals or health facilities are available nearby. There is of course the advantage of a good patron-client relationship and empathy which TBAs enjoy and which unfortunately health professionals often lack.

Maternal mortality in India is above 400 per 1,00,000 births and in the scenario described by the author, it must be much higher. Newborn mortality too is high and a sizeable proportion of this is due to asphyxia (failure to breathe immediately after birth). Proper management during the few minutes in which the baby traverses the birth canal are crucial to the baby's survival and well-being, and so every effort has to be made to ensure that pregnancy is normal and that there is no likelihood of any complication during delivery. With this in view, some contact with a health professional (usually the auxiliary nurse midwife) are recommended. While eventually the aim is to encourage institutional deliveries as is happening in Kerala and Tamil Nadu, this is a far cry for

most of our rural areas at present, partly because of lack of adequate and suitable health facilities and partly because of the traditional beliefs regarding delivery. According to SRS 1992, only 24 per cent deliveries were institutional, while 76 per cent were home deliveries. Of these only 23 per cent were conducted by trained personnel (TBA, ANM or a doctor) and 53 per cent were conducted by untrained personnel—untrained TBAs, family members or neighbours.

TBAs are being trained for years, and by now the countryside should have been saturated with these trained TBAs. Unfortunately usually the women who are the real TBAs or are planning to become TBAs of the future, do not take advantage of the training and instead many others come forward for training because of the small stipend attached to it. Now under the reproductive and child health programme, the training programme is being strengthened and it is proposed to train 2,00,000 TBAs during 1996-97. There is certainly no likelihood that the TBAs will become useless, irrelevant and obsolete as Molly Chattopadhyay fears.

Missing Girl Children

Juvenile sex ratio variations across the country reveal significant differences in sex ratio patterns among three major social groups – the tribals, the scheduled castes and the rest of the population. Geophysical regions, it turns out, are more relevant than the states as units for analysis of spatial variations in sex ratios. Certain regions, cutting across state boundaries, stand out for their alarmingly low female to male children ratios. The observed patterns raise important questions about the design of women and child welfare programmes and indicate the need for plurality in their design and for area and group specific interventions. 3369

Flexible Specialisation

The debate about flexible specialisation, developed in the context of the advanced countries as an alternative to the mass production paradigm, is no longer limited to the rich industrialised countries. It is also about whether flexible specialisation offers a way forward for industrialisation in the developing countries. L-57

Though no industrial cluster in the world can live up to the flexible specialisation model, it does generate ideas useful for exploring possible roads ahead for low-tech, craft-based clusters in countries such as India. Some findings from the hand-made footwear industry in Agra. L-50

Wrong Capitalist Model

The poor economic performance and the resulting political instability of the post-socialist countries have stemmed from copying, voluntarily or otherwise, the wrong capitalist model. Until they learn from both their own past and the experience of successful late-industrialisers and piece together sensible policies specifically geared to their current status, their efforts to restructure and make the transition to a market economy will continue to sputter. 3383

Class Re-formation

The labour movement which had made an impact on the character of the Mumbai working class in the past is losing much of its capacity to influence class formation at the level of consciousness and struggle. While circumstances have changed, the trade unions are apparently reluctant to recognise the limitations of past achievements and to relate to the new Mumbai working class. L-34

Enemy Within

While the charge of 'Indian' exploitation of Assam can be sustained without much difficulty, such exploitation would be impossible without true-blue Assamese leaders co-operating heartily in return for a share of the loot. 3347

Extra-Territorial Lobbies

Why should the government finance extra-territorial lobbies set up in the wake of the economic liberalisation in 1991 ostensibly to promote bilateral economic co-operation at the 'non-official' level but which actually advance the interests of foreign governments and transnationals? 3350

State and Trade Unions

The state's interventions in regulating industrial relations have by and large dampened independent workers' initiatives and encouraged the fissures which have been the bane of the working class movement since independence. L-39

Alternative Movement?

Are independent trade unions, whose growth reflects the failure of the political unions to meet workers' needs, capable of emerging as an alternative movement? The West Bengal scene. L-44

Less Mobile

The burden of absorbing the growing labour force productively in the economy has become more difficult in recent years with the fall in the rate of out-migration from the backward states. 3391

No China Policy Still

The lack of a coherent, long-term China policy was exposed by the almost exclusive focus, in our response to Chinese president Jiang Zemin's visit, on the power equation and on China-Pakistan collaboration. 3356

Trade Unions and Internal Democracy

I AM delighted that my short article 'Defining Union Work' (July 27) has provoked two responses, one from Blue Star Workers' Union (BSWU) and another from TUSC, Bombay (September 28). However, it is unfortunate that both the responses have missed the spirit of the article.

The responses confine themselves to the tentative and brief suggestion in my article, almost an aside, that if there were greater internal democracy in unions and if there were more established norms and practices regarding time-off during official working hours for office-bearers of a union and other union activists then perhaps it would be more difficult for managements to label certain established practices and rights gained by the union through struggles as 'concessions' granted by them to the activists, to be unilaterally withdrawn at their discretion without their being charged with 'unfair labour practices'. Surprisingly, both responses have first interpreted this mere suggestion as an explicit accusation by me against Vasudevan of BSWU and then proceeded to categorically refute it. Let me straightaway clarify that I had (have) no wish to dilute Vasudevan's contribution either to BSWU or the trade union movement in general. Indeed, I didn't even visualise such an interpretation of my suggestion. But let me elaborate, hopefully with greater clarity, what I was trying to suggest in my article.

Too often in an organisation like a trade union, in the absence of larger, democratic structures, norms and practices, a dedicated, small group of union activists tends to commit itself to the difficult task of unionising workers at the shop-floor and aligning with the larger trade union movement, even at the risk of personal sacrifice and almost the total absence of any social/personal life outside the union/movement. However, the conscious commitment and involvement of these activists, over time, not infrequently tends to get unconsciously translated into the practice of entrusting the same experienced activists with more and more tasks, especially when the union is under constant, systematic assault by the management. It is perceived 'too risky' by the union to delegate tasks to other, not-so-experienced activists. In the process, a certain demarcation tends to set in between activists and other union members. Sometimes, the demarcation gets blurred with the 'alienation' of a large number of union members/workers from the leadership/activists. It is not my intention to suggest that the small, dedicated group is guilty of consciously excluding others. Instead, I merely wish to point out how the dynamics of such processes may, unwittingly, be detrimental to the hard-won rights of the union and its activists in its confrontation with the management.

Thus, in the context of a trade union, where there is an increasing need to actively involve all workers in the functioning and decisionmaking processes in the union, there is an urgent need to consciously, deliberately and insistently ensure that any demarcation between activists and other members does not set in; to ensure that no small group of activists, however dedicated, becomes the personalised symbol of the union itself. There is, then, also the need to ensure that no office-bearer of the union becomes so identified with the union that s/he becomes indispensable to the functioning of the union. These risks – if they may be so labelled – need to be taken by union to ensure that active and ongoing democratic participation, as against formal, democratic rituals, of the ordinary workers in the union gets established in practice.

Besides, let me forward another suggestion worth probing into. Maybe, the union should evolve norms where union activists are paid by the union itself out of its own funds for the duration for which they work for the union and not in the company, as is the practice in almost all large, established national unions in the US, for example. This may not only strengthen links between activists and ordinary union members, it may also lead to greater democratic participation by workers in the functioning of the union and may perhaps bring about greater commitment and concern for the union with greater continuous involvement. It is also likely to lead to more direct accountability of the activists towards ordinary workers in the union. These apart, my article, I repeat, was quite categorical in its assessment of the Bombay High Court judgment in Vasudevan's case as being clearly anti-union rights. In fact, a fair part of my article was devoted to suggesting how this is in tune with the growing hostility towards organised labour in the present times in the emerging context of the political economy of liberalisation, privatisation and globalisation in India.

Finally, let me also take this opportunity to revise another unintended impression given by my article. I seem to have suggested in the article that managements learn to co-operate with unions because they find the unions contributing towards the functioning of the enterprise. Else, managements would never co-operate with unions, recognise them. Unfortunately, this choice of words does not adequately or accurately reflect what I was trying to argue. Therefore, let me restate my position.

No management worth its salt would recognise a union and negotiate with it if it can get away without doing so. The simple basic fact is that the recognition of the union of workers by the management is almost always perceived by the management as a hostile infringement of its rights and powers over how to manage the enterprise. The more uncompromising, militant and strong the union, the greater is the extent of perceived and real infringement of managerial rights and prerogatives over its workforce by the union. The management, then, is forced to negotiate with the union, always temporarily as a tactic, only to the extent the union is able to assert its hold over workers and represent their interests and aspirations. The conflict between the management and the union in an enterprise is direct and continuous. On the shop-floor, there is an ongoing tug-of-war between managers and workers. Therefore, the management is always on the lookout to evolve, experiment with and devise different ways to weaken the effective social and formal power of the union. Confronted with such a scenario, unions also need to continuously and systematically widen and deepen their links with the ordinary workers. I wish to suggest that more internal democracy in a union greatly strengthens such bonds among workers in a union at all levels and provides a wider base from which to fight against the management.

Corporate Slump

THE government's economic reforms have set themselves the objective of enlarging the space available to the private corporate sector in the country's industrial development. Prior to the reforms, initiated in July 1991, the corporate sector was thought to be held back by a mesh of controls and regulations, though in fact the more serious constraints stemmed from institutional and structural factors to do with the narrowness of the domestic market and the character of the entrepreneurial class itself, distinguished by its inclination towards trading rather than manufacturing, its dependence on foreign know-how and brand names and its inability to mobilise large enough investible resources, including corporate savings. While economic liberalisation has eliminated a good part of the regulatory constraints, it has by and large failed to address the structural and institutional limitations. In fact it may have contributed to their accentuation. If, for instance, the widening of the domestic market is a necessary condition for triggering off a cumulative process of capital accumulation, output growth and improved profitability of industry and agriculture alike, this condition can be satisfied only if the development process is egalitarian, whereas the reforms have, if anything, created a socio-economic environment conducive to a sharp aggravation of inequalities. The mercantile and dependent character of entrepreneurship has likewise come to the fore more pronouncedly in the post-reform period.

Under the impulse of the stabilisation policies of monetary restraint, reduction of the fiscal deficit and contraction of the growth of public expenditure together with the sharp devaluation of the rupee, the first three years of the reforms from 1991-92 to 1993-94 saw moderate sales growth and fixed assets formation and also generally low profitability ratios in the private corporate sector. In this period the rate of industrial growth had dipped as low as 0.6 per cent in 1991-92, 2.3 per cent in 1992-93 and 6 per cent in 1993-94 against an average of 8.5 per cent per annum in the 1980s. The next two years saw a pick up in industrial growth to 9.4 per cent in 1994-95 and 11.8 per cent in 1995-96 – which was also reflected in buoyant corporate performance. Sales growth and fixed assets formation accelerated and corporate profitability and savings improved quite markedly.

As per the latest IDBI study of 520 sample companies assisted by it, annual sales growth picked up from 16-18 per cent in 1992-93 and 1993-94 to about 25 per cent in 1994-95 and 1995-96. Annual gross fixed assets formation rose from about 23 per cent in the first two years to 26-27 per cent in the next two years. Gross profit (after depreciation) as a percentage of sales, which stood at around 14 per cent during 1991-92 to 1993-94, rose to a little over 16 per cent in the next two years. An ICICI study of 675 public limited companies in the private sector assisted by it shows similar trends. Net sales growth was

26-27 per cent per annum in 1994-95 and 1995-96 compared with 16-19 per cent in the preceding two years. Gross fixed assets formation was 27-28 per cent in the latest two years against 23-24 per cent in the previous two years. As the inflation rate and the rise in the prices of investment goods were higher in the initial years of the reforms, in real terms the rise in sales and gross fixed assets formation was higher still in 1994-95 and 1995-96. The ICICI study also shows an improved return on sales in these two years. The regular company finance studies by the RBI are unfortunately available only up to 1991-92, but its analyses of the unaudited balance sheets of 1,191 non-financial companies show that while these companies' sales turnover grew by 29.9 per cent in 1994-95 and 25.9 per cent in 1995-96, their gross profits to sales ratio improved from a little over 13 per cent in 1993-94 to nearly 14 per cent in the next two years. While the profitability of the larger sample of companies is understandably more moderate, that the private corporate sector registered an impressive performance in 1994-95 and 1995-96 compared with the first three years of the reforms is borne out by the RBI figures as well.

The supporters of the reforms had seen in the accelerated growth of the private corporate sector evidence that a process of sustained industrial growth had begun. But, typical of the fluctuating fortunes of the Indian private corporate sector conditioned by a variety of macro-economic and behavioural constraints, there has been a slump in its performance in 1996-97. Industrial growth has begun to slow down and so has the growth of exports; and inventory accumulation is being reported in a large number of industries. This is also reflected in the operations of the financial system. Bank credit expansion and the rise in the sanctions and disbursements of the term-financing institutions have been low. The primary as well as secondary segments of the capital market are in doldrums. These discouraging macro-economic trends are reflected in the working of the private corporate sector. According to the balance sheet consolidation for 1,000 companies by *Business Standard*, sales growth dipped to 16.4 per cent in the first half 1996-97, while the gross profits to sales ratio has come down from 13.5 per cent in the first half of 1995-96 to 12.3 per cent in the first half of 1996-97. A CMIE study of 1,187 non-finance companies similarly shows depressed sales growth of 15.9 per cent during April-September 1996 which is close to half the 27.5 per cent growth achieved in the first half of 1995-96 and much lower than the growth of 23-25 per cent recorded in the previous two full fiscal years. Profit before depreciation, interest and tax increased by 11.4 per cent in the first half of 1996-97 against increases of over 27 per cent in the corresponding period of the previous year as well as in each of the previous two fiscal years. What is more, with the likely

sharp increases in interest expenditure and also some rise in taxation due to the minimum alternate tax (MAT), the performance in the 1996-97 as a whole is expected to be even more colourless.

The long-term factors responsible for the slump in the performance of the corporate sector are to be found in the structural features of the Indian economy as well as the character of the Indian entrepreneurial class referred to earlier. The sharp cut in public expenditure in real terms, the inadequacy of domestic saving and the steep increases in interest cost as a consequence of financial sector liberalisation have been the immediate causes of the slow down in industrial activity with consequential adverse impact on the private corporate sector's investment, output and profitability. The argument that the MAT has been responsible for the corporate sector slow down is a spurious one. In the first place, the slackening of corporate sector growth began in the second half of 1995-96, much before the introduction of the MAT. Second, the rise in interest cost had begun in 1995-96 when it rose by 30.3 per cent against increases of 4 to 6 per cent in the previous two years. Thirdly, the MAT on zero tax companies was imposed after the corporate sector had been gifted enormous tax breaks, with the incidence of corporate taxation coming down from 29.4 per cent of profit before tax in 1991-92 to 15.1 per cent in 1995-96 for the IDBI sample companies and from 28.5 per cent to 17.7 per cent of operating profits for the ICICI sample.

The industrial boom of 1994-95 and 1995-96 generated by massive capital inflows from abroad, buoyancy of export-import trade, an upsurge in demand for automobiles and consumer durables and some increase in demand for basic and capital goods, essentially by way of recoupment of ground lost in the first three years of the reforms, could not have been kept up without a significant widening of the demand base of the economy and rise in the domestic saving ratio to underwrite expansion of domestic investment on a sustainable basis. The attempts of the government and the business community to substitute foreign capital and export markets cannot succeed in the long term. The general profile of as many as 9,635 foreign technical and investment collaboration approvals involving investment of Rs 81,860 crore up to the end of August 1996 suggests that they are neither in high technology areas nor do they focus on the export market. A number of infrastructure projects are bogged down by environmental and other procedural infirmities. And given the government's anxious quest for foreign capital on a massive scale, private entrepreneurs entering into joint ventures would appear to have not bargained hard enough with their foreign collaborators to secure reasonable agreements in terms of transfer of technology or using India as a production base for the world market.

The adverse implications of the reforms for the balance of payments is brought out by

the export-import data for the private corporate sector, which are available only for the IDBI-assisted companies. Exports of the 384 companies constituted 8.5 per cent of sales in 1991-92 and the ratio jumped to 10.1 per cent in 1992-93 and remained at 10.5 per cent in 1993-94, 10.8 per cent in 1994-95 and 10.6 per cent in 1995-96. The one-time increase in the export ratio is almost entirely explained by the depreciation of the rupee. In US dollar terms, the rupee depreciated by more than 37 per cent between 1991-92 and 1995-96 (by more 25 per cent in 1992-93 alone) and in nominal trade-weighted terms by about 30 per cent. The large public limited companies which comprise the IDBI study have thus shown little increase in the share of exports in sales in real terms. However, while they have shown no advance in export penetration, their import-intensity appears to have gone up quite significantly. The share of imports in total raw materials consumed shot up from 10.8 per cent 1991-92 to 17.9 per cent in 1995-96. Apart from the rise in imports, what stands out is the sharp increase in overall foreign exchange outgo. While foreign exchange earnings increased by 185 per cent from Rs 5,442 crore in 1991-92 to Rs 15,502 crore in 1995-96, foreign exchange outgo went up by 280 per cent from Rs 7,301 crore to Rs 27,741 crore. As a result, the net foreign exchange outgo which was Rs 1,858 crore (\$760 mn) in 1991-92 rose to Rs 12,239 crore (\$3,660 mn) in 1995-96. These numbers suggest the chilling implications of our private corporate sector's response to the so-called globalisation of the economy.

PEOPLE'S SCIENCE

Defunct Project?

SOMETIME in the mid-1960s when the pursuit of science still carried prestige in India and when technological endeavour was regarded as vital building blocks for developing societies, loose groups of disenchanted scientists, a significant number from the left movement, began a process which in course of time emerged as the people's science movement. And like so many developments in history, this attempt to recapture or reclaim science for the people emerged independently in several parts of the country (as in fact it did in the US, UK and Europe). The best known and arguably the earliest of these is the Kerala Sastra Sahitya Parishad (KSSP) which celebrated 30 years of existence last week. By the end of the 1970s there was a growing, if thin, layer of people's science activists all over the country. The first people's science movement conference organised by the KSSP drew participants from diverse places – science clubs in West Bengal and Orissa, the Lok Vignyan Sanghatana in Maharashtra, science groups in Tamil Nadu, experiments like Kishore Bharti in Madhya Pradesh and the Medico Friend Circle.

By and large these groups were motivated by a Bernalist perception of science – as a body of progressive knowledge which had powered the development of capitalism which now needed to be harnessed to the coming revolution of the masses. The distortions and the anti-people developments in the application of science which had occurred in the course of the pursuit of science within the capitalist project were largely consequences of the misapplication of science and technology, so went the argument. The answer was to apply science and technology for the social good, empower people with scientific knowledge, revitalise indigenous pre-scientific knowledge whose full development had been suppressed because of the import of a sort of premature capitalism under colonial rule. There were many variants of this understanding of science and technology, but few by and large questioned the nature of science. The woman question in science, for instance, was raised not within the people's science movement but in the woman's movement. While it is irrelevant at this point of time to determine what issues were first taken up by whom within the broad range of progressive movements which were gathering force in the late 1970s, this is illustrative of the fact that the people's science movement by and large ignored, often vehemently opposed, the raising of fundamental questions on the nature of science. This blind, and as it turned out unfortunate, faith in science led to distortions which strongly influenced the future course of the movement. For instance, by and large it was assumed that what was defined as decadent cultural practices and blind beliefs could be shed by an emphatic adoption of the methods of science, by applying the scientific rationale. Willy-nilly, the cultural, social, political and economic roots of so-called unscientific social practices became a secondary issue. This view of science and its importance to progressive social development coincided remarkably well with the Nehruvian, nationalist project of inculcating the 'scientific temper' among the people.

Equally true, however, is it that groups like the KSSP which truly became a movement in Kerala were instrumental in putting forth a radically different view of the creation of scientific knowledge and locating the centrality of labour in the endeavour. It used local cultural forms and idioms to project science as a collective endeavour. It also raised, for the first time perhaps, environmental issues and brought to the public platform the debate on whether the people's good was served by mammoth hydroelectric projects while destroying forever ecological niches. By the 1980s, however, the need to put people's science on a national agenda – 'mainstreaming' – led to an emphatic focus on popularising science, the inculcating of an amorously defined 'scientific temper' and inevitably the projecting of science as a magic wand.

People's science thus became a parallel development, a state-sponsored project. And away from public scrutiny, and therefore a non-issue for the state, scientific research has become an irrelevant empire. Interestingly, the people's science movement has spawned other formations focussing on specific areas—for instance, the environment and the drug consumer movements which have challenged, often successfully, industry and the state. And yet the revival of the original impetus of a broad-based people's science movement, to reclaim science for the people, is imperative today. In the absence of a legitimate, well-developed critique of the 'science for development' project, public resources, in funds and even more in physical resources and talented human power created with state funding, are tending to be used for programmes irrelevant to the large mass of the people.

TRADE AND LABOUR

Alternative Social Clause

THE government, business interests as well as trade union circles in India appear to be happy that India had been successful in resisting the linkage of trade with labour standards at the recently concluded WTO meeting in Singapore.

We should certainly be conscious of the dangerous use that can be made of the so-called social clause (making trade dependent on labour standards) by the US and the European Community, which are proposing it from sheer protectionist motives. But the selfish interests of these western promoters of social clause do not invalidate the need for introduction of rules into international trading that will guarantee respect of the fundamental rights of men, women and children in the working place. A social clause as a regulatory instrument is all the more necessary in the developing countries to protect workers and guard them against excesses that might flow from liberalisation and world competition. As it is, no one can deny that in India the industrial climate is marked by ruthless exploitation of cheap labour (including women and children) in the unorganised sector and unhygienic and hazardous working conditions in a large part of the organised sector. With the deregulation of the economy and further liberalisation, the rat race for profits among industrialists is likely to lead to increasing exploitation of the workforce at the cost of the latter's health and trade union rights. An instrument like a social clause in international trade is therefore necessary to protect the interests of the working class, and should not be dismissed as a 'threat to national sovereignty'.

The Indian position, shared by many other third world governments, is that the question of labour standards is extraneous to international trade and that the proper world forum to address the issue is the ILO. India succeeded in Singapore in getting the WTO

to endorse this position. The Singapore declaration says: "ILO is the competent body to set and deal with these standards, and we affirm our support for its work in promoting them." All this is fine. But then, let us remember that even the ILO has not totally delinked labour standards (followed by member-states in their respective countries) from the need for conforming to certain basic universally accepted norms. In the preamble to its constitution (1919), the ILO stated: "The non-adoption by any nation of a really humane labour regime creates an obstacle to the efforts of other countries wishing to improve the lot of workers in their own countries." Still later, in 1948, the Charter of Havana (which has never been ratified) was more specific in linking labour standards with international trade: "The states recognise that inequitable conditions of labour, particularly in the production of goods destined for export, creates difficulties in international trade. As a consequence, each state will take all the measures appropriate and realisable in order to eliminate such conditions on its territory."

The idea of the social clause is therefore not new, and can be made use of in a positive direction by trade unions in developing countries. In opposition to the protectionist orientation of the social clause as defined by the US and the European Community in the WTO, trade unions and working class organisations can redefine social clause based on alternative and universally applicable minimum standards such as abolition of forced labour, minimum age of eligibility for employment, right to organise and collective bargaining, equal remuneration for work of equal value, etc. Incidentally, these standards are incorporated in several ILO conventions that have also been ratified by states. One therefore rightfully expects the governments of these countries to respect them, whatever their level of development. 'National sovereignty' cannot be made an excuse for violating labour rights or giving a blanket approval to industrial units to indulge in unfair trade practices within the country.

The trade union organisations in the developing countries in their attempts to formulate an alternative social clause can further insist on compensatory and accompanying measures (e.g. financial and technological transfers from the richer to the poorer nations) within WTO to help them conform to the minimum labour standards. Child labour in the developing countries, for instance, cannot be combated without developing educational facilities and ensuring the parents of the working children sufficient income.

A move in the direction of an alternative social clause for integrating labour standards with trade relations in the interests of the working class—as opposed to the protectionist interests of the US and the European Community—has already been launched by a group of Swiss trade unions and organisations involved in environmental, human rights and women's issues. Indian

trade unions can contribute to these efforts, instead of rejecting the concept of social clause as a part of international trade relations.

BIHAR

Covering Up Corruption

THE series of scams that have unfolded in Bihar in the past one year has exposed a mafia-like nexus of government officials, contractors and politicians which has been looting the state exchequer for two decades through fraudulent means. More than Rs 2,000 crore have been amassed. In stark contrast to this, 1.5 lakh government employees of various state enterprises, boards, corporations and educational institutions have been working without pay, many for as long as the past five years. Similar has been the plight of some two lakh teaching and non-teaching employees of unaided educational institutions in the state who complain they have been working without salary for more than 10 years. A number of teachers are reported to have died of starvation or committed suicide.

This tragic fall-out of administrative malfunctioning in Bihar makes mockery of Laloo Prasad Yadav's talk of social justice. Though he has stoutly rejected the demand of the agitating teachers to terminate the policy of allowing unaided educational institutions, citing the additional expenditure of Rs 1,000 crore as impossible for the government to bear, he has allowed systematic plundering of the state treasury during his six years as chief minister. Laloo Prasad has blamed the private lobby for spawning unaided educational institutions without satisfying minimum requirements. But what of Laloo Prasad's own assurance to the state legislature in 1990 to renew state aid to these institutions?

Laloo Prasad's six-year rule has turned out to be no different from the previous Congress regimes. A small ruling clique has continued to accumulate privileges. Nepotism remains rampant as shown by the recent appointment of 1,400 lecturers, most of the positions being cornered by close relatives of ministers and top administrators. Health care services, drinking water facilities, roads, education and power supply that enhance the living standards of the masses continue to languish in the state, while large purchases of land have been reported by the income tax department in names of the chief minister's relations and of cabinet ministers. Laloo Prasad's populist gestures of cutting harijan children's hair and bathing them and starting 'charvaha' schools for the shepherd's children have long lost their sheen. The opposition parties, sensing discontent among different sections of the people, have started their efforts to dislodge Laloo Prasad. Whether they succeed or not, the depletion of the state treasury is so beyond redemption, that there can be little hope of relief for the unpaid government employees and teachers.

ASIAN PAINTS

Buoyant Market

ASIAN PAINTS, the premier paint-manufacturing company in India, performed well in 1995-96 following the buoyancy in its end-user industries. Though the construction industry stagnated during the year, the cement and steel industries recorded growth rates of 10 per cent and 14 per cent, respectively, while the automobile industry, another major consumer of paints, saw a 32 per cent growth. Riding piggyback on these segments, the paint industry encountered its third successive year with growth during the year touching 12 per cent in volume terms.

The company was no exception. Its net sales increased by 37.7 per cent and value of production rose by 33.3 per cent over the previous year. However, margins were under pressure with the prices of orthoxylene, the sole raw material used in the manufacture of phthalic anhydride (used for manufacturing paints), rising by 11 per cent. Consequently, the company's total manufacturing expenses rose sharply by 41.5 per cent and operating profit increased only 16.9 per cent, somewhat nullifying the effect of the substantial increase in turnover. Interest charges too increased by 38 per cent with the company resorting to increased borrowings (up 48.4 per cent). While depreciation increased by 17.6 per cent, a 6.9 per cent lower tax provision helped Asian Paints post an 18.9 per cent rise in net profit in 1995-96.

The company produced 88,858 tonnes of paints/enamels/varnishes/blacks (up 11.5 per cent), 17,719 tonnes of synthetic resins (down 4.9 per cent) and 17,786 tonnes of phthalic anhydride (up 6.6 per cent) during the year under review. While the paint division saw a 23 per cent rise in turnover to Rs 757 crore, the phthalic anhydride division recorded a turnover of Rs 94 crore, an increase of 22.1 per cent over the previous year.

During the year, a fire in the paint manufacturing block of the company's Mumbai plant led to extensive damage to materials and stores, work-in-progress and fixed and movable assets. However, a major part of these were insured and the company has filed claims with the insurers.

The company's exports increased significantly by 49.2 per cent during the year while imports kept pace with an increase of 45.8 per cent.

Encouraged by its performance, the company rewarded its shareholders by issuing bonus shares in the ratio of one share for every share held. With this, the company's equity capital has doubled to Rs 41.1 crore.

Following the sanctioning of the rehabilitation-cum-amalgamation/merger scheme of Pentasia Chemicals (PCL) by the BIFR, PCL was merged with Asian Paints

during the year and its assets and liabilities were transferred with effect from October 1, 1994. The company issued one share in Asian Paints for every 25 shares of the erstwhile PCL.

Meanwhile, the company's projects for expansion of paint manufacturing capacities at Ankleshwar, Patancheru and Kasna are under implementation. The Ankleshwar unit's expanded capacity of 50,000 tonnes per annum will be operational from March 1997 and the other two plants are expected to commence production in the last quarter of 1997-98. The company is increasing its paint manufacturing capacity from the existing 1.18 lakh tonnes to 2 lakh tonnes over the next four years. The expansion is expected to cost the company around Rs 200 crore and is being financed through internal accruals and bank borrowings.

For the first half of 1996-97 the company has achieved a marginal sales growth of 2-3 per cent. It claims that the low growth was due to the robust growth last year and the fact that the Diwali festival this year – a time when the paint industry witnesses a sharp increase in offtake – was celebrated in November as compared to October last year. The growth rate for the company for the entire year is expected to be around 14 per cent in terms of sale volumes and about 18 per cent in terms of sale revenue.

The company's share price is currently quoting at around Rs 300 on the bourses, discounting its 1995-96 earnings per share of Rs 13 by a comfortable 23.1 times.

DABUR INDIA

Fancied by Investors

This century-old-company, which went public only as recently as September 1993, has a strong presence in the domestic pharmaceutical market with around 512 products of its own and a distribution network which comprises around 4.8 lakh retailers, 5,478 dealers and 24 branches. The company's strong brand image is not surprising considering that it spends 5.5 per cent (Rs 31.1 crore) of its value of production on advertising. It also invested Rs 2.5 crore during 1995-96 in research and development through its group company Dabur Research Foundation. The company has five divisions, namely, family products, healthcare, ayurvedic products, pharmaceuticals and exports with first two divisions contributing 73 per cent of the total sale revenue of the company.

In 1995-96 the company saw a 44.2 per cent rise in net profit on a 43.7 per cent rise in the value of production over the previous year. The company produced 7,168 tonnes of 'chyawanprash' during the year under review against 5,677 tonnes in the previous year, representing an increase of 26.3 per

cent. While net sales were higher by 38.9 per cent, manufacturing expenses rose by 42 per cent. Following a lower rise in other operating expenses, the company's operating profit climbed by 50.6 per cent. While interest charges rose by 33.5 per cent and depreciation provision increased by 47.8 per cent, tax provision remained constant at last year's level of Rs 7 crore.

The company's exports increased by 46.6 per cent during the year while imports rose by 27.8 per cent. The company's London branch consolidated its operations with a 70 per cent increase in sales. Dabur India also opened a branch office in Dubai to cater to the ever growing demand for its products in the UAE market. Its subsidiary in Egypt, Dabur Egypt, which was set up to manufacture Vatika oil, herbal tooth paste, herbal shaving cream, glucose, etc., has recently commenced commercial production.

Dabur India is setting up a joint venture in Barbados with a 50:50 shareholding with ChiRex in order to manufacture an anti-cancer drug developed in-house, namely, Pacitaxel. Dabur India has also entered into a joint venture agreement with Narini Trading of South Africa and Maitri International (India) to manufacture, sell and trade in the 'Dabur' range of pharmaceutical items in South Africa.

The company completed several projects during the year which included a modern plant meeting international standards for the production of Hajmola tablets at Baddi, Himachal Pradesh; a plant for manufacturing hygienic amla pulp at Katni, Madhya Pradesh; a production facility for ayurvedic veterinary products at Alwar; and expansion of its bulk drug production range with the introduction of melatonin.

It also completed a modernisation programme which envisaged upgrading its existing manufacturing facilities, removal of bottlenecks, increasing productivity and efficiency of plant, installation of sophisticated packaging machines to support introduction of new products and flexible packaging and upgrading the utilities in various plants to take care of growing requirements. The company is now setting up a new injectable unit and another unit for manufacturing honey, pudina and shilajit at Baddi and these are expected to be commissioned during 1996-97. Another major unit is also proposed at Baddi for meeting the growing demand for the company's leading healthcare and ayurvedic products.

Dabur India has also initiated a three-year plan to modernise and expand its distribution network. The company's share price currently quotes at around Rs 250 on the bourses discounting its 1995-96 earnings per share by a healthy 20.7 times, reflecting the high investor fancy for the scrip even in a dull market.

The operations of the cigarette manufacturer, VST Industries, suffered in 1995-96 with net profit declining by 13.7 per cent over 1994-95. The hike in excise duty yet again in the 1995 budget on all segments except in the lowest category (non-filter cigarettes up to 60) was the main reason for this lacklustre performance. Further, the imposition of luxury tax in the states of West Bengal, Orissa and Maharashtra and the entry tax in Bihar added to the decline in profitability with the total impact on the company and its subsidiaries on this account touching Rs 13.4 crore during the year under review.

Thus, though both net sales and value of production increased by 5.1 per cent, operating profit fell by 6.5 per cent over the same period. This was in spite of a 7.2 per cent drop in manufacturing expenses during the year. The bottom line suffered despite a 29.7 per cent dip in tax provision, mainly due to sharp increases in interest charges (up 26.8 per cent) and depreciation provision (up 37.4 per cent).

The company's financial services division performed poorly due to the tight money market situation and the sluggishness in the secondary capital market. As compared to an income of Rs 3.5 crore last year, revenue from this division saw a sharp fall to Rs 1 crore. The division sold 1,10,79,790 units under the Unit Scheme 1964 realising Rs 17.8 crore as the scheme was no longer attractive following the withdrawal of tax incentives offered earlier. Following the poor performance of this division, the company has now decided to divest its controlling interest in its wholly-owned subsidiary, VST Investments.

Due to the fall in profitability, the company was forced to cut the dividend rate from 80 per cent last year to 60 per cent during the year under review.

The company produced 15,143 million cigarettes against 13,469 million produced in the previous year, an increase of 12.4 per cent. Though sale, in volume terms, was higher by 12.2 per cent at 14,981 million cigarettes, the average per unit realisation suffered with total sale revenue from cigarettes falling by 0.2 per cent over the previous year. Export revenue too declined by 14.3 per cent mainly due to the fact that export of cigarettes to the former Soviet Union countries was severely hampered. Imports, on the other hand, increased by 23.4 per cent. However, the company continued to remain the largest domestic exporter of cigarettes to west Asia.

With the company's earnings per share (EPS) falling from Rs 16.9 last year to Rs 14.6, its share price has also declined and is currently Rs 115 on the bourses, discounting its EPS by 7.9 times.

CURRENT STATISTICS

EPW RESEARCH FOUNDATION

A distinctive feature of the OECD countries in the past decade has been a further fall in the share of industrial employment and in the contribution to GDP by industry with a corresponding increase in the share of the services sector. Current government expenditure ranges from 36 per cent to 67 per cent of GDP. Governments of all large industrialised countries show net dissaving. Tax receipts constitute 30 per cent to 50 per cent of GDP. Interestingly, only a few countries like the US, UK and Japan have a positive balance in the technological balance of payments, this is also reflected in a relatively low proportion of patent applications from abroad.

INDIAN INSTITUTE OF MANAGEMENT
AHMEDABAD
offers

19TH FACULTY DEVELOPMENT PROGRAMME IN MANAGEMENT

June 26, 1997 – April 15, 1998

The Faculty Development Programme, now offered for the nineteenth time, has been designed with the objective of assisting in the development of teachers, researchers, and trainers for management education. This one-year full time programme has been built upon the experience gained by the Institute in conducting a series of short-term programmes for university teachers in the past.

For Whom

FDP is designed for management teachers and trainers in management schools, universities, affiliated colleges, professional institutes, staff training colleges, training centres of industrial organizations, staff training institutes of central and state governments, and similar organizations, and agencies in India and abroad offering management and allied subjects like economics, statistics, computers, commerce, banking, psychology, sociology, marketing, labour relations, etc. Participants should have teaching experience of not less than two years and not more than 12 years.

Last date for receiving nominations: February 1, 1997

For brochure and application form, please write to:

Programmes Officer, FDP & RJMCEI
Indian Institute of Management, Vastrapur, Ahmedabad 380 015
Phone: 91-79-407241 • Fax: 91-79-6427896

ASSAM

The LOC Snowball

Hiren Gohain

While the charge of 'Indian' exploitation of Assam can be sustained without much difficulty, such exploitation would be impossible without true-blue Assamese leaders co-operating heartily in return for a share of the loot. Their share has come in the form of central grants under different schemes and projects. In fact, 'scheme' has meant 'scam' in Assam for several decades. An old and long-drawn-out such scandal, known here as the LOC scam, has now returned to haunt the chief minister and his men.

THE most dangerous development for the AGP government in Assam today is little known or understood outside Assam, in spite of incisive coverage in some of the so-called 'national' dailies. The spokesman of the state government has admitted on the floor of the assembly last week that apart from hundreds who had lost their lives in the Bodo-Santhal ethnic clashes in the Kokrajhar district, more than 400 have died of hunger and disease in so-called shelters and refugee camps erected by the government following the massacres. Few seem to have lost their sleep over such trifles. The flood-affected Dhemajidistrict in Upper Assam has reported several starvation-deaths. Last week's papers reported ghastly details of pauperised Assamese tribal peasants selling their daughters to libidinous new-rich contractors of the neighbouring Arunachal Pradesh. Again, the news hardly caused a ripple or put an end to triumphal cavalcades of motor-cars transporting ministers and their hangers-on from one end of the state to another. Extremists are on the rampage, gunning down old men, children and even young brides waiting to be married the next day, in frenzied intra-ethnic vendetta. The state government has duly asked the centre to send more companies of the CRP and the centre seems willing enough to oblige, at least for the time being.

These things, disturbing to any right-thinking and sensitive person, are taken in their stride by so-called regional leaders who are not bothered by such regional affairs. It is business as usual, with ministers haranguing captive audiences with ghost-written speeches and addressing seminars (the current panacea against all our ills) on Drugs and AIDS, noised abroad as "the most menacing problem for mankind today". The treasury is in the red. Files do not move in the secretariat and government offices, as all work of development has ground to a halt. A budget has now been presented, six months

after the AGP took office, with a staggering deficit of Rs 766 crore (in a budget estimate of Rs 4,291 crore). But the finance department is in chief minister Prafulla Mahanta's hands, and all other ministers are at his mercy for approval of any sizeable expenditure or outlay even for budgeted developmental purposes. The chief minister during the last six months has earned a lot of notoriety for lack of initiative and dynamism. While he is held in some affection for his courtesy and sobriety, his non-communal approach and coolness in the face of tense situations, he has provoked ire by failing to take decisions in time and by his penchant for intrigue and dirty tricks. While he has recently promoted batches of MLAs and party workers as chairmen of important development corporations (and some of those MLAs and party-workers are said to be bumbling tyros), he has also made it known for no funds will be released for those corporations at least for a year.

OLD SCANDAL

Yet all these things do not ruffle the chief minister and his men. What has got under their skin is the latest phase of inquiry into an old and long-drawn-out scandal, known here as the Letters of Credit (LOC) scam. Originally introduced with a view to establishing some kind of financial control over rampant misuse of funds, LOCs turned out to be the most rapacious and lucrative device for plundering the state treasury to be used by corrupt politicians in association with contractors, suppliers and venal officials. While the scam spread its tentacles to 11 departments of the state government, the CBI has been allowed to probe only the animal husbandry and veterinary department. According to the present veterinary minister, the CBI has arrested 17 officers, 17 contractors and seven employees of the department. The joint director of the CBI in charge of the probe stated before a division

bench of the Guwahati High Court on December 16 that the CBI had sought the sanction of the state government to proceed against two politicians (AGP leaders?), but has not received it after expiry of three months. The revelation is likely to cause acute embarrassment to a party that came to power by denouncing Congress(I) corruption in mammoth rallies all over the state.

The LOC is a document issued by a department for release of funds earmarked under specific heads for its plans and programmes. It is first endorsed by the finance department and then dispatched to treasury offices located in the district headquarters concerned. The treasury office checks the amount and the purpose mentioned on the document on the basis of instructions received by it from the department concerned. If the amount required to be released fits the facts in its record the treasury office passes the LOC and releases the amount.

The LOC, instead of becoming foolproof, became vulnerable at two points. Unscrupulous officers of the finance department may endorse false bills and LOCs and at the treasury office point also there was room for further manipulation and fraud. The scam apparently started at an obscure rural centre of the Intensive Cattle Development Programme (ICDP), a project funded by the World Bank at a place called Deemow. The scamsters chose the ICDP because dumb cattle were unlikely to leak news of the plunder and their own losses to the press. Another reason attributed to a top AGP leader (I had heard it myself back in 1989) was that the scamsters only helped themselves to World Bank funds and did not touch the money of the Assam government. But since the scam later spread to 10 other departments and engulfed several hundred crores, the original pious restraint apparently did not last long. Two lowly office assistants of the Deemow ICDP centre at Sivasagar district and at the district headquarters and the deputy commissioner (district magistrate) himself are supposed to have been the brains behind the scam. The success of the scam was spectacular. Money flows into the coffers of the district treasury office in a continuous stream. Few bother to keep a tab on the entire inflow and outlet. Hence it was easy for the scamsters to draw out Rs 46 crore from the district treasury office by presenting scores of false LOCs apparently endorsed by responsible officers in the higher rungs of the state bureaucracy, while the entire allocation for the ICDP project in the district had been a mere couple of crores.

One of the office assistants bought property worth several crores of rupees in Guwahati, Mumbai and Bangalore, including hotels, flats in posh areas and started a chain of

newspapers. A junior officer in the district administration, and a young businessman, opened a spate of bank accounts in different banks under assumed names, paying into them tens of lakhs of rupees. A Khasi lady in the finance department got wind of the shady deals and sounded a note of warning, which was duly snowed under the customary bureaucratic verbiage. All this could not have taken place without solid bureaucratic protection and patronage of powerful politicians. The ministers in the animal husbandry and veterinary department came immediately to mind. But there were whispers even at that time that the top man in the government himself was shielding them for his own interest.

GOLDEN GOOSE FOR CONGRESS

When the AGP government fell, the stink of corruption was in the air. But there were no definite clues. However, the Congress(I) government under the late Hiteswar Saikia which followed the AGP in 1991 soon stumbled upon this golden goose and lost no time in collecting the golden eggs. In fact it became even more assiduous and systematic in milking the treasury with fake LOCs. Eventually it became impossible to hide the traces of this massive scam. It was Prafulla Mahanta and other opposition leaders in the state assembly who demanded a probe into the scam. The late Saikia offered to hand over the case to the CBI but Mahanta vehemently protested against it on the plea that the CBI was subject to political pressure. Mahanta demanded a 'house committee' to unravel the scam. It soon became plain that members of both parties were involved in the scam, though at different times. While the Congress(I) thought the CBI would protect them, Mahanta must have considered the house committee safer for his friends. The tug-of-war went on in Assam politics all through the term of the Congress(I) ministry, with leaders of both the parties making high-minded speeches against corruption and enjoining everybody else to keep to the straight and narrow path.

Under pressure of mounting criticism in the assembly and in the press, chief minister Saikia asked K S R Rao, additional chief secretary of the state, to inquire into the scam. Rao established the so far nebulous details on a sound footing, though he was preceded by other officers like Dilip Gangopadhyaya, a capable and honest administrator, whose reports must have helped. In any case, afterwards it became customary to refer to the Rao report in public debates on the matter. Saikia refused to make the report public on the familiar excuse that it was against 'public interest'. Nakul Das, veterinary minister in the Saikia ministry, was one of the prime suspects. Das once prostrated himself publicly at Narasingha

Rao's feet, deepening public suspicion against him, at a time when the former had not had second thoughts about judicial activism.

Before the last assembly elections when the tide seemed to have turned against Congress(I), incriminating details about the involvement of Mahanta and other AGP leaders in the LOC scam began to appear in sections of the local press in graphic detail. While the details really shook the voters, they still decided to give Mahanta and his friends the benefit of the doubt. The reports were dismissed as Congress(I) forgeries prompted by their hopeless situation. Even some Leftist leaders went out of their way to proclaim from public platforms that corruption was not an issue in the present election.

But, like the Hawala scam, the LOC scam refused to go away or remain safely buried. In fact, if events in Japan, South Korea, Italy and England are any indication, these have deeper roots in the affairs of our time. While globalisation and liberalisation are parts of a global hegemonic strategy of imperialism, they have also brought in their wake certain countervailing tendencies disquieting to the friends of imperialism. Imperialism has to concede a certain transparency in governance as a sop to the multitudes fleeced by the world market, which in its turn has triggered a clamour against corruption in high places, seriously damaging the interests of the ruling classes and exposing their criminal links. So it is rather likely that whole hunches of eminent political crooks will be sacrificed by the prevailing 'global capitalist system' to public fury and demand for revenge in order to appease the idol of democracy. Hegemony has to come at a price.

IMPERIALIST STRATEGIES

The trouble is that in this crucial period of transition to a world capitalist system, under expert guidance from Fund/Bank and the WTO, the north-east with fabulous reserves of natural resources (including uranium and exotic plants and animals) beckoning multinational gene-hunters is caught in a vicious circle of under-development and insurgency. Imperialist powers seem to be toying with different strategies and plans – e.g., using insurgency to carve out a Christian state separate from India, allowing the government of India to maintain law and order brutally while risking investments, or letting things boil indefinitely until imperialism can find a 'peaceful' solution. Violence and peace are the names of the two offensives used by imperialism with circumspection. The government of India hopes to increase its bargaining power with imperialism by containing secession and claiming a stake in the natural resources of the region.

There have to be regional politicians acceptable to their own people, or at least to majority communities to hold the north-east in trust. Hiteswar Saikia failed to win the trust of the Assamese, though he did have leading writers, artists and musicians eating out of his hands and singing ecstatic praises of his ability and, well, humanity. The gnomes of New Delhi thought they had a better candidate in Prafulla Mahanta, who managed to win over disgruntled minority communities with suave assurances. But as stated earlier, his stewardship of the state has run into heavy weather. To begin with, the task of restoring normalcy was onerous enough. He seemed happy to let things take their own course. The idea perhaps was that it did not really matter as long as he and his party remained in the seat of government. So he got resigned to the presence and periodical brutality of the army, started stoking inter-ethnic intrigues that erupted into bloody carnage at times and patronising a model of development for the state that drove the state deeper into the vicious clutches of 'outsiders'. One plus point with him is that he has not yet identified the Enemy with the poor immigrant Muslim, though he has not closed that option either. His critics within the party have been harping on his 'perfidy' in not demanding an outright abolition of the IMDT Act, an ingenious device by which Rajiv Gandhi hoped to keep both the autochthons and the immigrants happy. On the one hand, the Act allowed an ordinary citizen to bypass the police and bring direct charges against anyone he considered an alien and, on the other hand, it laid the onus of proof on his shoulders. Now the indigenous people claim that this IMDT Act is a shield for foreigners masquerading as immigrants, with the AASU roping in eminent celebrities from New Delhi in their campaign against it. The immigrants on the contrary believe that it is their sole safeguard against indigenous chauvinism. (A simple and effective solution to the vexed 'foreigners problem' could be the preparation of a national register of citizens in Assam based on the electoral rolls up to 1971, accommodating both listed voters and their descendants, which would clearly separate the sheep from the wolves. But in these days of frenzy nobody seems keen on that.)

SCHEMES AND SCAMS

But all such issues are likely to be pushed into the background if it is proved that Mahanta himself was involved in the first master-plan for the LOC scam. Once the state government is compelled to give clearance to CBI interrogation of AGP leaders who were in charge of the animal husbandry and veterinary department during the first spell of AGP rule, it may release a Pandora's box of allegations and innuendo that Mahanta will find impossible to control. His prestige

and authority within the party, nurtured with such shrewd skill and patience, may collapse in no time, leaving the party in a shambles.

While the accusation of 'Indian' exploitation of Assam can indeed be sustained without much difficulty, it must also be said that that would have been impossible without true-blue Assamese leaders co-operating heartily in return for a share of the loot. Their share came to Assamese politicians and officers in the form of central grants under different schemes and projects. In fact, 'scheme' has meant 'scam' for several decades in Assam. Since the monitoring was poor or deliberately lax, hundreds of crores of rupees meant for developing agriculture and industry in Assam or helping impoverished peasants and destitute tribals had ended up in fat bank balances and illegal property of the top layers of the Assamese middle class. One gentleman siphoned nearly one hundred crores from the textiles and handloom departments of the government of India under a scheme of providing cheap yarn to poor weaving women. He organised hundreds of fake rural co-operatives with scores of false names on the registers, gave hefty allowances to the impostor-secretaries and presidents of such co-operatives and looted several crores every year from money received under that scheme under the benign smiles of central bureaucrats who issued glowing testimonies to him and amidst the hallelujahs of scores of Assamese artists, writers and journalists who were profoundly moved by his patronage of the arts, and also the fervent blessings of both leading AGP and Congress (I) politicians. When the author of the present article, with the help of documents and facts provided by both genuine social workers and jealous rivals, exposed that scam he was denounced in screaming advertisements by "poor village women" as a "criminal in the guise of intellectual attacking a saintly friend of the poor". The saint is now spending time in jail, having been arrested by the CBI presumably for social service.

The LOC belongs to that class of prerogatives of the Assamese elite. Modernisation has not meant an increase of productive activity, but an increasing scope for plunder of the state treasury, with which one could afford such modern luxuries as foreign travel, posh cars, latest household appliances and VCPs and VCRs. But all good things do come to an end. Insurgency, however, for all its confused slaughter, has started rattling the skeletons in the cupboards. While initially the ULFA and their ethnic brethren had been soft on the indigenous wrongdoers, it is a position that has become increasingly insupportable with the rank and file starting to ask embarrassing questions about the role of the Assamese elite. As constraints on development are being discussed in public, exposures of the massive

corruption and fraud in which Assamese politicians and bureaucrats wallowed for decades have also become more frequent and unsettling.

TIGHTENING NOOSE

The noose of the LOC scam inquiry is tightening around the necks of the guilty every passing week. It has derived strength from the vigour with which, until recently, the Hawala scam and the JMM bribery case have been pursued by the courts in the national capital. The question of course is if Mahanta himself was the kingpin of the LOC scam. The evidence, if any, will be circumstantial. The reason for this massive fraud and robbery on the state is not simply a private itch for ill-gotten wealth. It is party funds, illegally operated by one of a few master-crooks, and unloosened now and then for winning elections, bouncing undesirables, silencing critics and seizing control of the party organisation. The methods necessarily have to be borrowed from mafia arsenals. Mahanta will find the needle of suspicion turning towards him. For one thing, he and the party had been close at one time to Rajendra Prasad Bora, the most efficient and influential of the scamsters. That he enjoyed some kind of political support with bureaucratic cover for his operations is clear enough. Already people are talking of corrupt ministers in the AGP government in its first term in office. The thousand crore question is how far Mahanta himself was knowingly involved.

Among the incriminating documents that have come to light are pages from the register-cum-schedule of drafts issued by the UBI (head office, Calcutta) between November 23 and 25, 1990. The overwhelming majority of those drafts, numbering 53 for those days, had been issued to various youth clubs and social and 'cultural' organisations in Nagaon, Mahanta's home constituency, on the eve of president's rule. Most of those drafts were issued under assumed names. When Mahanta claims he had nothing to do with them and that those had been issued perhaps by 'well-wishers' of AGP, the assumed names of those 'draft-dodgers' raise a big question-mark against him. Nor can it be forgotten that the present number two in the cabinet, Atul Bora, himself drew attention to Mahanta's role in those donations point blank in allegations that seized the headlines of Assamese dailies in 1995 and 1996 before the elections. According to the testimony of Mehtab Hussain, an accountant interrogated by the CBI as an accused in the LOC scam, a sum of Rs 47 lakh was encashed from the Sivasagar treasury office with the usual fraudulent LOCs "for preparation of drafts for Nagaon and Thowra constituencies through R P Bora".

The second piece of evidence is distribution of enormous quantities of C I sheets,

a building material much in demand in the countryside of Assam for roofing well-to-do private houses as well as public buildings like schools, libraries, clubs and the ubiquitous 'nam-ghars' or prayer halls. Hussain testified that Rs 55 lakh were drawn with fake LOCs from the same treasury office for purchasing and distributing C I sheets in Nagaon and Thowra constituencies. Under CBI grilling Dhiren Barkakoty, the treasurer of the Nagaon branch of AGP, also revealed that under R P Bora's instructions, on the eve of president's rule and the Bajrang operation of the army, he received and distributed in 1990 bundles of C I sheets coming on five or six trucks. The army operation having interrupted that distribution, he confessed having returned the remainder to Mahanta at his house.

AGP'S FUTURE

Of course, these statements do not conclusively prove Mahanta's guilt in the eye of the law. But they certainly call in question his integrity. When one further takes into consideration the fact that scamster Mehtab Hussain, whose service had been extended by several years after his retirement by Mahanta's fiat according to his own confession, had given lakhs of rupees to AGP leaders known to have been close to Mahanta, it looks certain that Mahanta will not be able to escape serious injury to his future political prospects.

Mahanta has qualities which at this crucial moment in the history of the state make him eminently useful to his party and to the Assamese middle class. He is respected for his sobriety and even temper, his courtesy and social graces. If he has to depart in a hurry, it may deal a crippling blow to his party. That will be a pity as genuine and committed regionalism is not without a democratic potential. Unfortunately, the AGP has no consciously spelt-out ideology and seems to hang together only under the influence of rank careerism and unprincipled consensus. This might, then, be the opportunity to convert the party from a feudal outfit into a modern political organisation with a programme and well conceived policies. (A much-trumpeted industrial revival programme, drawn up by a former director of the Asian Development Bank, is gathering dust in the secretariat, to its framer's chagrin.) So far, as has been shown earlier on, corruption has enfeebled and undermined the little bit of development possible even within the present constraints. A change in the character and organisation of the party at this juncture might have made it more responsive to grass roots aspirations. Such a change would have been welcome to small peasants, tribal masses and tea-garden labour, living under the shadow of starvation, epidemics and pauperisation.

Indo-German Consultative Group

A Ringside View

Nirmal Kumar Chandra

Why should the government, plagued as it is by high and rising revenue deficits, finance extra-territorial lobbies such as the Indo-German Consultative Group formed in the wake of economic liberalisation in 1991, ostensibly to promote bilateral co-operation on a 'non-official' basis? The Joint Letter addressed to the heads of the two governments after the Group's last meeting in Berlin at the end of August represents a sell-out to the German government and transnationals.

IT was quite a surprise for me to be invited by the ministry of external affairs to join the 'non-official' Indo-German Consultative Group (henceforth Group) for its meeting in Berlin at the end of August 1996; under the UF regime, it appeared, a couple of economists with 'unorthodox' views were needed in the team. With some hesitation I agreed. After all, I did not have to defend the government. Besides, I had just written in the *EPW* (June 1, 1996) on German reunification and was keen to refresh myself. At my request, the ministry officials graciously arranged for me to meet scholars at the famous Deutsches Institut für Wirtschaftsforschung (DIW), West Berlin, which has over the decades done commendable work on East and West Germany; when I met them they were as open-minded as I had expected, and my academic 'target' was 'overfulfilled'. On other counts I am less confident.

On reaching Berlin I gathered that the Group was formed in the wake of our liberal U-turn in 1991, to promote bilateral co-operation on a wide front and on a 'non-official' basis, i.e. without the politicians and bureaucrats breathing down the necks of free-thinking, responsible citizens. The Group meets once a year, alternately in Germany and India, and recommends measures to improve bilateral ties in practically all spheres of policy-making – economic, political, scientific, academic and cultural. I also learnt that similar Groups exist for other countries as well. As for the costs, our government paid for the travel of Indians, while the Germans footed the generous hospitality bill; conversely, for meetings in India.

Let me move on to the 'happenings' in Berlin. Within a couple of hours of our landing, we were escorted to a reception by the newly elected communist mayor of Berlin. A short time later, the president of the Federal Republic received us. The luxury bus carrying us meandered through many a landmark in the city with running commentary from a guide concerned as much with history as with politics; it was peppered with more anecdotes from members of the German team.

In all this discourse the *ancien regime* was the object of scorn: the economy was moribund, the living standards were low, buildings were maintained poorly, factories used outdated technologies, and so on. Several Indians, including some who never had any love for communism, were literally bored to sleep. Eventually, we reached Brandenburg, the seat of the Brandenburg state government which hosted us at the historic hotel where Stalin, Truman and Attlee (replacing Churchill who had just lost the British election) concluded the second world war. The senior ministers of the Social-Democratic state government gave informative speeches on the problems of unification, the efforts made to rehabilitate the economy, the high level of unemployment, and the great subsidy burden on the Federal budget.

This was my chance to get the German official response to my simmering doubts. How do the current levels of industrial production and employment in the East compare with those in 1988 or 1989? How does the volume of overall subsidy to the East compare with the forecasts made initially? If these differed, why? I got accurate answers to the first question. Then I put in a supplementary: why were the current levels as low as one-half for output or one-third for employment? For, in December 1990, or one year after the fall of the Berlin Wall, the IMF, in consultation with the Federal government, published a report forecasting that, after an initial fall, the earlier level of production would be surpassed by 1993 or 1994, while employment would catch up a little later. The Germans got confused; not all apparently knew about the IMF Report, and those who did, were not forthcoming. The same was true for my question on Federal subsidies, now running at about DM 150 billion per year, or roughly DM 8,000 per East German. Towards the end, a Federal official came to me and explained that they were misled by the East German officials. None of the Germans present referred to the intense debates in their country about the role of Treuhand, the German privatisation agency, wound up in 1994; it was so managed, the critics allege, that the sick companies

under it became sicker, the agency's losses mounted, and the final sale value of the enterprises was a mere fraction of their 'true' market price. The German officials at the get-together harped on the point that the assets 'had' to be privatised at the earliest, and hence some costs 'had to be borne' by certain social groups or by the national exchequer for the greater 'good'. Does it not ring a familiar bell so us in India?

Evidently, the Germans did not relish my somewhat awkward questions. While it did not affect my personal relations either with the Germans or with the Indian members of the Group who were invariably courteous, it may have had a fallout (see below).

Next morning over breakfast the two sides met separately to chalk out their respective 'tactics' for the formal sessions. We agreed that if the Germans questioned our refusal to sign the Comprehensive Test Ban Treaty (CTBT) on nuclear arms, it should be resisted. Towards the end, I suggested, emphatically endorsed by others, that we should not ask for 'aid' from the Germans in any form.

Actually, the Germans did raise the CTBT and Kashmir issues at the formal session. From the Indian side, there was a spirited defence. I was distinctly unhappy about the pronouncements on Kashmir as I do not subscribe to our official line; but I kept quiet as I felt that the Germans were using it as a tactical weapon to wrest concessions on matters of real concern to them, namely, trade and investment. Indeed, they did not persist, and no joint, or even a separate German, statement was made on the CTBT or Kashmir.

At the formal session on economic issues there were several useful papers. Of these I may mention a lucid presentation of challenges faced by Indian industry from one of our industry associations. The German paper was also illuminating, but with a hidden agenda. The author spoke about the prolonged recession in Germany, the high rate of unemployment, and the preoccupation of German industry with central and eastern Europe; by implication investments in south Asia will remain rather low on their priority, and India will have to work 'harder' to obtain a bigger slice of the cake. It reminded me strongly of a lecture back in mid-1992 addressed to Calcutta industrialists by the late Saburo Okita, an architect of postwar Japanese planning, who was heading a delegation of 200 Japanese businessmen. While the Indians were keen on a larger influx of Japanese joint ventures, Okita told them politely that for geopolitical reasons Japan's priority was east and south-east Asia. Further, in her domestic market Japan had consistently favoured national over foreign firms, without which names like Toyota or Nissan could never become household words all over the globe. The Germans, it is well known, had followed a similar strategy, but none from the Group spoke about it. The problem of unemployment, not only in Germany, but also in India, figured in the

discourse of two of India's leading industrialists. Apparently, it will be on the agenda of next year's meeting. That a serious consideration of this issue, as it has been argued by a wide array of trade unions, economists and businessmen in different parts of the world, might run counter to the gospel of liberalisation, was conveniently ignored. Merely talking about unemployment within the neoliberal paradigm would be like going round the mulberry bush. Has the glittering G-7 summit in 1995 on the same issue yielded anything positive?

Due to the heavy schedule, and the fact that I was just requested to present a paper on the following day on 'common responsibilities of the two countries in the international economic context', I had to skip a few sessions. But I witnessed a bit of commotion during the one on media policy.

The German government had circulated a written note calling upon India to allow the DPA, the German news agency, to disseminate news directly to the Indian newspapers and other media. So far, it has been constrained under India's Press Act, 1956, to sell its services to the Indian agency, UNI; however, an exception was made in the case of the British agency Reuter. "*The Federal government would view a complete liberalisation of India's media market as an appropriate measure*" (emphasis added). Further, "the Federal government has noted with great regret the most recent public statements by the Indian prime minister and the information minister ruling out the 'overdue opening'." The final sentence read: "The Federal government also does not conceal its regret that no Indian government to date has been willing to honour the unparalleled contribution which the Federal Republic of Germany has made in its economic and financial co-operation with India (DM 15.8 billion = US \$ 10.6 billion in commitments since 1958) by making corresponding concessions in the matter of granting DPA unrestricted access to the Indian market". More than one Indian participant objected to the blatant use of aid to demand policy changes, not unlike the Fund-Bank 'conditionalities'; but the end-result was an anti-climax (see below).

I was unhappy at the way much of the discussion was going, and was biding my time to air my unorthodox views on the subject assigned to me. Why repeat? But the management of time was so cleverly accomplished that my paper or non-paper was simply blotted out. My suspicion was strengthened as I read the draft of the Joint Letter (JL) addressed to the two heads of the government in the name of the Group. Let me quote at some length from the final text:

(a) "The Group noted with satisfaction that progress has been made in several areas for which the Group had submitted suggestions in recent years". For example, (i) conclusion of Investment Protection and Double Taxation agreements between the two countries, and (ii) 'overdue' first steps

taken towards the mutual recognition of academic degrees, closer co-operation in the fields of science, technology and environmental policies.

(b) "The Group noted with satisfaction that the economic reforms in India remain on track and continue at a steady pace".

(c) "The Group identified further opening of the financial sector, restructuring of the public sector, fiscal stabilisation, improvement of the infrastructure, and clarity on import and investment policies as calling for special attention and further action by the government of India. The Group agreed on the need for continued deregulation, transparency and competition. In the short run, in addition to simplification of rules and guidelines for the private sector investment in power, priority should be given to improving the operations of existing power plants and systems. *German utilities should be encouraged to invest in the Indian power sector*" (emphasis added.)

(d) "On the basis of many years of positive experience and India's impeccable record of repayment the Group proposed that India's Hermes classification [the German equivalent of Moody's or Standard and Poor] to be upgraded to Category II".

(e) "The Group restated its conviction that enlightened concepts such as protection of the environment, prevention of child labour, and promotion of human rights should not be abused as non-tariff barriers endangering free trade".

(f) "Finally, it [the Group] proposed the extension of Indo-German dialogue to include the systems of and structures governing the German economy with regard to privatisation, the relationship between companies and financial institutions, the regulation of the stock market, the development of instruments to channel savings into productive investment, and the independence of the Central Bank".

The draft had been prepared by several small teams and discussed at the final session. I intervened briefly to state that I disagreed with its general tenor, and more specifically, with the sections on media and economic policies.

On media policy, the draft had stated: "In order to assure a more balanced information flow to India, the German side stressed the importance of allowing DPA direct access to the Indian market." The revised text turned it into a recommendation of the whole Group, Indian as well as German. "[T]he Group stressed the importance of open media markets, while realising that this is an unresolved debate in India... Greater media access for DPA to the Indian market, was seen as a crucial element of enhanced mutual understanding". Surely, the special status of Reuter is an anomaly. Instead of 'free entry' for all, one could also abolish Reuter's privilege. So far, neither our parliament nor public opinion support the former.

If the Germans promoted their 'national champions' like DPA and the German utilities

in the JL, what did the Indians achieve? Apparently, two points, (d) and (e) above, furthered India's interest. As for Hermes classification, the world of credit rating is inscrutable, often highly 'subjective'. The German side seemed to be equally mystified about the rating. The JL is unlikely to have any impact at all on rating. Regarding (d), there are sectoral protectionists, often with support from their own governments, in rich countries that periodically raise a hue and cry about environment, child labour, etc. But the big transnationals in Germany or elsewhere think otherwise. How can they sell their hi-tech wares if cheap labour-intensive goods from developing countries are altogether weeded out?

The Group recommendations (a), (b), (c) and (f) call for opening up the Indian market, which is sweet music to the German transnationals. Not only did their executives make up a large part of the German team, a number of officials from German subsidiaries in India also found berths in the Indian team.

Let me state briefly some of the other issues that should have been raised. India has a chronic trade deficit, reaching Rs 1,279 crore in 1994-95. Is it ordained by the law of comparative advantages? Why can one not ask for a balanced trade? In textiles and garments, Germany (and the European Union as a whole) not only has a quota system, but it is heavily tilted against south Asia in favour of the major trade partners in east and south-east Asia. Could we not demand a more favourable quota regime? Further, like other industrial nations, Germany has stiff non-tariff barriers on a wide range of other manufactured goods and all agricultural commodities; researches conducted by the IMF, World Bank, etc, bear ample testimony, and the barriers have gone up since 1980 at the same time as liberalisation was thrust upon the indebted third world. On the other hand, we in India have a range of world class products which are 'competitive', e.g. BHEL's power generating equipment, C-DOT's telecommunications equipment, black and white as well as colour TV, radio, basic drugs and formulations, etc. Not so strangely, none of these manufacturers, especially from our public sector, found a place in the Indian team.

Let me turn to investments. Like most critics of liberalisation, I do not subscribe to the TINA (there is no alternative) myth. We can borrow a leaf from China. A couple of years ago the Chinese premier Li Peng went to Germany; he offered incentives to investors provided that the Germans undertook to import more from China. As for Germany, she does not practise what she preaches. On the BBC television last October, the former Federal president, Schmidt, spoke bitterly against the Treuhand's selling 80-90 per cent of Eastern assets to West German firms in defiance of all norms, and excluding foreigners as well as buy-outs by East German workers and managers. Actually, the Oberols bid successfully for a hotel in East Berlin

a few years ago, but have since been bogged down in a legal tangle.

In short, the JL represents a sell-out to German government and transnationals in a manner that neither Rao nor Deve Gowda would dare in public. Ironically, the Indian

team had more than one staunch critic of post-1991 liberalisation and WTO. Who called the shots from behind the scene? In any case, why should our government, plagued as it is by high and rising revenue deficits, finance such extra-territorial lobbies?

National Security versus People's Insecurity

Gautam Navlakha

The current concern about the shortfall in manpower in the security forces and the inadequacy of resources must be viewed in the context of the fact that new paramilitary forces have been raised, most of which have been engaged in counter-insurgency operations or for intervention in internal conflicts. There is an urgent need for a sharper scrutiny of the defence spendings which has generally been kept under wraps.

IF "war is much too serious a thing to be left to military men" then it is equally important not to leave it to the discretion of the government. As the Indian parliament discards its prerogative to scrutinise the government's expenditure, the boundaries of 'national security' concerns have expanded. The ministry of defence (MOD) in its *Annual Report 1995-96*, apart from the usual reference to the neighbouring countries, speaks of 'global pressures' on India's nuclear option and missile development; of cross-border terrorism "sponsored by states" as "a major security issue"; of India having "immense strategic stakes" in the west Asian region, central Asian states and south-east Asia; and of "non-strategic and non-military pressures". Let alone the public having access to credible information on this, the official perspective as well as the expenditure incurred on the military escapes all examination.

One reason is that the average duration of parliamentary session in a year has come down to 90 days. With this has declined a proper examination of the budget. Until the 1980s the budget sessions used to last for three months and every ministry was subjected to interrogation. For the past decade or more parliament has been so oppressed for time that very few of the ministries are scrutinised. A 'guillotine system' has been in operation which enables ministries to get their demand approved in absentia. The decline in the duration of budget session prompted the parliament to introduce four years ago a system of standing committees for various ministries which examine budget proposals of the respective ministries. However, there is no link between a standing committee which decides on appropriateness of the demand and the acceptance by the parliament of the demand for grant. The chairperson of the standing committee of industry, Ashok Mitra mentions in his report

that "while demand for grants of individual ministries are considered in parliament recommendation made by the overwhelming majority of the standing committees fall by the wayside".

For instance this year September 6 was set as the deadline for discussion on ministries' demands. As a result the Lok Sabha passed in just 15 minutes, without discussion, demands for grants of over 35 ministries totalling Rs 4,54,349 crore. The ministries included were defence, home, external affairs and industry. In other words matters related to security which directly affect the life and liberty of the people were approved without examining the premises on which defence expenditure was posited, the use of resources allocated in the past decade or so, the proposed use of the resources demanded, including a cost-benefit analysis. Thus executive accountability to parliament, especially in matters related to security which use up one-fifth of the government's expenditure, has eroded. One reason is that political parties are chary of challenging official assumptions and explanations with regard to 'national security'.

The extent to which governing and opposition parties treat security with kid gloves becomes clear from the silence on issues which were earlier considered important by the parliament. Thus even the left parties have not shown much concern about the growing Indo-US military relations, or the implications of US military presence in the Gulf and the Indian Ocean, or even about the reports that the US is seeking facilities in Sri Lanka. There is also little difference between left or right where Pakistan is concerned. In such a climate differences revolve around the quantum of increase in outlay. For instance, the ministry of defence told the Parliamentary Consultative Committee attached to it that it needed Rs 4,106.61 crore over the

1996-97 budget estimate of Rs 27,798.47 crore. The committee felt that the budget should be enhanced by Rs 2,000 crore over and above the allocation made in the defence budget. And it expressed dissatisfaction with the assurance given by the finance minister that additional funds between Rs 1,000-1,500 crore, would be provided during the current year to meet the revenue shortfalls and the extra burden arising out of the recommendations of the Fifth Pay Commission. Significantly, it is now an established practice to allow enhancement of security-related allocations between the estimate and the revised budget. And in line with this Rs 1,200 crore were allocated for defence. A further increase is quite likely with the government deciding to purchase 40 Sukhoi 30 MK fighter bombers from Russia for Rs 6,300 crore thus making room for the army and the navy to demand advanced weaponry for their forces.

Complaints about cuts in defence budget are clearly misplaced. A perusal of the country's budget and, the *Economic Survey 1995-96* shows a steady increase in security outlay. For instance, the *Economic Survey 1995-96* shows that out of the 'total budgetary transactions' of the central and the state governments defence and police outlays (in net terms) rose from Rs 4,800 crore out of total outlay of Rs 36,845 crore in 1980-81 to Rs 36,000 crore out of Rs 3,40,000 crore in 1995-96. This does not take into account expenses tucked away under other headings such as coast guards under the finance ministry, missile build-up under the department of space, nuclear arms preparations under the department of nuclear energy as well as defence pensions, etc, which together push the outlay in 1995-96 upwards by Rs 6,000 crore. In the absence of understanding this historical trend and dispersal of allocations members address the issue superficially, bereft of the need even for prudent resource management.

AVOIDABLE EXPENDITURE

Strangely, even within the parameters of the needs spelt out by the government there are revealing facts. For instance, according to the *Annual Report* of the ministry of defence 1995-96 "Pakistan is ...on an arms acquisition spree" and this leaves India "with no option but to upgrade its own defence capabilities". If for the sake of argument one concedes that this demand is justified it still does not mean additional resource allocation. For instance, the Indian Air Force has lost 82 aeroplanes in 44 months. Financial loss excluding the cost of the aircraft written off comes to Rs 457.5 crore. Only nine were due to bird strikes, the rest because of technical failure or pilot error. Surely the IAF should put its house in order before seeking more money? Besides there is another kind of wastage. According to an audit report of the MOD one lakh AK-47 rifles procured from Romania in 1993 at a cost of Rs 350 crore

were lying unused because North Korea failed to supply ammunition. If to these are added the resources diverted for paying kickbacks, for purchases that are of a questionable nature, or for maintenance of golf courses, or building polo grounds by destroying Delhi's ridge, etc, there is enough room for economy even within the parameters of official security assumptions.

It is also necessary to recognise that there is a mismatch between the stated national security perspective and the purposes for which the arsenal is acquired. As it is let alone the public even the parliament is not privy to premises and other parameters of national security. The Parliamentary Standing Committee on defence which by no stretch of imagination can be considered less jingoistic laments that the MOD informed them that they were denied access to national security documents as a result of a 'conscious decision' of the government. This obviously implies that the officials, who are not elected and therefore have no public accountability have decided to deny Indian people the right to know what the government's security policy is supposed to be. Beyond the narrow corridors of officialdom the policy remains a secret. For all we know it does not exist. A glimpse shows that the national security perspective of the MOD moves from the global to the regional to the local factors which have an "impact on Indian security". It is asserted by the MOD that in view of "the proliferation of nuclear weapons and missiles in our neighbourhood, adequate defensive measures are inescapable". It merely takes 'note' of the "US's substantial forward deployed force projection in the Gulf and the Arabian Sea areas" and also of the "non-strategic and non-military pressures". Which in operational terms means that nothing need be done in response to this. Not surprisingly, there is also no corresponding acknowledgement that the US by storing weapons of mass destruction and its military presence in a region adjacent to the 'neighbourhood' poses a threat to the "immense strategic stakes" that India has in West Asia and the Indian Ocean region. The reason is that the GOI downplays the belligerent role of the US in the region in order to expand Indo-US military ties.

Indian and US marines held an exercise near Ratnagiri in September, the two air forces will hold it later this year and this will include paratroopers. Also, a US coastguard ship is to visit Mumbai for the first time sometime this year. This development has to be read together with our dependence on international capital flow. It has reached a point where the government's economic policy is no longer questioned. Instead, it is now geared to discussing the nitty-gritty of attracting direct foreign investment to cover the current account deficit. Ironically an increase in our economic vulnerability on account of the policy of economic 'liberalisation' has been accompanied with

the projection of a nuclear option and missile development as central to national self-pride. Opposition to CTBT was greeted as though the country had won an Olympic gold medal. Indeed just as terrorism is the single most important source of threat faced by the country these two weapons are being presented as the single most important source of enhancing India's standing in the world and our ticket to big power status. To be sure these weapons offer no insurance against imperial powers. And if we remove the chaff from the grain then these weapons enable their use as instruments of coercive diplomacy in the neighbourhood. As it is the augmentation of force is being justified in the name of a threat posed by Pakistan when our armed forces outmatch that of Pakistan acquisition of arms by India has kept pace with if not actually outpaced Pakistan, and it is our missiles that threaten all of Pakistan.

Nevertheless, the most important factor which compels one to question the prevalent national security perspective is that the bulk of budgetary allocations go towards maintaining the huge standing army and paramilitary which are engaged in internal security operations. The MOD's report refers to "terrorism exported by Pakistan"; that "religious militancy... finds training and arms in Pakistan"; "ISI support a number of insurgent groups in north-eastern India"; and "Pakistan's strategy is to embroil India in internal security problems". This glosses over the internal origins of movements for opting out of India and projects them as being foreign-inspired terrorism. Significantly, deployment of armed might of the government implies a corresponding disfranchising of people. The ministry of home affairs says in its *Annual Report 1995-96* that "keeping in view the reach, size and magnitude of terrorist violence in India and the aid, assistance and connivance from across the border to anti-national elements, the government introduced the Criminal Law Amendment Bill 1995 in the Rajya Sabha". This is despite the countrywide revulsion against TADA. And now we have the Parliamentary Standing Committee on home ministry advocating that if "diplomatic efforts do not yield results as a last resort the doctrine of hot pursuit be adopted". By advocating escalating the conflict government's culpability in causing internal wars is pushed into the background. In addition military suppression to deal with political issues means increase in force deployment which then becomes the *raison d'être* for force augmentation.

Paradoxically, it was the third Territorial Army Review Committee which questioned the need for a large standing army and called for reducing its size so as to cut down defence expenditure "since up to 70 per cent of the defence budget goes into pay, allowances and pensions" (*The Times of India*, August 7). Moreover, Rs 830 crore out of the additional amount of Rs 1,200 crore allocated to MOD is in lieu of higher DA and bonus

for the armed forces personnel. Astonishingly, instead of discussing the pros and cons of the standing army the demand has been voiced to reverse the shortfall in the army by making salaries and perquisites attractive. Reportedly, there is a shortage of 73,000 personnel including officers and other ranks. Also the army has been called in over the past five decades 33 times in UP, 29 in Assam, 16 in Rajasthan, 13 in West Bengal apart from their active presence for past 35 years in the north-east and seven years in Jammu and Kashmir for counter-insurgency. Therefore the army chief claimed that "shortage of manpower is bound to lead to inefficiency and create strain on those in authority... A shortage... will... affect its performance" (*The Times of India*, September 3).

What raises doubts about this reasoning is the fact that the bulk of the shortage of 12,586 officers and 59,436 jawans is primarily in the infantry and artillery battalions. It is these battalions that are engaged in internal wars. For instance, the shortfall of officers in infantry is 3,017, whereas the shortage of JCOs and other jawans number 23,105. In the artillery the respective figures are 2,567 and 23,393. The other factor responsible for manpower shortage is because the MOD raised 36 battalions of new paramilitary force under its command called Rashtriya Rifles. In other words the shortfall is not due to unattractiveness of salaries and perks. Rather it is the fallout of deploying 'Armed Forces of the Union' against our own people and the hardship of counter-insurgency. If anything, this calls for reducing their engagement in internal wars as well as initiating peaceful solutions to internal conflicts.

However, all these demands for reversing manpower shortfall, etc, only mean that the operational parts of the official national security perspectives are related to internal wars which consume large portions of budgeted resources. When this is placed against the background of the failure of militaristic solutions employed by policymakers, proliferation of internal wars, attempts to build weapons of mass destruction in the name of national pride, etc, then allocations of huge resources for 'national security' need to be thoroughly examined, debated, and drastically pruned. Not only is there need to interrogate what passes for 'national consensus' but it is imperative to press for democratic solutions to problems of alienation and oppression. The prevalent notion of national security must be turned on its head. It is recourse to military solution that threaten the democratic aspirations of the people, reduce the appeal of non-violent peaceful struggle, and helps prolong a conflict. This helps exaggerate the threat posed by the neighbouring countries and justifies a military build-up. Thereby, scarce resources are diverted for building up the coercive powers of the government for use against our own people.

Child Labour: A Global Crisis without a Global Response

Francoise Remington

International competition and demand for cheap goods has resulted in global exploitation of child labour in recent years. The World Bank not only continues to finance projects which contribute to the growth of child labour but also eulogises industries which rely on child labour as success stories in its discussion papers.

THE growth of child labour worldwide is the result of globalisation and we all bear some responsibility for its growth. Consumers, human rights groups, child rights activists, religious organisations, politicians, governments, international organisations (such as ILO with its international programme on the elimination of child labour (IPEC), and UNICEF) are joining the world campaign to stop the abuse of exploited children. The most recent example is the 'International Child Labour Elimination Act' introduced by Chris Smith, the chairman of the subcommittee on international operations and human rights, committee on foreign affairs, US House of Representatives, and his co-sponsors, representatives Hyde, Lantos, Moran, Kennedy and Ro-Lehtinen. Introduction of the proposed legislation is a courageous first step which deserves to be applauded and needs more public recognition.

The act offers concrete solution to eliminate child labour. If enacted, it will prohibit importation into the US of products manufactured in countries and industries that use child labour; it will also require that the US representatives to multilateral lending institutions oppose loans and other subsidies to or for any industry in which child labour is of use; finally, it will authorise the appropriation of a \$10 million contribution in each of the next five fiscal years to the IPEC programme of the ILO. Clearly, the act will be the starting point for concrete steps to be taken by the world community to improve the lives of million of working children.

In addition, American import industries and multinational corporations could join this effort by requesting that regular monitoring conducted by local labour inspectors take place to insure that child labour is not used in any phase of product fabrication. Global corporations could also establish, with the help of community based organisations, an education fund to give scholarships or establish basic education projects for children of the poorest workers. These projects will not only give them a good-will image but will also build a trusting relationship with workers who can inform the educators without any risk for their lives or the lives of their children whether child labour is used in the factories.

Independent monitoring systems established by non-profits can ensure that children

are not being exploited in World Bank financed projects or as a consequence of those projects. Monitoring can work in the private export sectors. But to implement effective monitoring international organisations, ILO, UNICEF, and the World Bank must channel funding all the way to the grass roots level which is unfortunately not often the case.

However, as Congressman Smith, aptly noted during a recent hearing: human rights work is a lonely and difficult struggle. The supporter of child labour are still resistant to change. They have several arguments in favour of child labour.

The first one is that if children do not work, they will starve. This argument fails analysis. Children can avoid starvation by working a few hours a day for survival. But when the work amounts to 8 or 10 hours a day, in terrible conditions, at half the cost of what an adult would be paid for the same job, it is not work any more but child exploitation. Kailas Satyarthi, the founder of the South Asia Coalition of Child Servitude, pointed out that child labour is the cause of poverty, not the result. There are 55 million child workers in India while 55 million unemployed adults are looking for jobs.

The second argument is that if these children are prohibited from work, they will move to even more terrible conditions such as the sex industry. This argument is refuted by statistics. According to the latest and conservative estimate of ILO, there are 73 million children under 14 years of age who are being exploited in the world. But child labour experts think that there are more than 200 million. It is unlikely that all these children will move towards the sex industry if governments join together to ban child labour. The sex industry is not as profitable as many of the exports industries where child labour is in practice. It is also more visible and requires identifiable locations, mainly the red light quarters of cities, which makes it easier to monitor than the so-called traditional craft children factories which are spreading all over the developing world.

Finally, the third argument is a cultural one. Children have always worked in developing countries, and westerners do not understand this traditional cultural aspect of these countries. This argument does not hold water. Indeed, children were part of the labour

force in artisanal and agricultural economies but it was within their families and the workload allowed time to play and to interact with other children. In comparison, today, children are being moved far away from families to toil in illegal factories. Furthermore, child labour increases with international demand in sectors where child labour was not prevalent previously. The seven-year-old children working 10 hours a day making soccer balls in the Pakistani factories are not part of a tradition but of the recent global exploitation of children to meet the international competition and demand for cheap goods.

These arguments, although clearly without merit, nonetheless have some impact. Global development institutions such as the World Bank deny responsibility for child labour and even maintain, as did one World Bank economist that a nation's economic viability correlates with the number of children in factories. The silence of the World Bank in face of this tragic trend is shameful.

US taxpayers, however, can take action in demanding that their taxes do not contribute to increases in child labour. Taxpayers should request their political representatives in Congress to support the International Child Labour Elimination Act which obliges the Bank to incorporate a child labour policy in its financed projects.

An analysis of several countries with serious child labour problems is instructive. In India, child labour is a national tragedy. In the state of Tamil Nadu in south India, the number of children who are working in exploited situations is estimated by UNICEF to be 1, 105,586. In the match and firework factories, there are about 50,000 working children between the age of 7 and 14 years where more than 50 per cent of India's matches and 70 per cent of India fireworks output are made. The children's main work consists of filling boxes and dipping sticks in chemicals. After several years of factory work, children suffer from various diseases. Neera Burra, a child labour expert, noted in her most recent book, *Born to Work: Child Labour in India*, that the owners of factories prefer children over adults. Not only are the children cheaper but they do not complain as much. Child labour in the match factories of Sivakasi is carefully controlled by the owners who hire contractors to awake the children as early as 3 a.m. to 5 a.m. Because many children come from as far as 30 kms, the children are loaded on buses belonging to the factories. Contractors who transport the children are also the ones who make sure that no outsiders come to cause trouble.

In the lock factories of Aligarh, Uttar Pradesh, about 10,000 children daily toil in terrible conditions. According to Joseph Gathia, the executive director of the centre of concern for child labour, who has established an evening school for working children, 80 per cent of India's locks are made in Aligarh district. The children, who are between 6 and 12 years old, worked on

the bare ground for an average of 9 hours a day. They wear no protective devices such as masks, glasses or gloves; their bodies and faces are covered with dust to such an extent that it is not possible to see the white part of their eyes. To evade the provisions of the factories act, the lock industry has been smartly transformed into a 'cottage industry' with less than 10 workers on each site. Children are paid according to a piece-rate method. After a few years of toil, children suffer various diseases like asthma, bronchitis, TB, skin diseases, ear and eye problems.

In Himachal Pradesh, along the hilly roads of the Himalayas, children engage in manual work of road construction. As the children work, they breathe the polluted air caused by passing trucks, buses, and boiling tar. Yet, someone with very little money, Lama Gondup is trying to improve the lives of these children. No one agrees on the exact number of children working at cutting stones along the roads or working in quarries. According to the Census of India (1981), there are about 23,532, but local activists give a larger number.

In spite of this sad reality, without any child labour provisions, the World Bank is financing a project, with a IBRD loan of US \$95 million for the construction of 800 km of major roads in Haryana state. No one can deny that roads must be improved in India, but it is certain that children be working on road construction activities as a result of this project.

In Rourkela, Orissa, Dr Patra, director of the Asian Workers Development Institute, estimates that there are about 300 children ranging from ages 8 to 15 who work behind the steel plant of Rourkela. The place looks like a living hell. Children hold iron hooks, or hammer to pick up burning pieces that they sell to subcontractors. They are paid on a piece-rate basis. The children work from 4 a.m. to 5 p.m. They work outdoors in the burning sun and breathe the acrid smoke from the plant. There is no drinking water or toilets near by. Many of the children come from tribal families who have been displaced by the effects of modernisation. The plant management denies any responsibility for the working children; they are not employees and they are outside of the plant's boundaries. Patra mentioned also the mines in Orissa where the same facts are replayed: children are working in the backyards of the mines, officially the management can rest in peace, there are no children working in the mines.

According to the latest estimates from UNICEF and ILO, there are about 44 million working children in India. Indeed, the largest number of the world's working children are found in India. In Orissa alone, the number of children under 14 years of age who works in exploited situations is estimated by UNICEF to be 6,17,351. In their study on child labour in Cuttack city, the former capital of Orissa, B.N. Mishra and P.L. Mishra from the department of labour welfare, Utkal

University in Bhubaneswar, Orissa, reveal that the total population of child workers in Cuttack is 33,443 among whom 3,600 work in mining and quarrying and 1,500 work in construction. Most of the children work at least eight hours a day.

In spite of these facts, the World Bank is currently financing two important projects in Orissa in which child labour will be stimulated: first, the India-Orissa water resources consolidation project, which gives a loan of US \$290.9 million to the government of India from IDA credit; and second, the coal sector environmental and social mitigation project which is granting US \$500 million to Coal India to open or upgrade 33 mines in Orissa, Bihar, Madhya Pradesh and Maharashtra, and an IDA credit of US \$50 million for financing environmental and social impact action programmes. In both cases, legitimate development needs are met but should it be at the expense of child labour? Little hands will be working in the construction of the Naraj barrage ('dam'). The barrage is going to replace old Naraj weir which has been damaged by the flood of 1982. It will be 940 metres long and would require 13,000 cubic metres of earthwork and 3,20,000 cubic metres of concrete. This will offer a good opportunity to destitute working children in Orissa who, write Mishra and Mishra, are known to work at cutting stone, brick making, canal digging, road construction. Tribal children will no doubt be found working in the backyard of the new mines of Coal India which is going to displace 10,445 persons (many of whom belong to the oldest tribes of India). A resettlement and rehabilitation policy and an indigenous peoples development plan are provided in the package deal. Coal India will provide employment for 18 per cent of the displaced persons and the remaining 82 per cent (7,549 persons) will be entitled to assistance for self-employment with the help of five NGOs selected by Coal India. The four states where the mines are going to be located are known for their large numbers of working children. Furthermore, child labour experts have found that the majority of working children are to be found among the displaced and migrant families at construction sites, brick-kilns and mines.

Not only do some World Bank-financed projects contribute to the growth of child labour but industries which rely on child labour are given as an example of success stories in a World Bank discussion paper. The fact that India has become the largest exporter of cut and polished small diamonds, is described as a success because, as noted by the authors, India's large pool of low cost artisans gives it a strong competitive advantage. No field study was made to verify who were some of these artisans. There are about 13,600 children below the age of 14 years old working in the gem polishing and diamond-cutting industries according to Neera Burra who pointed out in her book that child labour was not prevalent in these

industries before the international demand for gems increased.

In the same World Bank discussion paper, the authors praise Bangladesh's successful garment exporting and the fact that about 90 per cent workers are female. But, according to Pharis Harvey, the executive director of the international labour rights education and research fund, there are about 3,00,000 children working in the Bangladesh garment manufacturers. These females, often girls eight years of age or less, work like slaves.

The Bank's South Asia external affairs' response has been that "project execution, however, is the responsibility of government agencies." The World Bank is in a state of denial about its responsibility in this regard. The Bank does not even comply with article 32 of the UN convention on the rights of the child which states that every child has a right "to be protected from economic exploitation." The Bank, which is aware of the problem of child labour is increasing its funding in early childhood education. Such funding is an excellent initiative but it must be extended to the middle school years to prevent the massive drop out of nine and 10 year olds from destitute families.

Solutions to end the growth of child labour in the world are not easy. Solutions have to be global and comprehensive in order to reach all levels of societies in which child labour is in use. Americans should support the courageous bi-partisan leadership of Congressman Smith and his co-sponsors and express their support for the International Child Labour Elimination Act. Let us hope that their efforts do not remain isolated in the political arena of Capitol Hill. By publicly acknowledging that child labour is a world evil and including this issue in their political agenda, both presidential candidates, president Clinton and Bob Dole can show the world how much they love children. Their respective solutions may differ, but taking a stand is better than non-commitment. Child labour deserves more attention from Americans because it affects them directly: taxpayers contribute to the World Bank-financed projects which promote export industries in the developing world at any cost, including child labour and which implement large infrastructure and energy projects which generate even more child labour. Child labour affects also the morally concerned consumers who do not know and cannot know which products are free of child labour.

Presidential candidates can convince the world that to a global crisis, a global response is needed. It will take a worldwide effort to fight child labour. Without the interest and intervention of the US the problem will not go away. Americans should stand up against the silent dehumanisation of globalisation. American leaders and international development organisations must take the lead to insure that the precious gift of childhood which is endangered for many of the poorest children in developing countries, be protected in every corner of the globe.

Jiang Zemin's India Visit

Alka Acharya

The almost exclusive focus, in our response to Jiang Zemin's presidential visit to this country, on the power equation and on China-Pakistan nuclear and missile collaboration and its implications for India and, correspondingly, the neglect of the commercial and economic potential of India-China relations – all these reflect our lack of a coherent, long-term China policy.

THE first every visit to India by a Chinese head of state in 47 years of India-PRC relations naturally generated a wide array of opinions and analyses, ranging from those who have hailed it as a historic visit to those who have written it off as yet another dismal demonstration of Indian diffidence or passivity and those who have pronounced the verdict that India has once again sold out to the Chinese. While these assessments obviously arise from specific sets of expectations and perspectives, there are some aspects which have not been sufficiently highlighted; indeed they have been virtually glossed over as by and large either irrelevant or inconsequential.

For a presidential visit, Jiang Zemin's arrival in India was somewhat downplayed; in overall terms, this was certainly a rather low key affair. The Chinese media gave far more coverage and prominence to Jiang's south Asia visit. Interestingly, the references in the Chinese media specified Jiang Zemin as the general secretary of the Communist Party of China (CPC) and not so much as the president of the PRC. This may provide an indication of the relative importance of Jiang Zemin in the domestic context. The transition to a post-Deng era in China appears imminent. As Deng Xiaoping's chosen man, with the additional qualification as chairman of the Central Military Commission (CMC), Jiang has been consolidating his position at the core of the third generation leadership. This seems to be supported by the outcome of the recent Sixth Plenum of the Fourteenth Central Committee of the CPC. Fresh from the APEC summit at Manila and a 90-minute meeting with Bill Clinton there, with his 'tough' speech at the 50th anniversary of the UN in New York last year still fresh, Jiang Zemin appears to be acquiring a firm external profile as "the man most likely to lead China into the twenty-first century".

From the Indian point of view, the downplaying of the visit seemed to be the logical reaction of a diffident coalition government. In its desire to appear firmly in control, the Indian government appeared rather anxious to avoid any outburst of opposition or anti-Chinese demonstration, which would be a normal enough occurrence

in a large democratic country. The visit had to be handled not just at the bilateral level but also, in a sense, at the domestic level – that is to say, due cognizance had to be given to the impact on and reactions from parliament, intellectuals/think tanks and the people. There seems to be a dual aspect to the general perceptions regarding China in India: while on the one hand, there seems to be admiration for the Chinese economic progress, on the other, there is a deep-seated suspicion of the Chinese motives. Thus, while India's China policy is characterised by a subordination of the territorial aspects to the economic, till the "time is ripe" for settlement, it has to steer clear of any impression that this country is bowing to the Chinese dictates.

The focus on the bilateral issues has tended to bypass the fact that the Chinese have a distinct regional understanding/dimension within which India-PRC relations are located. The Chinese president's visit was thus not just to New Delhi, Islamabad and Kathmandu in that order, but to the south Asian region, the first two stops being of equal duration. Whether this indicates merely the intention of an even handed approach to the region, it certainly makes no case for according India-PRC relations any primacy or special status. The reassurance, if any, was intended for Pakistan, since the changes in the Chinese attitude towards the problems of this region went, in a manner of speaking, against Pakistani interests. Consider the following: One, the PRC has been notably mild with regard to India's stand on the CTBT. Two, China voted against Japan, in support of India's bid for a non-permanent seat in the Security Council. Three, for sometime now, the Chinese stand on the Kashmir issue has been undergoing a shift. During Jiang's visit, this change was stated clearly, with the hope that India and Pakistan would settle all their outstanding disputes through "amicable negotiations". What is more interesting is the statement Jiang made in Islamabad regarding the problems in the region generally, without specifically mentioning Kashmir. The customary diplomatic tribute that Pakistan has received from the PRC on virtually every occasion – arising out of their special relationship hitherto – which has been an

important component of Pakistan's strategy to score points against India, viz, the Kashmir issue, was given a miss on this visit. On contrary, Jiang Zemin advised the Pakistanis that in the interests of imparting normalcy to bilateral relations, controversial and contentious issues should be "temporarily shelved" or frozen, as it were, till appropriate time. In the meanwhile, it would be more useful to get down to business. Pakistan must not have liked this at all.

Now this is not only a complete turnaround on the Kashmir issue, but may well signal the beginning of a new era in China's south Asia policy. Further developments are needed to confirm this and one may speculate the reasons for this change, particularly in the light of the stand that the US has taken. But the other interesting thing about this position is that it echoes the stand that the Chinese appear to have adopted with regard to the disputed Paracels and Spratly Islands in the South China Seas. There as well, the Chinese approach seems to be characterised by letting matters stand on an 'as is where is' basis, shelving the dispute and carry on with business, reduce tensions and revert to as normal state-to-state relations as possible. A very important component of the PRC's policy towards regional territorial disputes begins to take shape. With this in mind, the recent proposal by Jiang Zemin to Philippines president Ramos to jointly develop parts of the Spratly Islands (claimed by both) does not appear very surprising or intriguing.

With such a background, had the visit to India been a day longer than the other visit, or been accompanied by some more dramatic announcement such as the recognition of Sikkim as a part of India, the import/impact of the visit would have been far more profound. Ever since the 1960s the Chinese policy towards south Asia has been very clearly designed to trim the proportion of India's predominance in the region. The developing extremely cordial and close relations with each of India's neighbours. What is of greater significance is the Chinese behaviour during crisis periods in the subcontinent. Take, for instance, Islamabad where the Benazir government was ousted recently. In Beijing's scheme of things, therefore, although the "friend of China" has been deposed, Sino-Pak ties are of little essence, no matter that it is a temporary government which entertains Jiang Zemin. The argument that presidential visits, like nuclear blasts, are decided much in advance and cannot be changed at the last minute does not obscure the fact that there is a definite message that is sought to be conveyed by both. And that message clearly is that while much is to be gained from improvement in relations, India is certainly not more important than the others – or at any rate will not be accorded greater importance.

The regional dimension in turn gets subsumed in the still larger global perspective which informs the Chinese worldview. The contours of the Chinese worldview were outlined in Jiang Zemin's toast at the welcoming banquet hosted by the Indian president: "... the world at this time is characterised by continued multipolarisation, more vocal calls for peace and development by nations and peoples, growing weight of economic factors in international relations, rising trends of resorting to consultation and dialogue rather than confrontation in settling international disputes and increasing unpopularity of power politics and hegemonism..."

While more exhaustive studies would be necessary, there is enough evidence to suggest that China has been facing a lot of pressure in its efforts to join the WTO and that indeed it has been conceding a lot more than is generally believed. The PRC's tough bargaining posture does mask the extent to which China has compromised on key issues of trade and investment and lowering of tariff barriers. Likewise, in the political sphere, China's unwavering opposition to what it considers interference in its internal affairs highlights the fact that on issues of human rights, political prisoners and democracy, it has been coming under a lot of pressure. The need for a broad forum, composed largely of developing countries, to face up to sustained political and economic pressure from the west, especially the US, is not new in the Chinese global policy. Its intensive interaction and building of contacts among the so-called third world countries has been geared towards that end. South Asia as well becomes an important part of this overall Chinese strategy to forge stronger links with the developing world. It may be recalled that five years ago, during Li Peng's visit, the joint declaration issued at the end cautioned against the "evolving international oligarchy" – a clear reference to US hegemonic behaviour in the wake of the collapse of the Soviet Union. While the argument here is not that a clear-cut 'united front' is being deliberately forged by China, but the developments do point towards an attempt at gathering support from countries with certain common concerns as they all march towards integration with the global economic organisations and institutions.

The visit was thus more in the nature of sustaining Sino-Indian ties that are clearly on the upswing, but the underlying reality is that it is not a relationship between equals, much as India would like it to be so. There is the weight of the humiliation of 1962, "outstanding problems left over from history", as every speech will unfailingly mention, the greater military might of China, its far superior economic progress and achievements and the inarguable greater

international profile of the PRC. This does not add up necessarily to a picture of mutual suspicion and hostility. If anything, the bilateral talks are intended to remove precisely those concerns. The point is not whether India should have done this or that, but whether India is in a position to do this or that. Hardly any point is made by arguing that India has been taken for a ride by China. The cliché about the 'conniving dragon' is surely passe. So is the cliché of the two Asian giants pitted against each other in inevitable rivalry; they are wearing thin in the new world order. This is not to suggest that India should become complacent or defensive with regard to China. With all the arguments regarding India's potential power status, the fact remains that politically, economically or militarily there are definite limits to what it can achieve or wrest from China. Suspicions and fears are not annulled or removed in a decade or two. What does emerge, however, is the lack of a coherent, systematic and long-term China policy insofar as India is concerned.

There are many who have been disappointed with the achievements of Jiang's India visit, since most of the features of the main Agreement on Confidence Building Measures in the Military Field along the Line of Actual Control in the India-China Border Areas were included in principle in the 1993 agreement signed during prime minister Narasimha Rao's visit. It has been said that describing the Agreement as a virtual no-war pact is being overly optimistic since the stipulation in Article One of the Agreement that "neither side shall use its military capability against the other side" refers to the forces in the border areas. Critics also decry the Article which agrees to limit missiles on the border which they say will send the wrong signals all around, particularly in view of our stand on the CTBT. The position can justifiably be taken that there was nothing in the nature of a breakthrough on the boundary question and that simply redrafting some more safeguards into the 1993 agreement and managing border tension by some more demilitarisation leaves the critical issue untouched.

It is to be hoped that by shelving the "problems left over by history" and in the desire to make a fresh start, the lessons of history are not forgotten. No one would deny that the boundary question, given its rather, undefined nature, has to be tackled step by step. But then, it has to be tackled and there should be a long-term strategic perspective in which it has to be tackled and, more important, it has to be perceived as such. Presidential visits are important, useful and necessary on the long and winding road to normalcy – and it is obvious that when presidents come, they have to sign some agreements. One wonders though whether

it needed a presidential visit to sign agreements on the Maintenance of Consulate General of India in Hong Kong or an India-China Agreement on Maritime Transport or Co-operation for Combating Drug Trafficking. The point however is made without any intention of slighting the value of the accords reached.

The virtual exclusive focus in the media on the power equation and the China-Pakistan nuclear and missile collaboration and its implications for India has led to a neglect of the assessment of the commercial and economic potential in the relations between India and China – which is also partly a reflection of the state of India's China policy. Total trade between the two has grown very slowly, and stands at a mere billion dollars annually. Apart from the constraints that are generally mentioned such as the competitiveness of Indian and Chinese trade and the limits of increasing economic interaction in hi-tech areas, the conclusion is inescapable that India has failed to capitalise on the current obsessive Chinese concern – economic development and ever increasing trade and investment. The single-minded devotion with which the Chinese have been pursuing economic reforms for the last two decades, and the quantum leaps in foreign trade, especially border trade with its other neighbours, brings India's rather tardy approach into sharper focus.

In the 100-strong entourage Jiang Zemin brought with him, more than half were persons from the business and trade sector. The Chinese certainly appear to be far more dynamic and purposeful in this regard, whereas the Indians seem to be just waking up to the advantages of business. How much time will it take to really get up and get going is anybody's guess. Of course, this does beg the question whether booming business ties would really change or affect the political relationship, which would continue to be dogged by the controversial areas which the government hesitates to tread. Insofar as this approach once again underlines the necessity of a step-by-step approach to the solution of at the moment intractable problems and to the extent that in this process, over a period, substantial business and not just peace on the border will be at stake, there seems to be the glimmerings of a strategy – howsoever unsatisfactory.

BANK OF CEYLON

MADRAS BRANCH

Schedule 17—Notes forming part of Balance Sheet and Profit and Loss Account as at March 31, 1996

I. Significant Accounting Policies

1. General

The accompanying financial statements have been prepared on historical cost basis except as otherwise stated.

2. Transactions Involving Foreign Exchange

- Monetary assets and liabilities including outstanding Forward Exchange Contracts, are converted into Indian Currency at the year end rates as advised by FEDAI and the resultant profit or loss is also accounted for as per FEDAI Guidelines.
- Income and Expenditure items have been translated at the exchange rates prevailing on the date of transactions.

3. Investments

The Investments have been bifurcated into permanent and Current category as per Reserve Bank of India guidelines. Permanent Investments have been carried at cost and wherever cost exceeds redemption value, the premium is amortised over the period of maturity.

Investments in current category are carried at cost or market value which is lower and wherever market value is not available, guidelines recommended by Reserve Bank of India are followed.

4. Advances

All the advances have been classified as per the Asset classification norms prescribed by Reserve Bank of India.

5. Fixed Assets

- All the fixed assets have been accounted for at historical cost as reduced by depreciation written off.
- Depreciation on Fixed Assets have been provided at 20% p.a. on straight line proportionately from the date of purchase.

6. Revenue/Expenditure Recognition

- Interest income on all advances other than non-performing assets is recognised on accrual basis.
- Commission and Exchange are accounted on cash basis and Brokerage is accounted on accrual basis.
- Expenditure is generally accounted on accrual basis.

7. Net Profit

The net profit disclosed in the Profit and Loss Account is after provision for Income-tax and Interest Tax in accordance with statutory requirements.

II. Notes on Account

- The Branch commenced its operations with effect from 30th October 1995. In terms of the RBI guidelines regarding Prudential Norms and Classification of Asset, all the loans and advances have been treated as Standard Assets and as a result the Income therefrom have been accounted on accrual basis.
- There are only two investments made in Government securities and they have been bifurcated into 'Permanent' and 'Current' categories in the ratio of 23:77. The Investments have been valued as per RBI guidelines.
- All the monetary assets expressed in Foreign Currencies including Forward Exchange contracts have been converted as per FEDAI guidelines in preference to Accounting standard 11 issued by the Institute of Chartered Accountants of India.
- The Inter-Office transactions between the branch and Head Office and other foreign branches are netted off and grouped under "SCHEDULE 5 - OTHER LIABILITIES AND PROVISIONS".
- The Bank has been taking steps to register with the Provident Fund department. Presently the contributions made by the Bank and Indian employees are kept in a separate Current Account in the Bank itself. No deductions on account of provident fund is made from the salaries of Sri Lanka employees.
- No provision for gratuity is made since none of the employees have completed continuous service of five years in India.
- Depreciation on all fixed assets has been provided @ 20% per annum under straight line method proportionately from the date of purchase.
- As per RBI letter Ref. DBOD(M) No. 515/02.05.25/95/96 dated 23 August 1995 with respect to assigned capital, a sum of Rs. 13,89,60,000 has been shown under SCHEDULE 1 - SHARE CAPITAL - item (I). As per the same letter a sum of Rs. 15 lakhs out of the aforesaid amount, has to be maintained either in cash by way of deposit with RBI or in the form of unencumbered approved securities as required u/s 11(2)(b) of the Banking Regulation Act 1949. The Bank has purchased 13.85% Government of India Bonds 2000 for Rs. 15 lakhs for the above purpose and this has been classified under permanent category of Investments.
- Since this is the first year of the Branch's operation, no previous year's figures have therefore, been given.

BANK OF CEYLON

MADRAS BRANCH

Auditors' Report

1) We have audited the attached Balance Sheet of Bank Of Ceylon, Madras Branch as at 31st March 1996 and the Profit and Loss Account for the period ended on that date, annexed hereto.

2) The Balance Sheet and the Profit and Loss Account have been drawn up in accordance with the third schedule to the Banking Regulation Act, 1949.

3) On the basis of the audit indicated in paragraph 1 above we report that:-

Forward Exchange Contracts have been revalued as per FEDAI guidelines and resultant Profit or Loss is also accounted for in the books of Accounts, which is not in accordance with the Accounting Standard 11 issued by the Institute of Chartered Accountants of India.

4) Subject to our observations in Para 3 above, we further report that;

a) We have obtained all the information and explanation which to the best of our knowledge and belief, were necessary for the purpose of our audit and have found them to be satisfactory.

b) The transactions of the branch which have come to our notice have been within the powers of the Bank.

c) In our opinion, proper books of accounts as required by law have been kept by the branch so far as it appears from our examination of those books.

d) The Balance Sheet and Profit and Loss Account of the Bank dealt with by this report, are in agreement with the books of account.

e) In our opinion and to the best of our information and according to the explanations given to us, and as shown by the books of the bank;

1. The Balance Sheet read with the notes on accounts is a full and fair Balance Sheet containing necessary particulars and is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st March 1996.

2. The Profit and Loss Account read with the Notes and Accounts shows a true balance of the profit for the period ended on that date.

Colonialism and Industry in South India

S Ambirajan

Colonialism, Chemical Technology and Industry in Southern India 1880-1937
by Nasir Tyabji; Oxford University Press, Delhi, 1995; pp x+242, Rs 395.

ECONOMIC history does not seem to be a favoured sub-discipline for our bright economists. They prefer to chase the phantoms that dart in the blackboards or attend to justifying/mystifying/berating current economic policy concerns in a historical vacuum. If at all economic history catches their attention, it is only to secure some time series data and torture them sufficiently in their computers to make them confess to a few neoclassical truths. There are other votaries of this sub-discipline who submerge and mangle the whole thing in a mish-mash of ideas from Gramsci, Derrida, Habermas, Althusser, Foucault and the rest. Given this climate, it is a welcome surprise to come across Nasir Tyabji's level-headed foray into the economic past of south Indian industry during the colonial period. Tyabji had already established himself as an authority on Indian political economy through his many scholarly papers and his fine survey *The Small Industrial Policy in India* before the completion of this work which confirms his position as a careful scholar who can fuse economics and history to explain India's recent past in a meaningful way.

If we discount Britain, almost all the developed industrial nations achieved their economic supremacy roughly during the half century preceding the first world war. Again a significant element in the industrialisation process was the part played by the chemical industry during this period. The intriguing question is: Why did India not achieve industrialisation during this period? For south Indians a further query: Why did the south lag so much behind western and eastern India? What could be the reason for the non-development of chemicals-based industrialisation notwithstanding the ample supply of the necessary raw materials? These are extremely difficult questions because even the much easier 'Why did Industrial Revolution occur in Britain?' has no definitive answers despite two centuries of investigation by renowned scholars in three continents. The issue here is all the more complex: why did certain events not occur? Monocausal explanations for the existence or otherwise of modern industrial development cannot lead us to any clear understanding because it is essentially a social phenomenon with many contradictory forces acting and reacting to produce a dynamic process. All that can

be achieved is clarifying the issues, ferreting out facts, laying out evidence, making tentative suggestions and identifying directions where explanations may be sought. Certainly not unassailable causal connections as evidenced by the failure of the 'Cliometric historians' to solve all historical riddles via the route of number crunching.

The merit of Tyabji's work is that it does not pose grand unanswerable questions. Neither does it want to dazzle the reader with a complex set of analytical *pot-pourri*. The objective is modest, as he says in his introduction, his intention is to examine major developments of the industrialisation process encountered in Madras and look at the factors underlying them. The experience of Madras with its pre-independence concentration on textile industry and post-independence emphasis on transportation comes as a surprise because just as Mumbai's industrialisation was cotton-based and Calcutta's manufacturing depended on jute, Madras should have developed chemical-based industries in view of its oilseeds production. A perceptive observer of the south Indian economy, Gilbert Slater, had asserted as early as 1917 that "the great industry for which south India is peculiarly qualified is the oil industry". The puzzle is all the more because the government of the Madras Presidency took more initiatives to develop its industrial potential than the other two presidencies. There is besides the behaviour of the three major princely states, Travancore-Cochin, Mysore and Hyderabad, which are part of the southern economic landscape though with different modes of political decision-making.

There are in all six loosely connected chapters each almost a self-contained essay. The opening chapter covers a vast ground at a general level to give a broad-brush picture of the socio-economic changes that took place since the 1880s, the consequences for the development of a political class, relationship between different economic interest groups and the nature of industrialisation process until the first world war. In the following chapter, Tyabji gives a detailed picture of the origins of chemical-based industrialisation in southern India. The role chemicals play in the development of economies is quite complex. A large variety of chemicals have been used by all early

civilisations including our own. Alcohol, dyes, alum, saltpetre, mercury, acids and alkalis have been used since time immemorial although until the medieval ages without fully comprehending them. Much knowledge of chemicals that the west received were originally from Arab/Muslim alchemists like Al Jabir and Al Razi. Indians and Chinese had understood the chemicals even before the Arabs did. But all these civilisations used chemicals without a chemical science. It was with the development of chemistry as a science in the 18th century and its offshoot, chemical technology in the 19th century that enabled the west to jump far ahead in using chemicals in a large way to industrialise their countries. This was clearly understood by key Madras officials like Chatterton and Nicholson who made attempts to convert the traditional use of chemicals by the infusion of theoretical and practical knowledge of applied chemistry to manufacture things scientifically. Among the key available raw materials were oilseeds and copra, and considerable efforts were made to create a viable industry based on them. Tyabji has analysed all these efforts in great detail and has indicated the results dispassionately. On the one hand, a combination of one set of circumstances helped copra-based industries like soap, whereas another set of factors did not have the same positive effect for other oilseeds. The fortunes of other chemical industries with special emphasis on the printing ink industry during the inter-war period is taken up in chapter 4. Textile and sugar industries are examined in chapter 3 and chapter 5 looks at the light industry in the small-scale and cottage sector. The final chapter concerns itself with the second war period.

The moral of this story is very clear. There are no simple answers to complex problems that have evolved over a long period under a shifting environment. Industrial revolution is not an automatic process and can occur only if a favourable concentration of circumstances is at hand. South India during this period had some favourable factors and many inhibiting forces. Supply factors, demand factors, problems of technology, entrepreneurial behaviour, contradictory interests of the main economic players, international developments, seemingly favourable but really a confused and at times contradictory government policies, and above all the undoubted fact of a colonial regime with its unstated but clear orientation towards securing economic advantages for the 'Mother' country all acted and reacted to produce a combination of circumstances which prevented large-scale industrialisation of south India.

The reader must be warned that this is not a contribution to the economic history of particular industries as such. There is no attempt made here to compute estimates of output, investment, labour force and other economic variables. While it is appropriate that Tyabji has taken south India as a whole for his study, it would have been interesting if he had extended his coverage to look at the fortunes of industrial development in French India for a comparative analysis. Pondicherry had at the beginning of the first war five cotton mills and one iron-rolling-cum-engineering works. All of them enjoyed

the advantage of free trade with British India and a protected market in French colonies such as Indo-China and Madagascar.

Tyabji has set before specialists and generalists alike a wealth of economic information collected laboriously from the Tamil Nadu Archives and elsewhere. The value of this book lies in its documentation of the impact of government policy and examination of the political economy angle of the process of industrialisation. In sum, it is a sound contribution that will increase our understanding of the south Indian economy during the first four decades of this century.

and experimental philosophers of democracy during this century, was an American has been somewhat unfortunate. It does not come naturally to those deeply concerned with expanding the role of the community of ordinary people in day-to-day political decision-making, as a means of advancing democracy, to seek inspiration from a citizen of the most determined and formidable imperialist power in modern history. Yet, it is a fact that Dewey (unlike sociologists of affluent communities such as Dahl) is the most systematic thinker to date on the nature of democracy, its problematic character, and the ways and means by which its dynamic can be realised by every individual and community.

In the aftermath of the creative upheavals of the 1960s throughout the world, a number of contemporary thinkers and activists in the spheres of democracy in politics, education and other areas of life have played influential roles in promoting a new world view of social and political life anchored in democratic ways of goal-setting, policy-making and participation in the lives of communities. The work of contemporary philosophers of democracy and democratic activists owes much to the inspiration provided by the work of Dewey and Peirce, his philosophical predecessor.

Systematic analytical treatment of the relationship between the electoral, substantive and participatory aspects of democracy (in general as well as in the Indian political context) is thin on the ground. Students of politics tend to concentrate on these closely inter-woven strands in isolation from one another rather than as integral parts of the same phenomenon. The distinction I have in mind here is between: (1) Elections as constituting the most elementary and necessary but by no means sufficient condition for the functioning of an effective democracy; (2) substantive democracy constituting opportunities for the people to act institutionally in times of crisis in order to remove threats to the constitutional guarantees of democratic choice (e.g. after the Internal Emergency); and (3) participatory democracy, which goes beyond the institutional confines into the more complex terrain of the mass of the people taking part in politics. In order at least to influence and preferably to play an active role in the shaping of public policy. The tension between the three waves of democratic political activity at the level of the mass of the people – viz, electoral, substantive and participatory – is further heightened by the submergence of large segments of rural and urban population below the poverty line, with struggle as the only means by which they can make their voices heard. The order of magnitude of the sheer numbers involved renders this an all but insurmountable problem.

Creating Space for Change

T V Sathyamurthy

Grassroots Horizons: Connecting Participatory Development Initiatives East and West edited by Richard Morse, Anisur Rahman and Kersten L. Johnson; Oxford and IBH Publishing Company, New Delhi, 1995; price not stated.

THE steady erosion of democratic practice in post-colonial south and south-east Asia has been a characteristic feature not only of regimes in which military dictatorship usurped civilian political power of the state, but also of governments that have claimed to observe constitutional proprieties and to derive their legitimacy from appropriate electoral institutions. In all countries of south and south-east Asia different brands of undemocratic governance have struck root during the last four or five decades.

Yet, during the same period, steady pressure has been exerted by the mass of the people in the direction of evolving democratic practices in their quotidian life and in the areas of activities immediately affecting their livelihood and their culture. Invariably, the tension generated by people at the base of society becoming increasingly aware of their civil, democratic and human rights has been reflected in attempts by the elites (and, on their behalf, by governments) to centralise power and to intensify coercive measures in order to extract ever increasing surplus at ever diminishing cost from the poorest sections of the society.

In the societies of the so-called 'developing' or 'underdeveloped' world, the main internal contradiction is between the centralising agencies of state power and their institutionalisation on the one hand, and on the other, a rising political consciousness among the sections of society (rooted in the localities) that have to bear the brunt of the concentration of power in the bureaucratic, police, military and political-executive wings of government. The structures of power have shown an insatiable thirst for control. In response to this urge, the mass of the people

has developed ingenious forms of civic political resistance focusing attention on social problems of everyday life that they face as a political community. Participatory democracy and democratic participation have come to occupy ever larger space in the lives of oppressed peoples – in India, for example, these include agricultural workers and poor peasants, the urban poor, urban unemployed and urban workers, dalits, OBCs, minority communities (especially Muslims), adivasis and women.

Intellectual and academic critiques of the post-colonial state have, until recently, revolved round broadly radical liberal or some form of Marxist evaluations of its oppressive and coercive characteristics and of its dedication to the task of promoting the interests of the national and comprador bourgeoisie, the commercial petit bourgeoisie, the rural rich, and the 'liberal' professions. A significant feature of all these critiques has been their distance from 'democracy', with the connotation of the mass of the people being at the centre of political action as participating agents of change. During the last 25 years, people's resistance to harmful government policies, in a number of different socio-political economic and environmental contexts, has largely overtaken the concern of intellectuals and academics for deepening and extending the roots of democratic actions.

However, a rich vein of analytic and programmatic insights can be gleaned from a small number of theoretical practitioners who have left an intellectual legacy of democratic thought and action of prodigious proportions. The fact that John Dewey, foremost among the political educational

INDIAN WOMEN IN A CHANGING INDUSTRIAL SCENARIO

INDIAN WOMEN IN A CHANGING INDUSTRIAL SCENARIO

edited by **NIRMALA BANERJEE**

Well researched and presented, this book will be a welcome addition to the library of anyone interested in labour economics and women's studies.

Times of India

Eminently readable... We heartily recommend it.

Management and Labour Studies

Indo-Dutch Studies on Development Alternatives, Volume 5

1991 | 319 pages | Rs 385 (cloth),

WORKERS AND AUTOMATION

The Impact of New Technology in the Newspaper Industry

RANABIR SAMADDAR

A well researched volume containing a wealth of information regarding the process of automation in the newspaper industry... The author aptly identifies how new technology has brought in new issues and how inadequately prepared are the union leaders for addressing these issues.

Productivity

1994 | 268 pages | Rs 388 (cloth)

NEW TECHNOLOGY AND THE WORKERS' RESPONSE

Microelectronics, Labour and Society

edited by **AMIYA KUMAR BAGCHI**

This book is a welcome addition to the limited literature on social impact of new technology in developing countries. A major feature of this book is that it neither tries to explain the microelectronic revolution as an anti-worker strategy nor does it attempt to eulogise it.

Economic and Political Weekly

1995 | 368 pages | Rs 395 (cloth)

WORKER TAKEOVER IN INDUSTRY

The Kamani Tubes Experiment

B SRINIVAS

Lucidly written, informative and serious, the book is recommended for students of industrial management as well as practising trade unionists.

Business Standard

An important source of information on the most celebrated worker takeover in India... Comprehensive in its coverage of the issues.

Business India

1993 | 224 pages | Rs 245 (cloth) | Rs 145 (paper)

LABOUR AND GENDER

Survival in Urban India

U KALPAGAM

The strength of Kalpagam's book is that it is fundamentally based on the perception that gender issues cannot be studied in isolation, but must be located within the overall structural context and the dynamics of the macro-economy... Kalpagam's sanity and balance are admirable.

Book Review

1994 | 308 pages | Rs 295 (cloth) | Rs 195 (paper)

FORMS OF PRODUCTION AND WOMEN'S LABOUR

Gender Aspects of Industrialisation in India and Mexico

I S A BAUD

A useful contribution to our understanding of the position of women in production and of the changes in their work status that accompanied change in technology and production organisation.

Grass Roots Horizons, in a literal sense, and the book of that title under the joint editorship of Richard Morse, Anisur Rahman and Kersten L. Johnson, lie at the meeting point between what democratic activists practise as politics on the ground and how (individually, collectively, and through facilitating organisations, generally non-governmental in character), and those who theorise about democracy as the most creative productive and least socially and economically exploitative of the alternatives available in politics. The book embodies a vision that is at once strategic and practical. It combines the fruit of democratic action as gleaned in concrete contexts with intellectual generalisations and reflection on the wider implications of democratic behaviour. It has addressed the question of method in general and comparative method in particular by drawing together experiences from widely differing circumstances. It is based on exchanges between members of a workshop who have conscientised themselves in an open manner and also made a serious effort to admit the reader into their thought processes. It is certainly a path-breaking effort the seminal character of which is eminently matched by its attention to the why and the wherefore of evolving sound working democratic practices and procedures in ordinary life. Above all, it puts politics of a mutually respecting kind at the heart of its inquiry.

E M Forster's famous injunction "Only connect" is hard to put into practice, but 'connecting' does enrich our understanding of the process of participation more than any other approach. This book is about 'connecting'. It begins with a down-to-earth account of the editors' reflections on their experience of the workshop. The idea of a workshop arose out of an intensive project "together with communities in Bangladesh, Bhutan and Nepal in participatory action research for rural development and energy planning" (p 4), in which the editors, among others, had taken part. The workshop, a ten-day event, brought together participants who work actively with and have won the trust of disempowered, impoverished communities; they were drawn from primary organising groups, and different levels and durations of experience of working with individuals and communities of disadvantaged/marginalised peoples. A third of the workshop members were selected for their academic and professional involvement in such work.

The workshop on 'People's Initiatives to Overcome Poverty' was appropriately set in Honolulu (east-west centre) where the people belonging to the Hawaiian nationality have been engaged in a protracted struggle to regain their rights from the imperialist conquerors from the mainland. The organisers

and participants, representing a wide variety of backgrounds, worked to create "an open decision process in the organisation and conduct of the meeting". Each participant thus had her/his own field to speak from. It served both as a vantage point of one's own experience as well as of comparison and contrast with the fields of other contributors. And the issues arising out of different experiences constituted another vital dimension of any potential consensus that might evolve out of the processes of converging and diverging, revolt and bonding.

The substantive base for the task attempted in the workshop was provided by 15 case profiles representing major experience in participatory action to overcome poverty in India, the Philippines, the US, Canada, Thailand, and Bangladesh. In the Indian case, for example, Varun Vidyarthi focused on the root cause of poverty. To view poverty from a purely economic angle without tackling the dependence trap in which the poor are caught was counterproductive. Structural factors were important and struggles against poverty necessarily involved the development of alternative (in the case of *Manovadaya*, 'dharma-centred') institutions.

The report of each field worker evoked lively responses from others with different experiences. The dynamic of the interaction is brought out in a dramatic, an almost Socratic, manner in which participants raised questions linking their different field-based and issue-centred experiences, and identified resonances between them. To enable the readers to sample the discussions in the workshop, I quote here one of the many remarkable exchanges following from the account of the various projects at Waipa on the island of Kaua'i aimed at arousing people's political consciousness of exploitation and deprivation:

Puanani: But why is *poi* [an Hawaiian staple] so expensive?

Syed: Hawaiian culture, as you say, values sharing. Here we have Filipinos, Chinese, Caucasian. Where do you draw the line? What are the linkages, coalitions?

Danell: We face this question every day. Outside people come in. For example, an architect from the mainland. A whiz. We have helped him. We don't love other people any less, but feel we have to have control. Puanani: Princess Pupule, who some thought to be crazy, said 'Give away fruit, but hang on to the root'. This is an incredibly difficult question. Doesn't sharing extend consciousness? Is there a link between being racist and preservationist? Not a line, a sense, a feeling. If I don't like what is being said, I would leave. For other people there is no line. When you feel respect, you give respect back.

Tony: That is one of the best answers I have heard (pp 40-41).

Building on the intensive discussion of the workshop, a synthesis statement was formulated. This embodied "middle level generalisations" on (i) goals and direction, (ii) analysis of the problems, and (iii) scope and strategies for action. The methodology of the workshop was unique. Substantive material gathered by different workers – activists, academics, and catalytic agents in the form of organisations with newly conceived remits – discussed in a psychologically/emotionally related atmosphere which placed a premium on democratic openness (*à la* the Deweyan paradigm), has not only enlivened the book but also enriched the quality of its contribution to our understanding of development. It is a relief to come across a book conceived and brought forth in the contemporary American academic milieu that has refrained from beating the drum and blowing the trumpet of 'good governance' (whatever that may mean), and has unreservedly centred itself in the lives of the poor, the marginalised, the disempowered and the disinherited of the world.

Parts II, III and IV deal with the field material of the participants in the light, respectively, of the themes of identity and solidarity; building spaces to transform the structures; and transformations the compass round. Part II consists of six chapters based on work in the Philippines (on the role of the foreign missionary), Labrador and Newfoundland (on single mothers uniting against poverty), Thailand (on the identity of the deaf and the paradox of difference), and Bangladesh (two chapters: one on initiatives in cultural renewal and actions based on grass roots communication; and the other on an alternative development programme with a radically re-defined role for the state based on practice preceding theory and not the other way round). The general conclusions of Part II emphasise the unifying role played by identity, awareness and joint action. When they are suppressed they lead to paralysis. When they are activated and awakened they show 'life building strengths'. The editors reflect on the discussions aroused by the material under the general headings of "facilitation, insider-outsider relations, autonomy of local groups" and, significantly, of the stimulus provided by the success of these arousals for widening and deepening participatory action.

Starting with editorial reflections on the task of creating spaces in order to change the structures (people-oriented 'knowledge structures' that respect culture, to replace or contend with received hegemonic ones that ride roughshod over culture), the four chapters of Part III deal with (a) the successful innovative LAKAS-ODISCO movement's approach to sustainable and holistic development; (b) the development of self-reliance among the rural poor in Uttar Pradesh

(*Manovadaya* acting as a facilitator in the field); (c) the case of Evergreen State College as an example of a new model of higher education based on a native American community-determined programme; and (d) an imaginative report of an American on her intellectual and epistemological Odyssey in search of a new paradigm of social change necessitating coalition-building in diversity, and the problems involved in networking with American groups in order to build bridges with the people of Thailand (in this example) that cut across imperialist prejudices. Of the issues that the editors draw out of this section, the most interesting is that relating to the "enigma of retaining the solidarity that is face-to-face, but building coalitions on a larger scale that still retain the essence of that trust, of those purposes, and can therefore really be empowering against the larger structures" (p 265). The main theme of Part III is the strategy that is best suited to participatory development, and it is in this sense that the editors deal with issues relating to counter violence versus non-violence, rights, and autonomy.

Building directly on issues developed at the Rio de Janeiro summit, the contributors to Part IV focus on (i) the role of NGOs in Bangladesh with special reference to the environment and democratic processes; (ii) an account of the behind-the-scenes work involved in the 'Forests for Life' project in Thailand connecting together, in its designing, villages, and grass roots teachers and researchers; (iii) a discussion, on a global level with a focus on more equitable or less inequitable 'terms of trade' in food between the north and the south, of the requisites of "locally based, ecologically sound, and socially innovative development"; and (iv) a statement of "some values and principles underlying socially just, sustainable development". The 'editorial openers' to Part IV attempt to deal with the importance of changing the terms of discourse from poverty reduction to universalisation of equity, and of the need to move inward in the large spheres of the world (east, west, north and south) on the as yet uncharted journey of recovering control over assets (i.e., natural, social and ecological assets that have been mortgaged to rapacious developers, prospectors and guzzlers of capital). Noticeable throughout the discussion, sometimes as an undercurrent and at others in a more self-conscious sense, is a tension between philosophical and theoretical assumptions on the one hand and on the other the primacy or 'working within a particular context' in the awareness that the sets of questions and sets of action will vary from context to context, level to level.

It is only appropriate that Puanani Burgess, a poet and host to the workshop

with a heart even larger than her head, should have the last word on the transformation in which five and a half years of co-operation resulted:

In reflecting back upon those days, I have concluded that there is a deep place, where we seldom visit and are seldom asked to visit or act out within the context of a conference or workshop, where we as participants in this workshop had to go in order to find common ground and to be able to be productive during these days we had to be together. This is the place where our true values live (pp 370-71).

It is hard to exaggerate the merits of this innovative project. This book is one of the very few in the field of development studies which puts the people at the heart of its subject matter. Its methodology is refreshingly original and multi-disciplinary,

with great depth and potential. The project concentrates on the task of gaining an understanding of the concrete that is at once theoretically enriching and practically motivated. Its texture is vivid with different deeply dyed colours that leap out to the eye. Implicit in the approach of the participants and the editors is an appreciation of the need for an analytical shift from a paradigm of power centred in the institutions of the state to one that stems from power that people at the grass roots generate in order to achieve the democratic purpose of participation in development. As I read it I enjoyed the atmosphere of trust generated by the participants, a feeling of belonging to the same world as they. Altogether, it represents an inspiring contribution to an otherwise largely uninspired and lacklustre academic field.

REVIEW OF LABOUR

Class Re-formation in Mumbai

Has Organised Labour Risen to the Challenge?

Stephen Sherlock

The labour movement which made an impact on the character of the Mumbai working class in the past is losing much of its capacity to influence class formation at the level of consciousness and struggle. Past successes were the result of determination and sacrifice, but the fruits of this struggle were channelled into organisations which depended on an environment created by the state. While circumstances have changed, there appears to be a reluctance on the part of the trade unions to recognise the limitations of past achievements and to relate to the new Mumbai working class.

THE trade union movement in Mumbai has been among the most vibrant parts of the labour movement in India. As one of the earliest sites of industrial development in India, Mumbai saw some of the first instances of organised resistance by workers to the demands of capital. In the post-independence period, during a time of sustained economic growth, considerable progress was made in nurturing an organisation and culture of class-based activity. Organised labour made a significant mark on the social character and political life of the city. In the last 20 years, however, the economy of Mumbai has been remade. An old city which combined industrial and commercial activities in its physical heartland has been reshaped into a commercial and service centre surrounded by restructured industrial production dispersed to ever more remote locations. In the process the city's labour market has been transformed, reducing the bargaining power of organised and unorganised labour. These developments have had a drastic impact on the lives of working people and have thrown the labour movement in the city into crisis. This paper poses questions regarding capacity of the Mumbai trade unions to respond to the new environment.

Mumbai was initially a centre of trade and commerce, but it also became a manufacturing city from the 1860s with the creation of the cotton spinning and weaving industry. At its pre-war peak in 1925, the industry employed 1,48,000 workers, roughly one in every ten of the city's residents.¹ The inter-war period saw some diversification of Mumbai's industrial base, but it was the second world war which had a dramatic impact on Mumbai's manufacturing, in particular in basic metals and engineering, where employment grew by nearly 150 per cent between 1940 and 1943. Under post-independence autarkic policies a new range of import-substitution manufacturing grew up. Manufacturing made up over 40 per cent of employment in Mumbai into the 1970s, with textiles still accounting for almost half.²

The wave of sustained economic growth in the post-independence period came to an

end in the mid-1960s. Industrial growth on an all-India basis averaged 7.7 per cent per annum from 1951 to 1965, but slumped to an average of 3.6 per cent per annum from 1965 to 1975.³ The generalised crisis forced a period of restructuring for Mumbai's textile industry, as a part of a wider economic and spatial remaking of Mumbai.

The Mumbai textile industry until the 1950s was largely homogeneous, dominated by a relatively small number of mills producing goods of similar quality. From the late 1950s, however, technological backwardness and poor capacity utilisation made many mills unviable, with an increasing proportion of production accounted for by handlooms and powerlooms.⁴ The mill sector became differentiated into old private and state-run units of variable degrees of (non)viability and newer units producing higher quality output. Many mills have also subcontracted part of their production to powerlooms, often in arrangements of dubious legality, taking advantage of lax labour laws and of state support to the non-mill sector.⁵ The New Textile Policy of 1985 allowed for the closure of 'sick' mills, but other legal and administrative impediments have continued to impede many closures.

The differentiation of the textile industry into a backward non-viable sector kept in existence by state policy; a modern profitable sector with expanding investment and production; and a growing small-scale sector, often producing under subcontract to larger units, became characteristic of the entire spectrum of Mumbai industry. During the 1970s and 1980s there was an overall decline in manufacturing in Mumbai city (especially in the textile mills, where employment fell from 2,00,000 to 70,000) but at the same time there were trends to greater specialisation.⁶

Much of the shift from formal sector production to the informal and small-scale sector is part of the process of specialisation. As an example, the loss-making Carona footwear factory in suburban Mumbai was closed in early 1995 because the majority of its output was in cheap canvas and rubber products. In the words of the company's

chairman, it was "difficult to compete in this segment with the unorganised sector". Eight hundred of the 1,200 workers accepted redundancy and Carona was reported to be looking to establish a modern plant in Mumbai "to cater to the higher end of the shoes market", with the remainder of production to be taken up by its existing plant in Aurangabad (*Business Standard*, April 8, 1996). The company appears to have surrendered part of its production to the informal sector, and to have reorganised its own output without necessarily relocating all of it outside Mumbai. Similarly, Hindustan Lever moved production of its high-volume low-value goods to plants outside Mumbai, much of it carried out by subcontractors, while at the same time retaining high-value production in the city because of the superior resources of skilled labour (interview with Bennett D'Costa, secretary, Hindustan Lever Employees' Union, Mumbai, January 1996. Interview with Irfan Khan, Communications Manager, Hindustan Lever, Mumbai, January 1996). Subcontracting has also extended to new public sector infrastructure such as the Nhava Shiva and Kandla port facilities, where many functions performed by regular employees in older ports are handled by labour contractors, with the latter reported to have half its workforce employed in this manner. (*Business Standard*, September 7, 1992).

Much of the process we are witnessing is not a de-industrialisation of Mumbai, but a spatial reorganisation, combined with an ever-increasing territorial expansion of the effective economic boundaries of the city. Thus the central (southern) areas of the city have become less important as manufacturing centres, and production has moved out into the suburbs, and to satellite centres such as Thane, Kalyan and Navi Mumbai. Other production is moving still further to nearby cities such as Pune and Nasik. The older precincts have instead become increasingly devoted to Mumbai's burgeoning service industries, including finance, tourism, retailing and entertainment. Mumbai is becoming, like most large cities in the developed world, one based on services and the

flow of information, with dispersed manufacturing located in specialised areas.⁷

A RE-FORMING WORKING CLASS

The restructuring of production in Mumbai has naturally had profound effects on the labour market and on the bargaining power of workers in the city. The relatively uniform labour market of the past is being replaced with diverse characteristics. The relocation of manufacturing, the rise of the small-scale and informal sectors, and the increased importance of service industries has significantly lowered the ability of most workers to improve their living and working conditions or even to defend existing conditions. On the other hand, smaller numbers of workers have benefited from the growth of specialised services and manufacturing.

The extent to which these changes were consciously undertaken by employers with the specific intention of undermining the power of organised labour is a moot point. Jairus Banaji of the Union Research Group argues that manufacturing is relocated to escape unionised labour and to take advantage of 'first generation' workers for as many years as possible before, presumably, moving on to reserves of unexploited labour still farther afield.⁸ The level of unionisation even within well-established industries in the city is, however, not so great as to make unions the prime cause for relocating, although this would be a factor in some instances. Relocation is part of capital's efforts to maximise profits by reducing the overall costs of production, including but not confined to, the costs of paying and controlling labour. Remote areas are also attractive because of cheaper real estate, government subsidies, less congested services and so on. As far as labour is concerned, the net result is not only to provide new sources of cheap labour, but by extending the geographical limits of the Mumbai labour market, downward pressures are created on the price of labour throughout the entire city. By expanding into new labour markets, capital reshapes conditions in existing ones.

There are now fewer jobs in the formal sector of manufacturing and services, and an increasing proportion of new jobs are being created in the informal sector. Even the new jobs that are in the formal sector are usually in plants which are smaller than would have been the case in the past, and they are not likely to be clustered together with like industries in the manner which characterised the old textile mills. In the days when textiles dominated Mumbai's industrial scene, the concentration of large number of workers in a single plant facilitated union organisation. Union leaders could contact a large number of workers at the one time and messages about meetings, rallies or strikes could be

passed quickly through a plant by union activists. Similar conditions prevailed in large-scale services such as the ports, transport, government utilities and departments, and in the majority of engineering, chemical and other manufacturing plants which grew up in the 1950s and 1960s. Organising in many other service industries and the informal sector was always a difficult task, but the manufacturing workforce provided a core of organised strength to the whole labour movement.

The dispersal of manufacturing has made conditions for labour organisation much more akin to the informal sector. Workers are scattered in many small sites, under the close supervision of managers hostile to unions for reasons, at best, of paternalism, and at worst, of sheer rapaciousness. It is a commonplace of industrial relations that smaller workplaces facilitate easier labour control and that smaller employers are more likely to resist unionisation. This has always been an issue for many service sector workers, such as in the commercial sector, hotels and the film industry, and the growing predominance of services in Greater Mumbai makes this a reality for increasing numbers of workers in the city and suburbs. In the case of workers employed by subcontractors, it is not only difficult merely to locate the myriad of obscure backyard sites, but the complex and often illegal chains of production frequently make it nearly impossible to determine who is really the employer. Production in such sites can quickly move at the first sign of a union organiser or government official.

The dynamic is, however, not all in the one direction: the labour market is becoming much more diverse and desegregated. While many workers operate in a labour market paying barely subsistence level wages and in appalling working conditions, the other end of the market pays wages and provides conditions which are the best in the country and which sometimes approach international standards. Workers at the higher end include those in the modern export-oriented textile mills, in plants devoted to the production of high-value goods, in highly-skilled technical positions and in certain parts of growing sectors such as finance. Many such workers are employed by international corporations or industries tied into the international market. Of course, greater numbers are likely to be found towards the lower end of the spectrum, but the days when labour was synonymous with the textile workers are long gone. Many of the commonalities of working class experience have been eroded.

The Mumbai trade unions constitute probably the oldest and most well-established wing of the labour movement in India. Conditions for organisation have never been ideal for the Mumbai working class as a whole, but whole segments of workers in

major industries have had a long history of involvement in unions. The labour movement in Mumbai today, however, can only be described as being in a state of crisis, with levels of unionisation at a very low point and lockouts outnumbering strikes since the 1980s. The material circumstances which account for this crisis can be found in the restructuring of the Mumbai economy and the reshaping of the city's labour market described in the sections above. The following discussion argues, however, that the origins and structure of the Mumbai labour movement have contributed to the erosion of its strength and its inability to adapt to the changing nature of the city's labour market.

Organised labour in Mumbai emerged as a significant social force at the close of WWI, with a series of strikes in textiles and other industries which continued until the defeat of the 1934 textile strike. The unions were insubstantial bodies to which workers flocked during strikes and which tended to dissolve as effective organisations soon after. Unions associated with the Communist Party of India (CPI) suffered from repression, but the strategy of the colonial state was combined with paternalistic co-option. Left-wing, 'reformist' and 'non-political' unions were all undermined by the passing of the Trade Disputes Conciliation Act in 1934 and the subsequent appointment of labour officers to investigate workers' grievances and mediate in disputes.⁹ At a time when the depression made conditions unfavourable to labour, such intervention by the state could often achieve more obvious benefit to workers than was apparently possible through unions.

As we shall see, this close state involvement in labour relations established in the final years of colonial rule was to set the pattern for post-independence Mumbai. The response of the trade unions to their embrace by the state was to have major implications for their future development. CPI unions gained strength during the second world war because the Party supported the war effort and discouraged strikes, a position which won it sympathy and even support from employers and the state. The absence of Congress leaders from the labour scene because they were imprisoned or underground due to the Quit India movement gave unions led by the CPI and the Royists (followers of the former Communist, M N Roy, who also supported the war) the opportunity to gain an organisational foothold.

The situation was reversed after independence when Congress labour leaders gained the support of the state and the CPI was again pushed to the margins of the labour movement. The CPI's apparent strength proved hollow when the buttress of state support was removed. Congress, on the other hand,

bearing the immense prestige of its leadership of the national movement, used its close identity with the post-independence state to establish a base in the working class movement. In Mumbai their efforts were naturally aimed at the centre of the city's working class – the textile workers. In 1947 Congress activists established the Rashtriya Mazdoor Mill Sangh (RMMS) as part of a generalised Congress campaign to imbue the whole Indian labour movement with Gandhian principles of co-operation between workers and employers.

The RMMS soon gained the reputation for being what van Wersch aptly described as 'the type of union employers call 'responsible' ...'.¹⁰ Unable to garner lasting support in the face of competition from the Socialist and Communist unions, the RMMS's influence in the textile industry was based mainly on its status as the sole representative union recognised under the Mumbai Industrial Relations Act (BIR). The RMMS's connections in the new state government of Mumbai allowed the Sangh to become the 'representative' union, a status which both obstructed effective organisation by the textile workers, but gave the Sangh a key role in labour negotiations in the industry. The RMMS often signed agreements with the mill-owners following strikes it had done its best to undermine. Ejecting the RMMS from what Morris called the 'legal fiction'¹¹ of its representative status has been central demand in most textile industry disputes ever since, including the historic strike of 1982-83.

The BIR Act is the provincial level version of a range of labour relations machinery set up in the final years of British rule and incorporated into the legal armoury of the independent Indian state at the central government level. The Industrial Disputes Act of 1947 embodies colonial government regulations drawn up during the war to mediate in industrial disputes and maintain uninterrupted production. It provides for compulsory adjudication in labour tribunals and courts and effectively ties labour organisations into a state-regulated framework. The adjudication system is supposed to provide a minimum level of representation where unions are absent or too weak to bargain effectively. But the growth of a culture of direct collective bargaining has been hindered by the lack of legislation to guarantee negotiating rights to the most representative union in a workplace. The Trade Union Act states that a union can exist with only seven members, allowing a proliferation of rival unions, including employer-sponsored unions, which can take a dispute to the labour court without having any real support in the workplace.¹² Thus the splintering of the Indian labour movement which began

soon after the war, so often blamed on the activities of political parties, was inherent in the legal environment.

The first 15 to 20 years after independence were nevertheless something of a golden age for trade unionism in Mumbai.¹³ The social-democratic/state socialist consensus in Indian political discourse created an ideological environment which was conducive to unionisation, even if the Congress commitment to 'industrial harmony' made it less than friendly to any action outside the official system.¹⁴ Economic growth in India as a whole was relatively strong during much of the 1950s, and employment growth in Mumbai was particularly good as the city's manufacturing sector diversified behind high protective barriers. Mumbai was one of the few industrial centres where collective bargaining made some progress and a range of relatively strong, politically independent unions grew up, particularly in foreign-owned firms, that were able to negotiate settlements on wages and conditions in return for productivity deals. Moreover, when economic conditions began to deteriorate from the mid-1960s, there was the protection afforded by the Industrial Disputes Act banning the closure without government permission of plants employing more than 100 workers. This defended the constituency of many union leaders and obviated any necessity for them to reorganise the same workers if and when they were employed in restructured industries.

FERNANDES AND SAMANT: LIMITS OF HEROISM

These developments gave rise to a number of competing centres of union strength in Mumbai. A particular feature has been union leaders who have established a presence in the Mumbai labour movement through charismatic individual leadership.¹⁵ The two supreme examples of this type of figure are George Fernandes and Datta Samant.

George Fernandes emerged as an important leader in the Mumbai labour movement in the early 1950s, when his tactical flair and brilliant public speaking style gave him a personal profile far beyond the appeal of his Socialist Party affiliations.¹⁶ Fernandes was a central figure in the unionisation of important sections of Mumbai labour in the 1950s and 1960s, but by the beginning of the 1970s the impetus of his leadership was largely spent. The key to understanding the limits of Fernandes' style of organisation can be found in the fact that the main industries where he was strong were in the government sector, including the Mumbai Municipal Corporation and the transport and electricity services. After initially concentrating on hotels and restaurant workers, Fernandes moved on to sectors where employment was

relatively protected and where wage increases could be accommodated in the government budget. Fernandes was unable to make major inroads in Mumbai's growing private sector industries where negotiating conditions were quite different. After being inducted into the national leadership of the major railway union in 1973 (another state-owned utility) and leading the all-India railway strike in 1974, Fernandes' political ambitions took over. He became a minister in the two Janata Party governments, before forming his own party in an ignominious alliance with the BJP in the elections of 1996.

The ultimate flamboyant individualist leader was, of course, Datta Samant, who shot to national and international attention as the leader of the 1982-83 textile strike. Samant's single line of attack was indefinite strike. His militancy and famous contempt for company balance sheets inspired many workers to win major gains during the 1970s, and his efforts were very important in blunting the offensive of the Shiv Sena against organised labour at that time. The limits of Samant's practice were reached, however, in the 1982-83 textile strike. As we have seen, the textile industry had been in crisis at least since the early 1960s, but legislative and political constraints kept tens of thousands of workers employed in mills which would otherwise have been closed or restructured. To launch an indefinite strike in these circumstances provided an opportunity for the employers to restructure the industry by other means. The strike allowed accumulated stocks to be used up, run-down mills were 'temporarily' closed, never to reopen, and production was farmed out to the small-scale sector. While the tenacity of the textile workers during the strike was incredible, the dispute was effectively lost in the first six months, and many workers' sacrifice brought them only unemployment or jobs under worse conditions in the small-scale sector. Like Fernandes, much of Samant's organisational muscle ultimately depended on bargaining power underpinned by conditions created by the state. During the 1982-83 strike Samant tried to push the possibilities of these conditions beyond their limits and undermined his own position – and of more significance – the position of the textile workers.

The textile strike was a watershed for labour in Mumbai. The industry had been the backbone of the Mumbai economy for so long and its workers were seen as the big battalions of the labour movement. Following the strike, however, textile employment shrank by over a half. The defeat of the textile workers was a massive setback for organised labour as a whole and marked the beginning of a new period in which, for the first time since the 1950s, unionisation no longer

covered the key sectors of the Mumbai economy. The strike revealed the extent to which the previous levels of unionisation were dependent on a supportive, even if constricting, environment fostered by the state.

Ever since the defeat of the textile strike, the labour movement in Mumbai has been on the defensive. A new aggressiveness on the part of employers has been marked by the appearance of employers' charters of demands, where bosses have reversed the former culture of industrial bargaining and made continuance of production conditional on the workers agreeing to demands on productivity and staffing. The post-1991 round of liberalisation has contributed to this environment, in particular by making closure of plants somewhat easier. The introduction of the Voluntary Retirement Scheme has been particularly important in inducing workers in many plants to accept closures or workforce reductions. Datta Samant's unions, in particular, have been weakened when, against Samant's advice, workers in his former strongholds such as Premier Automobiles have agreed to accept redundancy packages as a part of restructuring plans.

The unions which have best survived the crisis of the last decade have been some of the politically independent unions in the advanced sector of the Mumbai economy. These unions continue in the particularly Mumbai tradition of pragmatic company-based organisations using the relatively strong bargaining power of skilled labour. They have been willing to enter into productivity bargains to achieve good results in wages, allowances and conditions, but according to critics, often at the cost of jobs. It is interesting to note, however, that the Left unions which long refused to enter into productivity deals have changed their position in recent years.

Activists of such unions tend to be assertive, if not militant in their approach to unionism, but with an instrumentalist rather than an ideological outlook – although some have a background in leftist student politics. Many have, from time to time, allied themselves with party-controlled trade union centres or called in individual leaders such as Datta Samant, but have dispensed with them should they consider themselves hindered by such connections. Independent unions have sometimes enlisted Samant as nominal president of their union, in the hope that the mere association of the name would induce management to negotiate. The workers at Voltas Switchgear in Thane have reportedly joined and left Samant's union on three separate occasions since 1973 (*Business India*, March 29, 1993).

The greatest weakness common to most of the independent company unions is their

extreme sectionalism – the lack of a sense of solidarity with, or obligation to, a wider movement. As skilled workers, members of such unions are often in a position to make gains through their own independent efforts and thus tend to be impatient with calls for solidarity with workers in a weaker bargaining position. Sectionalism can extend so far that employees of some companies in Mumbai have a different union from those in the same company in, say, Calcutta. Of course, large firms such as Hindustan Lever and Philips have been extremely hostile to attempts even to form federations of their company's unions, but one suspects that the workers' own insularity has played a role in perpetuating divisions. The secretary of the Hindustan Lever Employees' Union, Bennet D'Costa, freely admits that his union has made no efforts to attempt to organise workers in the small plants to which their company has subcontracted production. Such major omissions are also a characteristic of the union federations. Vivek Monteiro of the CITU is of the opinion that the tasks involved in organising in the dispersed small-scale sector are in principle the same as in large plants, yet there is little evidence that the CITU has made any major efforts to unionise these workers. The situation is certainly not improved when a figure such as Datta Samant consistently opposes efforts to promote cross-union solidarity during strikes (even during the 1982-83 strike) or united campaigns over general labour issues.

The most disturbing aspects of the crisis facing the Mumbai labour movement has been its subversion by clientism, corruption and even organised crime. There has long been a current of patron-clientism in the Indian union movement in which union leaders act as 'big men' who use their political or other connections to broker deals with employers and take money from workers seeking favours or resolution of individual grievances. This has been facilitated by the legal structures of conciliation and adjudication which provide openings for the arbitrary intervention of politicians in favour of the unions they sponsor. The RMMS is the most extreme example of this phenomenon in Mumbai.¹⁷ Its power was boosted by the legislation restricting the closure of mills which effectively gave the RMMS the power to authorise their shutdown. The RMMS has allegedly signed hundreds of secret agreements with millowners since the end of the textile strike allowing the retrenchment of thousands of workers, all presumably with some form of payoff for the union leaders (*Business India*, March 19, 1990). These forms of deal-making and corruption also invite the involvement of organised crime. This was graphically revealed in the case of the millowner Khatau who hired gangsters to take over the local

RMMS branch, but who became embroiled in gang feuds and was murdered. Thus purportedly pro-labour laws have not prevented the loss of thousands of jobs (although they may have slowed them), but have strengthened the grip of corrupt union leaders. It is probably the most pernicious result of the long-standing tendency of Indian unions to rely first on the supportive structures of the state rather than on the collective power of their members.

The next marker along the path towards complete degeneration is represented by the Shiv Sena unions. The first efforts by the Shiv Sena to build influence on the Mumbai labour scene in the 1960s were mainly based on appeals to the regional-chauvinist sentiment of Marathi workers.¹⁸ While such appeals brought periodic electoral success to the Sena, it never built a significant following for its unions, and most of its influence was won by strong-arm tactics which, as mentioned above, were contained by Datta Samant's unions. The resurgence of the Sena after its enlistment into the Hindu fundamentalist Hindutva brigade, however, has enhanced its ability to force its way into workplaces, as it attempted to do during the anti-Muslim pogrom of January 1993.¹⁹ In sites where the Sena has succeeded, the nexus between union boss, politician and criminal seems complete. Promises by the new Shiv Sena-BJP state government to reform the Mumbai Industrial Relations Act probably have the intention of assisting the Sena's unions to carve out further influence in the labour movement, in particular by supplanting the RMMS (although the restructuring of the textile industry has made it less the glittering prize it once was).

The only encouraging side to these developments is that the Shiv Sena apparently still cannot win a following amongst Mumbai workers through open campaigning. Although many workers are undoubtedly affected by the rising tide of communalism inundating the rest of the community, they are still able to recognise and fight for their class interests, often alongside members of different communities.²⁰ The Sena has made little headway in communalising the workplace, even during the worst of the 1992-93 events.

Class formation is a continuous process, not a one-time affair which comes to an end with the establishment of an industrial labour force. Class re-formation is driven in part by the induction of new workers into the capitalist production process, and also by the continuous reshaping of labour market conditions for those workers already selling their labour-power. The common experience of participating in the production process, and its impact on the lives of workers and their dependents, tends to encourage the emergence of a class as a political force with

various degrees of self-awareness. A key element influencing the possibility of class formation at this level is the nature and strength of existing labour organisations as they emerged in earlier periods of class development: that is, whether those organisations are capable of relating to the experience of the newly forming class and of mobilising its potential capacity to exercise power at the workplace or around the state. The past performance of labour organisations is a major determinant of their influence on the future course of class formation and re-formation.

Mumbai is going through a period of restructuring dating from the crisis of the 1960s and 1970s, while also adapting to the post-1991 acceleration of integration into the world economy. At the same time it is losing much of its old character as an unspecialised third world city and is being remade into a service centre specialising in flows of information as much as in the production and movement of commodities. Many of the solidarities amongst workers fostered by an autarkic political economy, a conducive ideological environment and a manufacturing sector dominated by a single large-scale industry are being dissolved without being replaced by a new sense of collective identity. The atomisation of the production process is being reflected in the outlook of workers. As Sandeep Pendse has expressed it:

A chasm has developed between the organised workers and the others... Self-identification as members, however removed, of the working class begins to recede... [The working class's] social and ideological weight exhibits a proportional decline. Informalisation and expansion of self-employment also saps the basis of any occupational or class identity. It leads to a greater atomisation and competition. The exploitative and oppressive nature of the system becomes increasingly invisible. Anger becomes ever more vague and unfocused. Dreams tend to be acquisitive and consumerist.²¹

The labour movement which made an impact on the character of the Mumbai working class in the past is losing much of its capacity to influence class formation at the level of consciousness and struggle. Past successes were the result of determination and sacrifice, but the fruit of this struggle was channelled into organisations which depended on an environment created by the state. While circumstances have changed, there appears to be a reluctance on the part of many unions to recognise the limitations of past achievements and to relate to the new Mumbai working class that is in the process of formation. In concrete terms, there is no alternative to the slow, often unrewarding work of organising in the small-scale sector where the working class is actually growing.

But many labour leaders have become used to the patronage of the nation-state and accept an enfeebled condition so long as their political and personal fiefdoms are protected. Meanwhile, the dynamic of class formation is moving on in new directions and without a re-orientation by the labour movement as a whole there is a danger that many unions will become irrelevant to the experience of workers now being drawn into the changing capitalist production process.

State Intervention and the Working Class Movement

Sharit Kumar Bhowmik

The state has played a dominant role in influencing the course of the trade union movement in India. The fissures which appeared soon after independence developed into what is today the bane of the working class movement, multi-unionism. The state's interventions in regulating industrial relations have, generally, dampened independent workers' initiatives and encouraged inter-union rivalries.

EVEN a cursory examination of industrial relations in India will show that the state, through its legislations and its bureaucracy, exerts considerable influence on the affairs of the working class. This paper attempts to analyse the interactions between trade unions and the state in the post-1947 period.

In the early years the Indian government's industrial policy based on self-reliance necessitated that the working class be induced to accept the new pattern of industrialisation. Trade unions were incorporated by the state in order to contain opposition from the working class. The state's presence in regulating industrial relations had at times favoured the workers especially when it tried to protect them from the unscrupulous dealings of the employers. However its continued and dominating presence has affected the development of the working class movement in general. The autonomy of trade unions is diluted as they tend to depend on the state to sort out their problems with the employers. Moreover, the state is also able to manipulate trade unions when it wants to favour the employers. We shall attempt to analyse this process in the course of this paper.

Trade unions as organisations of labour were born out of the industrial revolution and originated in England. In the early stages trade unions were formed to regulate competition among the workers. The industrial revolution had impoverished the British peasantry which was then forced to migrate to the industrial centres in search of work. There was constant competition between low paid workers and unemployed job seekers. If a worker was unwilling to work at a particular wage the employer could find several others who would be willing to work for even less. This competition for jobs depressed the wage rates and provided total power to the employers. While commenting on this situation Friedrich Engels (1973) noted that "this was the worst side of the present state of things in its effects upon the worker, the sharpest weapon against the proletariat in the hands of the bourgeoisie". Workers tried to overcome this competition by forming associations. They did so in the face of stiff opposition from the employers. In fact trade unions were a result of these spontaneous attempts of workers to end competition. They were hence organisations

which were unique to industrialisation as they had no roots in any pre-industrial organisations [Flander 1970].

MULTI-UNIONISM AND THE STATE

The most striking contrast in the trends in the trade union movement before and after independence is that in the earlier period, though there were fissures in the trade unions from time to time, in the latter period splits became the order of the day. The All India Trade Union Congress (AITUC) formed on October 31, 1920, was the first national federation of trade unions. Till the eve of independence it remained as the representative of the working class with all shades of ideologies, ranging from communism to liberalism, under its umbrella. It underwent splits on ideological grounds but these differences were sorted out and from 1940 onwards it remained united. The situation changed drastically after independence.

During the last few years of British rule the communists gained considerable control over the AITUC. Soon after Home Rule was declared the leaders of the Indian National Congress decided that since labour would play a crucial role in the new pattern of planned development it could not allow the trade union movement to be led by the communists. The Congress decided to set up another trade union centre which would rival the communist-controlled AITUC's hold over the working class. Thus the Indian National Trade Union Congress (INTUC) was formed in May 1947, a few months before independence. The remarks of Khandubhai Desai¹ who later became union labour minister make the purpose clear. He said, "It is high time that those interested in building up strong trade unionism dissociate themselves from the communists if for nothing else to demonstrate to the world that whatever prestige and status the movement had was because of the efforts of non-communist trade union workers." Moreover it was necessary to co-opt trade unions into the new government's policies hence a new union with avowed loyalties to these policies was necessary: "It is also felt by many active trade union men that the advent of the country's independence, the trade union movement would have to play its destined and legitimate role of influencing the trends

towards the elimination of political, economic and social exploitation."

The formation of the INTUC thus marked the first step of the state in controlling the labour movement. It is perhaps possible to justify this act to some extent as C K Johri (1967: 11-12) has done by arguing that industrial peace is necessary during the period of national reconstruction, especially when there is a consensus that "economic development must take place under the aegis of the government". Johri argues that in such a situation a government of a newly independent country can achieve the purpose of its policy better if the whole or part of the trade union movement is ideologically aligned and politically close to the party in power. However it is necessary to consider the long-term effects of such a policy of state intervention. Usually it is found that though the state may influence the workers' movement with all good intentions in the initial stage its continued involvement does not help the working class movement. We shall deal with this later, but before that let us briefly summarise the course of trade unions after the formation of the INTUC in 1947.

The split in the AITUC in 1947 paved the way for further splits based on the lines of political parties. It has now become almost mandatory for every political party to have its trade union front. When political parties split their trade union fronts also split thus fragmenting the working class even further. When the INTUC was formed the socialist group within the Congress opposed the idea and their unions remained with the AITUC. A year later this group broke away from the Congress to form a Praja Socialist Party which decided to have its own trade union organisation which would draw the non-communist, non-Congress unions together. Thus the Hind Mazdur Panchayat was formed that year. Their objective was partly realised as the M N Roy-inspired Indian Federation of Labour merged with the HMP to form the Hind Mazdur Sabha (HMS). In 1949 the unions supported by the Revolutionary Socialist Party (a Marxist group having influence mainly in West Bengal) which had joined the HMS decided to break away as they feared being swamped by the socialists. They formed their own federation called United Trade Union Congress (UTUC).

In 1952 the Bharatiya Jan Sangh, a political party having a Hindu fundamentalist background, was formed and in 1955 it initiated another trade union centre known as the Bharatiya Mazdur Sangh. In 1965 another socialist party known as Samyukta Socialist Party was formed and its most important trade union leader, George Fernandes, broke away from the HMS to form a new Hind Mazdur Panchayat. However till 1970 the most important trade union centres in the country were INTUC, AITUC and HMS. The split in the Communist Party of India in 1964 which led to the formation of the Communist Party of India (Marxist) split the AITUC in 1970. In that year the CPI(M) formed the Centre of Indian Trade Unions (CITU) which took away a large section of unions with it. The UTUC was also split into two when the unions of Socialist Unity Centre formed another UTUC.

Apart from the working class movement being divided on the lines of political parties at the national level regional parties too started forming their own unions around the late 1960s. The DMK in Tamil Nadu started its trade union centre and when the AIADMK was formed it too set up its own trade union centre. The year 1967 saw the birth of the Shiv Sena in Bombay. In its early phase the Shiv Sena claimed to represent the interests of Maharashtrians in Bombay. It was avowedly anti-south Indian and anti-communist. It formed its own labour wing called the Bharatiya Kamgar Sena. It was widely believed that the Shiv Sena had the backing of some (non-Maharashtrian) big industrial houses in the Bombay-Pune belt to combat the strong influence of communists and socialists in the labour unions. It managed to do so fairly successfully and by the mid-1970s its trade union wing became the largest union in Bombay.

We have presented a sketchy and partial picture of the trade union scenario in the country. However, we can see that the trade union movement which was once united now stands badly divided. That a proliferation of political parties in the country necessarily leads to a proliferation in trade unions will be a simplistic explanation of the situation. There are other reasons for this trend and these are rooted in the nature of labour legislations, the attitude of the state towards labour among others.

LABOUR LEGISLATION: STATE AS ARBITRATOR

On attaining independence from colonial rule one of the main objectives of the government's policy was to achieve a high growth rate. At the same time, if the country was to retain its economic independence it could do so only if the government played

the role of entrepreneur. This necessitated that centralised planning along with the expansion of the state sector become the key factors for the new pattern of growth. In order to achieve these objectives it was necessary to maintain industrial peace and the government thought it necessary to intervene in labour management relations when conflict between the two arose. Thus in 1947 the Industrial Disputes Act was passed. This act attempted to protect the workers by curbing the rights of the employers in arbitrarily firing workers, providing for works councils in factories with over 100 workers and by recognising trade unions as an essential feature of industrial relations. The government realised that industrial peace could be achieved only through protection against victimisation and through recognition of trade unions [Johri 1967: 108]. At the same time the act also provided for conciliation by the government in disputes between labour and management. If this failed the parties were compelled to submit their differences to arbitration. This provision was taken from the Defence of India Rules passed by the colonial government during the second world war [Ramaswamy 1986: 25].

In 1949 two new bills, the Labour Relations Bill and the Trade Unions Bill, were introduced in the Constituent Assembly to replace the existing acts in their fields. The former stressed collective bargaining and settlement of disputes through bipartite

negotiations. The latter provided for compulsory recognition of trade unions by the employers among other features [Johri 1967: 108]. These bills were kept pending till the elections in 1952 when a popularly elected parliament could deliberate on them. The first labour minister of the elected government was V V Giri who had always opposed government interference in labour and he was keen that the bills be passed. They were discussed in the 12th session of the Indian Labour Conference held in 1952. Though Giri wanted labour to be independent of government patronage this view was opposed by most unions, most of all the government-backed INTUC. It was only the communist-led AITUC which strongly supported this stand. In a reply to a questionnaire circulated by the government before the 12th ILC, it stated,

Compulsory adjudication and arbitration in a state based on capitalist-landlord relations, as ours is, will lead to, and positively mean, an open dictatorship over the working class in the ultimate interest of the exploiting classes. It always worsens the conditions of the working class in the final analysis [Ramaswamy 1986: 28].

The AITUC wanted legislation enforcing collective bargaining through compulsory recognition of trade unions [Ramaswamy 1986]. The three other national federations, INTUC, HMS and UTUC, however did not favour a move which would reduce the

government's role in conciliation of disputes.² The ministries too were not keen on any change in the existing laws. They were the majoremployers then and they felt that taking away government regulation would weaken their hold in labour management disputes. These bills were thus never passed and Giri eventually resigned as labour minister [Ramaswamy 1986].

The government's enthusiasm in intervening in labour disputes during the period soon after independence was not totally derived from a need to blunt worker's action against the employers. It also realised that compared to the organised might of the employers the workers were weak and helpless. The government passed a number of legislations covering various aspects of employment. These included wages, bonus, disciplinary procedures, recruitment policies, etc. It also realised that workers on their own would be unable to ensure that laws were enforced. The degree of unionisation in the organised sector was low. Johri's study (1986) shows that it was less than 30 per cent till 1956-57. The government therefore felt the need to intervene through its labour department to ensure that workers got justice.

However, one can argue with equal emphasis that the government's policy was in fact aimed at blunting the worker's initiatives in organising themselves against the might of capital. For example, instead of acting as arbitrator, even if in favour of workers, the government could have passed a law providing for compulsory recognition of trade unions by the employers as the negotiating body for the workers. This would have encouraged workers to become members of trade unions and deal with their employers on their own strength. In order to encourage such a trend the government would have had to change at least two of its acts, the Industrial Disputes Act so as to incorporate trade unions as the negotiating body on labour's behalf and the Trade Unions Act to lay down specific measures through which a trade union can be recognised as being representative. However, this was not the government's purpose as it was afraid that trade unions under these circumstances could become too independent. They might then emerge not only as opponents of the employers but also of the government. The formation of the INTUC by the Congress as an opposition to the AITUC is clear indication of this fear. It also indicates the government's intentions of trying to incorporate the working class movement into the state. Moreover the legal framework for judging disputes when conciliation and arbitration failed were too expensive and long drawn for the workers. The employers were in a stronger position as they had greater staying power compared to the workers. The

government could have provided remedial measures by setting judicial courts for speedy decisions on industrial disputes.

The government justified its actions because of its policy of expanding industrialisation through the state sector. It explained that workers should not assume the same anti-capitalist position against the state sector which they assumed with the private sector. The new basis for development required industrial peace and co-operation of workers. The government realised that granting less protection to workers would lead to industrial strife as was witnessed during 1946-48 [Johri 1967: 103-04] and it was necessary to intervene in order to prevent this in future. The labour minister's speech at the eighth session of the Indian Labour Conference (1947) has this underlying implication. He noted: "...the worker has the right to expect assistance from the community and the state representing the community, and nowadays no abiding improvement will be possible unless the demands of the workers are backed by public opinion and the authority of the state..." [emphasis added, Johri 1967: 104]. This statement indicates that public opinion and state authority are linked with each other, hence the latter can decide what is good for the workers. Moreover the government's fear that the working class could oppose its policies can be seen from the following statement of the minister, "...our recent experiences in several cases have shown that no government can function if it allows the workers to be made a pawn of political parties interested not in bringing about an improvement in working conditions consistent with the general economic conditions in the country, but to secure a position of advantage for their own parties" [John 1967: 105]. The argument here is that if labour becomes anti-government it is a pawn of opposition parties but if it supports the state (as the INTUC did) it acts in accordance with public opinion.

The government's approach of promoting the state sector especially in the core industries was endorsed by most of the national trade union centres. The Second Five-Year Plan (1957) embarked on a massive programme of expanding the core sector industries through the public sector. All the major trade union centres, including the INTUC, AITUC, HMS and UTUC supported the objectives of the plan. The government needed this support as it would ensure industrial peace. The left unions, such as those supported by communists and socialists, drew a distinction between the private sector and the public sector where the latter marked the growth of the non-capitalist path to development. Ironically, the communists never tried to explain how a government which it had characterised as representative of capitalists and landlords could initiate a

path of non-capitalist development. However labour's support to the state's plan helped achieve higher growth rates during this period.

Apart from this, the projected pro-labour attitude of the government changed at the time of any serious challenge by the working class. In 1974 all the trade unions in the railways (except for the INTUC-backed ones) organised a nationwide strike. The strike was successful in spite of opposition from the INTUC as most railway workers participated and rail traffic came to a standstill. Instead of trying to understand the workers' demands, the government took a strong anti-worker stand and used the entire state machinery to break the strike. Ultimately the strike was called off as the government refused to negotiate. Similarly during the Emergency in 1975-77 the government enforced all measures to curb union activities and any form of militant struggles by the workers. At the same time it did not take effective steps to pressurise the employers into fulfilling their commitments to labour.

An examination of the industrial relations scene will show that whenever there has been any major confrontation between labour and management, government intervention has largely been in favour of the management. E. A. Ramaswamy's study of two industrial disputes, one in the textile industry and the other in the automobile industry, in Tamil Nadu [Ramaswamy 1986: 25-26] in the late 1970s gives a graphic account of state manipulation in favouring the employers. Another significant example is the strike by textile workers of Bombay in 1982-83. This strike was led by Datta Samant who was the most powerful union leader of Bombay then and it lasted for 18 months. For the first 15 months the entire textile industry in the city was at a standstill due to the strike and this was regarded as the largest and longest lasting strike in the country. The workers put forth demands which included increase in wages, regularisation of casual workers, etc, but their most important demand was that of derecognition of the INTUC-affiliated Rashtriya Mill Mazdur Sangh which was the representative union under the Bombay Industrial Relations Act. However in spite of display of unity by the workers and their determination to fight, the strike ended a failure. The government extended its full support to the employers and the representative union and did all it could to break the strike.³ In fact during this period the chief minister of Maharashtra (A. R. Antulay) was changed and the new person (Vasantdada Patil) was inducted because he was once a leader of textile workers. This was obviously done with the intention that the new chief minister would be competent in breaking the strike as he himself was a labour leader. We can see from these examples and many

others that the state has rarely ever taken a pro-worker stand in cases of major labour-management conflicts. In most cases the state has sided with the employers and used its authority to break the workers' movement.

PROBLEMS OF TRADE UNIONS

The state's intervention in regulating industrial relations has in general created more problems for the workers and for the trade union movement. In his study of labour politics, Rakhahari Chatterji (1980) observes that the elaborate legal structure along with adjudication by the labour department officials has placed the state between the worker and the employer with the objective of reducing industrial conflict. This has in effect undermined the role of internal unions. The complicated legal process makes it almost impossible for workers to tackle these internally and they have to depend on outside leaders to do so. Moreover, the ordinary workers are unable to deal with the state's elaborate bureaucracy on their own. They have to either develop or purchase the expertise to do so or find leaders with the right political contacts.

The state's policy has at times led to a rise in militancy among the workers. Since the legal process is complicated, long-drawn and expensive for the workers they often resort to violent outbursts or strikes to get quicker redressal. The rise of militant union leaders such as Datta Samant can be attributed to this. E A Ramaswamy's study of Bombay's working class shows the growing impatience of workers with the legal process. He quotes Samant who explains that "When the workers get something good from the lower courts, the employer goes to the Supreme Court and straightaway 10-15 years are lost. The worker naturally cannot afford to wait for so long to get things changed" (Ramaswamy 1987: 20).

The proliferation of trade unions on narrow party lines during the post-independence phase has also weakened the working class movement. Inter-union rivalries are at times stronger than conflicts between labour and management. In several cases when workers find that the existing trade union federations are unable to meet their expectations because they either tend to compromise with the management or they are split on party lines they turn to independent trade unions. Datta Samant's popularity as one such leader has been mentioned above. There are examples such as Shankar Guha Neogy, A K Roy and Ela Bhat.

Ela Bhat was a leader in the Majur Mahajan in Ahmedabad and she broke away to form the Self-Employed Women's Association (SEWA) in 1981 when she found that the union was not sensitive to the problems of

women workers in the unorganised sector. A K Roy organised the coal mine workers in the Dhanbad-Jharia belt in Bihar in the 1970s. The existing unions were affiliated to the larger federations and there was intense inter-union rivalry. Moreover, the union leaders were involved in exploiting the workers and were engaged in all sorts of nefarious activities. Roy's union attracted a large number of workers as they found it to be a committed workers' organisation. Shankar Guha Neogy organised the contract workers in the iron ore mines of Dalli Rajhara near Bhilai in Madhya Pradesh. The trade unions operating here were more concerned with the problems of workers in the organised sector, namely, the permanent and better paid workers of Bhilai Steel Plant. Neogy got overwhelming support from the contract labour and other workers employed in small and medium-sized industries in the region. Unfortunately he fell victim to his success as he was brutally murdered in 1990. It is suspected that some of the local industrialists were involved in planning his murder. There are several other cases of independent unions in the country. In most cases they have come up as alternatives to the existing trade union federations. The concerned workers have tried to seek alternatives for improving their bargaining conditions with their employers. These unions therefore expose the weakness of the traditional trade union federations. The main feature of these unions is that they are usually centred around a particular leader. This may create problems

later as the policies of the union are determined by the leader.

There are other types of independent unions which are different from the leader-based ones discussed above. In the modern industries which use higher levels of technology and engage skilled and better educated workers we find a tendency of single unions. This is fairly common in the large enterprises in cities like Bombay, Bangalore, Pune and Hyderabad. Many of these unions are not affiliated to the trade unions federations and even if they are their effective leadership is elected from within the workers. The trend towards a single internal union arises precisely because workers in these enterprises want to have a single bargaining agency.

Almost all major unions in India have admitted at some time that multi-unionism is the major drawback of the trade union movement. In several large establishments we can find a number of trade unions operating among the workers. Some of these have very small membership at the unit level but they continue to exist. While the division of trade unions on party lines is to an extent responsible for this chaotic situation, the legal framework, or the lack of it, provides the impetus for multi-unionism. We have discussed earlier how the state has elaborate laws which have been framed ostensibly to protect workers. However the most significant aspect of the legal system regulating industrial relations is that there is no law providing for compulsory recognition of trade unions in

enterprises. Recognition of unions as bargaining agents is left to the discretion of the management. We have discussed earlier about the failure to carry through the Acts of 1950 which would make union recognition compulsory. Thus in the absence of any mechanism for compulsory recognition it is possible for unions with minuscule membership to vie for recognition. Managements find it easy to create division among the workers by recognising more than one union.

This problem is rooted in the Trade Union Act of 1926 which has remained unchanged ever since. The Act provides for registration of unions but it allows any union with 10 or more members to be registered as a trade union. Verification of union membership is left to the Registrar of Trade Unions and is rarely done. Instead unions are asked to voluntarily submit their membership figures and it is often found that the total membership of all unions exceeds the number of workers employed. Moreover, the Industrial Disputes Act of 1947 which provides the framework of the industrial relations system allows state appointed labour officers to mediate in disputes between labour and management. Any registered union, irrespective of the size of its membership can bring up a dispute before the conciliating officer and seek redressal. This makes it possible for several unions to exist without being recognised by the management. Even when regional legislation exists, such as Maharashtra Recognition of Trade Unions Act, the method for recognition as representative union is unsatisfactory as membership verification and not election through secret ballot is the means.

Compulsory recognition of trade unions as bargaining agencies could bring some order in the present situation. The national trade union federations all agree that the majority union in an enterprise should be recognised as the principal bargaining agent. However there are sharp differences on how to establish this majority. The national federations such as the AITUC, CITU, HMS, UTUC and TUCC are strong advocates of the use of the secret ballot to decide the issue. The BMS also advocates voting but wants to restrict franchise to only those workers who are unionised. The INTUC on the other hand is equally strong in opposing this measure. It has all along insisted that the majority should be established through verification of membership. It argues that the ballot will be vitiated by money power, muscle power, caste and communal factors. The advocates of the ballot hold that when the government is chosen by secret ballot there is no reason why the negotiating agent cannot be chosen in a similar manner. They have strong reservations on assessment of a union's strength on the basis of membership

verification as this is done by the government officials. The government in power can influence the verifying officers. The check-off system, where deduction of union membership fees is made by the management from the worker's pay is also not a reliable method as managements can assume a decisive position.⁴ These opposing positions on trade union recognition have created a deadlock in arriving at any decision on the subject. Therefore, as things stand, unless the state decides to amend the existing industrial relations laws the working class will be plagued by the problem of fragmentation through multi-unionism.

CONCLUDING OBSERVATIONS

The above discussion has attempted to analyse the role of the state in the working class movement. The state tries to justify its involvement or intervention in industrial relations on the grounds that the workers are the weaker section and they need its protection for defending themselves against the employers. Moreover, the state's policies are also guided by the desire to maintain industrial peace. However, we find that the continued involvement of the state has not achieved the desired objectives. The long winded and expensive legal processes have frustrated the workers who have frequently taken to militant struggles. The state has often sided with the employers in disputes with workers. The worst consequence of state intervention through its labour department has been the undermining of the trade union movement, in other words, the workers' abilities to organise themselves and articulate their own problems.

The working class and the trade union movement have however not accepted state intervention passively. Though the working class movement has been fragmented into a number of trade unions which is partly due to the influence of political parties and also due to the laws which allow this system to flourish, the workers have formed trade unions to meet the various types of challenges. It is found that when the existing trade unions are unable to meet their aspirations new types of unions are formed. Therefore, the trade union movement as a whole has been flexible enough to adapt itself to changing situations. This is strengthened by the fact that the average worker realises that trade unions can protect his interests more effectively than the state.

The changes taking place in the economy through the process of liberalisation pose the greatest challenge to the labour movement. There are job losses in the organised sector and an expansion of the unprotected/unorganised sector. A fragmented trade union movement can hardly provide any checks to this process. The need for trade union unity

is most important at this crucial juncture in order to counterpose the threats by the employers and the state. Hence trade unions need to first of all put their house in order and protect the interests of labour. Only then can they influence the mechanisms of the state in fragmenting unions.

Independent Trade Unionism in West Bengal

Sarath Davala

The growth of independent trade unions is a reflection of the inability of the political trade unions to meet workers' needs. But are independent unions capable of emerging as an alternative movement? An examination of the growth of independent trade unionism in West Bengal where centralised party unionism continues to be the dominant form.

WEST Bengal is the cauldron of party unionism. Multiplicity of unions is practically a norm in this state. CITU, the trade union wing of the ruling party CPI(M), is not surprisingly the dominant union, with INTUC coming next. All other national centres such as HMS, AITUC, TUCC, UTUC, UTUC(LS), NFITU, AICCTU, etc. have their symbolic presence virtually everywhere irrespective of their membership strength, though each has its own pockets of influence in specific industries. HMS, for instance, has a substantial following in ports and railways, and together with AITUC in the coal industry, while other unions have limited following in certain specific regions and industries.

West Bengal has both industrywide bargaining as well as unit level bargaining. Since 1969, there has been industrywide bargaining in the four major industries: coal, engineering, tea and jute. Since the state has no clear-cut method of selecting the bargaining agent, all the party trade unions (PTUs) participate in negotiations and are signatories to the three year agreements. These agreements exclude the central public sector units and units employing less than 50 workers. Even though all the PTUs participate in negotiations, there are actually two groups which submit charters of demands to the employer organisations. These two groups are led by CITU and INTUC respectively. The rest join either of these groups. While the INTUC group consists of HMS, AITUC, NFITU and UTUC, the CITU group comprises TUCC, UTUC (LS) and AICCTU.

In case of central public enterprises, each company has its own companywide bargaining. Coal India, for instance, has national level negotiations and signs company level agreements. In industries other than the four mentioned above, such as chemicals, pharmaceuticals, fertilisers, paper, leather, etc, there exists unit-level bargaining. Even in the case of the four industries mentioned above, there exists unit level bargaining in case of large units which have the capacity to pay more than what the industry agreement prescribes. Companies like Philips, Siemens, Bata, Lever, Indal, etc, sign unit level settlements with their respective unions.

Whatever the level of bargaining, the state has no accepted and uniform practice of

recognising a bargaining agent. As a result, very often, managements adopt the easiest path of recognising, either formally or informally, most of the unions, that is, all those that have party backing and 'nuisance value'. This situation has given rise to two consequences. One, this motivates PTUs to start a union either at the unit level or at the industry level, even if they do not have any following. Second, in the absence of any clear democratic procedure to establish the majority union or unions for the purpose of recognition, trade unions adopt various methods to demonstrate their strength such as gate-meetings, demonstrations, departmental strikes, gheraos, and so on. There are only few cases, particularly among the multinational companies, where on the insistence of managements the bargaining agent is elected through ballot.

It is interesting to note that CITU which has been fighting in favour of secret ballots as the method of recognising trade unions at the national level, is hardly enthusiastic about implementing it in its own home state. In the late 1970s, when CITU was confident of its popularity and following among workers in West Bengal, the ruling party had passed a bill in the state assembly providing for a clear procedure for recognition. This bill subsequently received the president's assent in 1994 and has been referred by the state government to a study committee for formulating rules and regulations. According to this law, only those unions which have an individual membership of at least 10 per cent of the total workforce were eligible to participate in the joint negotiating council. And, for a union or a combination of unions to sign settlements with managements, it or they should have a minimum of 51 per cent of the total workforce as their members. The bill stipulated that membership of a union should be established through a secret ballot. Given the present situation of CITU's support among the rank and file, which we shall discuss later, neither CITU nor the CPI(M) is keen on implementing this law. According to non-CITU unions in Calcutta, reference to a study committee is a way of delaying the implementation. In any case, none of the opposition unions is keen on facing a ballot either. Therefore, keeping the new law under wraps seems to suit all the party unions.

ALTERNATIVE FORMS

While it is true that the dominant form of trade unionism in West Bengal is centralised party unionism, there are also pockets of 'independent' trade unionism in this region. We can broadly categorise such unions into two groups. One, those unions which have remained independent and unaffiliated to any PTU more or less since their inception. These unions exist in large, high profile companies such as Lever, Bata, Indal, etc. These companies typically employ educated workers who are paid relatively higher wages than those in the traditional industries. Also, these units, because of their higher wages, fall outside the industrywide agreement and sign separate unit-level agreements with their respective managements. In the second category fall those unions or 'quasi-union formations' which have mushroomed during the last four to five years, as a reaction to the ineffectiveness of the PTUs in taking up their problems. While the bulk of such formations exist in the jute industry, there are some in the engineering industry as well. Let us examine some cases of both the above types of unionism in and around Calcutta.

Bata: Bata has a single union, which at one time was affiliated to AITUC. This affiliation, today, is only on paper and has no practical relevance. The union conducts elections every year. While at the departmental level all the positions are contested by the employees themselves, in the executive committee, four positions are thrown open for external leaders. Leaders from almost all the party unions, particularly CITU and INTUC contest these elections. Normally each PTU puts up its own panel of four candidates. In 1994 INTUC held the leadership while in 1995 CITU came to power.

Hindustan Lever: Hindustan Lever, a well known soap and detergent manufacturer, has one of its largest factories located in the Garden Reach area, a major industrial suburb in Calcutta. It employs about 1,800 workers. There is only one union in the factory which at one time was affiliated to INTUC, but later, by default, disaffiliated itself, and ever since remained independent. Though a single union, there have been three major factions within the union: two belonged to INTUC and CITU, while the third was an independent group led by an outside leader who was

formerly a CPI(M) party member and a CITU leader but later resigned from both, protesting against their policies and practices.

According to the union constitution the office-bearers have to be elected once in two years through secret ballot. The CITU group which came to power in the early 1980s kept postponing elections under one pretext or the other. In 1986, the CITU leadership signed a settlement with management which was resented by the workers. In a secret ballot election which it was forced to conduct in 1987, the panel put up by the independent group came to power. In the same year, management decided to close down one of the departments manufacturing Rin detergent, and retrenched 300 contract workers. The union opposed the closing down of the department, and workers went on a flash strike. Management immediately suspended all the union executive committee members. Workers continued 'go slow' for six months, and management retaliated by derecognising the union. In its place, management formed a yukhta committee comprising of the leaders of the INTUC and CITU groups, and through this committee announced an *ex gratia* payment of Rs 500 for only those workers who resumed work. Workers did not respond to this and continued the 'go slow'. In the meantime, management retrenched another 100 workers in the Rin department. This was followed by a massive offensive by the management on workers in their houses located in the nearby slum. Police raided houses of workers, and about 300 to 400 policemen were posted inside the factory in order to create panic among workers. Musclemen, allegedly deployed by the leadership of the rival groups, unleashed terror in residential areas of the workers. Management at the same time also managed to keep away journalists, and there was a complete blackout in the media.

The union moved the high court questioning the *locus standi* of the yukhta committee to negotiate with management on behalf of workers. The high court ordered a secret ballot election. The management along with the yukhta committee appealed to the Supreme Court which, however, upheld the high court judgment and ruled that the high court must deploy an officer to conduct the elections. The management appealed to the court saying that the election could not be held in the factory premises as there was a risk of violence inside the factory. The court ordered that the election be held in the premises of Calcutta Municipal Corporation. The chairman of the corporation refused permission saying that the CMC was preparing for the Tricentenary celebrations and an election in its premises would vitiate the atmosphere. The high court then ordered that the election should be held in the nearest police station. The police authorities refused

to hold election in their premises as the land did not belong to them. When the union again appealed to the court, the judges, in utter disgust, ordered that the election be held in the high court premises itself.

At this stage, the management pleaded that it would not be appropriate to hold a union election in the high court premises, and finally agreed to hold election in its factory premises. By now, altogether three years had passed from the time the court first ordered the ballot. Despite threats from the established unions not to participate in the elections, workers turned up in large numbers and voted. The independent group won all the 21 positions with a thumping majority.

After the election, the first issue the union took up was the issue of the retrenched contract workers. The management agreed to take back 100 workers in a phased manner. In the next election conducted in 1993, the independent group again came to power despite the fact that this time round the INTUC and CITU groups put up a joint panel.

Indian Aluminium (INDAL): The Indal factory is located in Belur which is an important industrial centre in Howrah district. It employs 1,300 workers. The first union was registered in 1944. A year later the office staff moved out and registered another union. In 1949, however, both the unions merged into one union called Indian Aluminium Belur Works Employees' Union which has all along remained unaffiliated to any PTU. In 1965, a group of workers moved out of this union and formed another union and affiliated it to INTUC. This union has only 150 members while the independent union which is also the recognised union has 1,150 members.

The independent union conducts elections every year to elect the 44-member executive committee which, in turn, nominates the office-bearers. Very often the EC members are decided beforehand through consensus, and it is only occasionally that a ballot is conducted. The president of the union remarked: "I have been the president of this union for the past 12 years, and on all occasions I was elected unopposed."

Asked why they chose to remain independent, a senior office-bearer of the union said: "Our members realise that we can manage our affairs efficiently without any affiliation. So they see no need for external affiliation. For instance, recently there was a proposal by our management to merge our company with Mahindra and Mahindra. We opposed the proposal tooth and nail, as there was no guarantee that our service conditions would remain the same. We acted swiftly and moved the high court and obtained an order in our favour. We have never made our members feel that without affiliation we are weak. On the other hand, the PTUs have a tendency to centralise all issues, keeping

workers in the dark. We know our specific situation much better, which the outside leaders do not."

Why do workers seek affiliation in the first place? The president answered: "They do so because they lack confidence in themselves. All our members are educated and are confident that they can manage their affairs on their own."

Indal is one of those few companies in West Bengal which pays much above the industrywide agreement. Bargaining takes place once in three years at the unit level, and management signs agreement with the recognised union. However, at the time of negotiations even INTUC presents its charter of demands, and if the management wants to concede any of these demands, they are incorporated into the main agreement.

Indo-Japan Steel (IJS): IJS is a mini-steel company established in 1966. It manufactures manganese, stainless and mild steel. It has an annual sales turnover of Rs 12 crore and employs about 900 workers. Its only factory is located in Belur, some 10 km from Calcutta. It has only one union which is not affiliated to any of the PTUs. The union was affiliated to INTUC only briefly for a year in 1976. During this year there had been a lock-out. The president of the union recollected: "When the management imposed the lock-out, we ran from pillar to post for help. We met various ministers including the chief minister. Nobody helped us. We received very little support and help from INTUC leaders. That is when we realised that we should not depend on any external leadership. We did not renew our affiliation the next year, and it automatically got cancelled."

In the late 1980s the company ran into difficulties, and in 1990 it was declared sick and referred to BIFR. Three years later, BIFR ordered the liquidation of the company. The management took the matter to the Appellate Authority of Industrial Finance and Reconstruction where the revival package submitted by the management is pending now. In the meantime, in May 1995, management 'suspended operations' and closed down the unit. Fearing that the factory would be permanently closed, workers forcefully took possession of the factory, and have been ever since guarding it. They are confident that they can run the factory on their own and make it profitable again.

In responding to a crisis situation, the union leadership feels that being an independent union is advantageous in several ways. The president of the union said: "We are free to approach any body for support without hesitation. We are free to decide our destiny without any political compulsions. All our decisions are taken in our general body meeting."

The management was, however, not very comfortable with this kind of union leadership

which was very close to its membership. In 1993, with the help of the local BJP unit, it had tried to install another union to counter the existing one. But the effort failed miserably with workers chasing the intruders out of the factory.

Talking about the political trade unions a worker said: "The political trade union leaders make the union work appear very complicated. That you should know English, various legislations, etc. When Kanoria workers formed an independent union political leaders mocked at them saying, 'Now you have formed a union of your own. Can you go to Delhi and talk in front of the big people? Let's see how far you will go.' But, I tell you, an independent union is the real union. We get to know everything. In fact, during our negotiations every evening we have a meeting to chalk out our strategy. As far as information is concerned, we are never in the dark. On the other hand, when political unions negotiate, workers know nothing about what is going on. In many cases after the settlement is signed, it is through the management and not through their union leaders that they come to know of what has been agreed upon on their behalf" (translated from Bengali).

In 1994, the IJS employees' union undertook an activity which was rather unusual for a union. The union decided to set up a community hospital for its employees and also for the general public. It took permission from the management and occupied an abandoned building adjacent to their factory. It contacted a group of junior doctors to work for the hospital during their free time. All the furniture required for the hospital called Shramjibi Swasthya Prakaalpa (SSP) was made by workers themselves from the scrap that was available in their factory. A year later now, the union is proud of the number of activities taken up by SSP. During this period SSP has conducted about 250 surgical operations. Annually it conducts 'operation campaigns' in the local villages to conduct hernia and hydrosal operations. SSP also has conducted some very complicated surgeries in the past few months. The case of a truck driver is particularly noteworthy. This patient had met with an accident in which his leg was badly damaged. He was kept in the local hospital for 15 days after which he was told that his leg had to be amputated. IJS workers brought him to SSP and called a surgeon who was on their panel. The surgeon said that there was no need for amputation provided surgery was done within 36 hours. The problem however was that for the surgery a special type of imported surgical table was required which cost about Rs 20,000. There was only one such table available in a private clinic in Calcutta. Getting the surgery done there was also quite expensive which the patient could

not afford. Immediately, the union sent a team of workers to this private clinic to see the table. The team came back with rough specifications of the table, and within eight hours made one in their factory. It was installed in an hour's time and the surgery which took nearly ten hours was completed successfully.

The president of the union said: "The most important reason why we started SSP was to relate ourselves with the local community. It is very important to have the support of the local community. What usually happens is that when we are doing well we hardly care for the community. But when a crisis strikes, we immediately rush to people for their support. When you don't care for them, why should they support you when you get into problems. They see you just as self-serving people. Through SSP we maintain a relationship with the community on a regular basis. It has brought us a lot of goodwill in the community. The second reason is to make our own workers think of their union as something more than a mere negotiator for more money. We want them to have a better identification with the union and involve themselves in its activities. They should feel proud of belonging to their union, and that it has an ideology."

JUTE INDUSTRY

Traditionally, as discussed earlier, the jute industry has been the bastion of the party unions, and the agreements were signed at the industry level. The jute industry has been going through a deep crisis during the last decade, which is evident in the number of lock-outs that took place in the industry. On the trade union front also there have been changes during the last 5-6 years. The most important change has been that of workers rejecting the party trade unions and forming their own independent unions. The most

widely publicised example was that of Kanoria jute mill. In addition to this there have been several units such as Victoria, Hanuman, Baranagar, etc, where this change has taken place. Let us examine some of these cases.

Victoria Jute Mill: The recent events of Victoria Jute Mill are perhaps the most dramatic expression of the rejection of party trade unions by ordinary workers. The mill is one of the four mills owned by Titagarh Company which is owned by a Britisher, R J Brealey. The day-to-day management of the company is done by a raw jute trader called R K Jain. In October 1993 which was festival season in Calcutta, the workers demanded that their weekly wages and the annual bonus be paid to them before the 22nd of the month. It is a common practice among companies in Calcutta to pay the annual bonus and arrears, if any, before the festival season begins. In a tripartite meeting with the labour commissioner, it was decided that the money should be paid to the workers on October 17. But, on that day the money was not paid. The management assured the workers that their dues would be paid in two days' time, and their pay slips were also issued. This was also not done and there was no trace of the promiser. On October 20 the workers got agitated, and what was interesting was that the wrath of the workers was not so much against the employer but was on the trade unions. They attacked the houses of the union leaders of all shades - INTUC, HMS, CITU and AITUC. They even assaulted some of them. Almost all the union leaders fled the area, some lodged FIR with the local police, and seven workers were arrested.

The next morning, about 1,000 workers assembled before the police station and demanded the release of their colleagues. When the police refused to release them, the workers again attacked the union offices

belonging to the INTUC, CITU and AITUC, situated near the mill gate. A scuffle broke out among workers and the three armed policemen who were posted near the mill gate. The police opened fire and workers also retaliated. Several workers were injured and one policeman was seriously injured and later died in the hospital. The police went on a rampage in the workers' colonies and arrested 30 workers. The employer took advantage of this situation and declared suspension of work.

In Victoria, such spontaneous outburst against the party unions however did not take any concrete shape as in the case of Kanoria which we shall turn to now.

Kanoria Jute Mill: Kanoria jute mill is the most publicised case of what is generally referred to as 'self activation' of workers in West Bengal. Located in Howrah district, some 20 km from Calcutta, the mill employs about 4,000 workers. For the last five years the mill experienced sporadic lock-outs and closures, as a result of which management owed a substantial amount to workers in the form of PF, gratuity and other dues. Vexed with complete indifference and callous attitude of the recognised trade unions to their demands, sometime in the early 1993, workers, *en masse*, deserted the established trade unions and formed an independent union called Shramik Sangram Union (SSU). In November, led by the SSU, workers went on a sit-in strike demanding their accumulated dues. Within two days, the management retaliated by 'suspending operations' which though technically different from a lock-out, actually means much the same. About a month later, in an unprecedented move, workers forcibly entered and took possession of the factory, and resumed production. The SSU made an appeal to other industrial workers and the general public for support. There was spontaneous support, including financial, from all corners, with which the union managed to pay the wages to workers. The SSU also ran a community kitchen to feed the workers. In the meantime, the owner of the factory moved the court and obtained orders preventing workers from selling the product in the market. The court, however, allowed workers to stay within the factory premises.

The reaction of the CPI(M) and the CITU to these events was interesting. The party and the union leaders who otherwise vouch for class revolution in all their public statements, criticised what Kanoria workers did. The official position of the party and the union was that they were against workers storming in, taking over and starting production. They said that the SSU was misleading workers. Further they also started a campaign to malign the SSU saying that the union was being financed by a rival industrialist. Such false allegations notwithstanding, public support

to Kanoria workers was unprecedented, to the point that the CITU could no longer stay away from what the media dubbed as 'a historic struggle'. A tripartite meeting of management, labour commissioner and the recognised unions was convened to discuss various grievances of the workers. The SSU was however kept out of this meeting saying that it was not a recognised union. The SSU organised a gate meeting and asked workers whether they would accept any agreement signed by the recognised unions without involving the SSU. Workers unanimously said they wouldn't. In the meantime, following overwhelming mass support to the SSU, chief minister Jyoti Basu agreed, much to the displeasure of the CITU, to meet with the SSU. He assured the union all co-operation in arranging for the sale of finished goods lying in the factory godown. Subsequent to this, the SSU also submitted a proposal to the BIFR to run the mill as a workers' co-operative. The matter, after nearly a year, is still pending with BIFR.

Shree Hanuman Jute Mill: The Hanuman jute mill, a family-owned company, employs around 4,000 workers. It is yet another example of ordinary workers fighting against not only the employer and the state machinery but also the trade union establishment. Owned by the Jalan family prior to 1991, the company went through serious problems due to family quarrels, lack of funds, lock-outs and strikes. The company was referred to the BIFR which in 1989 ordered liquidation. It was around this time that workers lost faith in the three recognised unions that represented them, and formed a separate independent union called Majdoor Samithi. When the BIFR ordered liquidation Majdoor Samithi petitioned the BIFR requesting it to give them some more time to come up with a revival scheme. The mill was closed in 1990, and opened only when the Jalans leased it out to another industrialist called Bajoria.

In 1991, within a few months after Bajoria took over, there was again an industrywide strike, and the company was closed down once again. Even after the strike was withdrawn, the mill remained closed because during the period of strike Bajoria had absconded. When workers went to Jalan and gheraoed him, he told them that he no longer owned the mill, and it was Bajoria who owned it. The mill remained closed for months, and Majdoor Samithi leaders ran from pillar to post for help. They approached all the party trade unions, but nobody came to their rescue. The workers gave a deadline of October 1, 1992 to the owner for reopening the mill failing which they threatened to break open the factory gates and take possession of the plant. The superintendent of police intervened and assured the workers that he would persuade the owner to reopen the mill. That was the moment when the

recognised party trade unions jumped into the fray and met the owner for negotiations. In no time they arrived at a settlement with the owner, agreeing on behalf of workers that they would take a wage-cut for four years if the mill reopened. The Majdoor Samithi went to court and brought a stay against the agreement signed by the recognised unions. The Samithi also produced evidence before workers that the party unions had taken bribes from the owner to sign the settlement.

The mill was, however, opened in mid-1993. The Samithi claimed that it had the majority of workers with it, and that the management should negotiate only with it and not the party unions. It also demanded secret ballot elections to settle the question of union recognition. The management paid no attention to this demand. In December, the term of the provident fund trustees and members of the works committee had expired. The Samithi immediately demanded elections which the management could not refuse. In the ensuing elections the Samithi won three out of five positions in the PF trust and seven out of nine positions in the works committee, with a majority of 85 per cent of votes.

As soon as the Samithi candidates took over these positions they started demanding regular payment of PF contribution. The Samithi leaders proudly claimed that in comparison to the management contribution of Rs 40 lakh in the year of 1993, within 18 months from January 1994 to June 1995, they have forced the management to deposit Rs 5 crore. Despite the modest success the Samithi had in establishing its credentials and support among workers, its leadership is still facing constant threats and pressures from the party unions to give up the Samithi and join them. One of the secretaries of the Samithi said, "Surely our life is in danger. Confrontation with the CITU is not an ordinary thing here in our region. Almost every day we receive some kind of threats from the CITU people. They have made our lives difficult. We have been particularly targeted because we are surrounded by closed mills where the CITU is the recognised union. For the CITU, we are a bad example because we have thrown the party trade unions out and through our own efforts managed to keep the mill going which they have been unable to do".

OTHER ALTERNATIVES

The events in the jute mills discussed above are a clear sign of workers protesting against the party trade unions. There are a large number of jute mills where workers have formed 'save committees' comprising all the workers irrespective of their union membership. Such committees have mushroomed during the last four or five years even in the engineering units whose existence is threatened.

While these events are the rumblings of worker protest at the micro-level, there is also a search for alternatives at a macro-level. There are at least three independent and amorphous groups-not unions - which are working towards an alternative to the party trade union bureaucracy. These groups are: Nagarik Mancha (NAM), Marxwadi Mancha (MAM) and Shramik Sangram Committee (SSC). Of the three groups, the first group is perhaps the most developed and well organised in terms of articulating workers' interests. It is useful for our discussion to examine this organisation in some detail.

Nagarik Mancha (NAM): This is an independent voluntary group established in 1989. Initially, the group devoted itself to the cause of industrial sickness: to study the problem and help workers in protecting their jobs. But subsequently, it enlarged its scope to include labour concerns such as various social security measures and their administration, occupational health and safety, and environmental issues. The group consists of individual volunteers drawn from various walks of life having concern for the working class. The volunteers spend their private time for NAM activities. Within a short span of its existence, NAM has become well known in the labour circles in and around Calcutta, primarily through its involvement in various struggles of workers against industrial sickness, and secondly, through its number of publications. NAM brings out regular monthly bulletins in Bengali and English, pamphlets on a wide-range of subjects concerning labour, and occasionally books too, both in English and Bengali.

The NAM volunteers do not see their organisation as an alternative trade union organisation, but rather as a resource group to assist labour in their struggles. A volunteer commented: "We don't intend to be one more central trade union organisation. It doesn't serve any purpose. You will merely have one more organisation. And if we become one, what is it that we would do? Like all others we may get more wages for workers. We have many examples of independent unionism, for example, in the Mumbai region. But, in our opinion that is not a sustainable form of trade unionism. One of the alternatives that we can think of at this juncture is worker co-operatives. That is the reason NAM originally started with the objective of working for the cause of sick enterprises".

The NAM does not take an antagonistic stance towards party trade unions. Wherever required it also works with them on issues common to labour. A senior volunteer and also one of the founders of NAM said: "We don't see the situation in black and white. Just as party trade unions have their limitations and weaknesses, independent unions also have their limitations. NAM is

with workers whether through party unions or through majdoor committees which are formed by workers themselves. The latter we see as a positive development because it is a protest against the established trade union bureaucracy which has, over the years, become an end in itself. However, the problem with independent unions is that they do not have a long-term perspective. They are concerned with their own immediate problems. For instance, jute workers (i.e., mazdoor samithis) do not think they have anything to do with the problems of the jute cultivators. You see, you cannot solve problems in isolation. The industry itself is going through a crisis. The problems must be tackled at a broader level. Bachao committees may save some units from sinking, but if the industry itself is sinking, what is the point in trying to save units. So, to the extent they take a narrow view of the problems they cannot become an alternative to the central organisations. A true alternative should have several other elements. Therefore, taking all these issues into account, we see the independent unionism as only a transitional phase, at least in West Bengal".

Bachao committees, a type of union formation, have mushroomed in a number of units which are under the threat of closure. These are ad hoc committees formed by workers coming together to pool in their efforts to save their companies from closures. The NAM has been quite instrumental in introducing this idea in 1990, which has now become a trend in the state. A NAM volunteer explained: "Bachao committees are not registered bodies. They are ad hoc committees formed by workers themselves with a specific purpose, i.e., to save their jobs. Typically, what happens is that, in a multi-union situation when workers realise that their jobs are at stake, and find that the party unions cannot fight for them, they come together and form a bachao committee to co-ordinate their activities in making representations either to BIFR or to the government, or to undertake a campaign to save their unit.

"Initially, when we suggested this idea to the workers, the question arose whether these committees should be registered, so that they have a legal status. We felt that there was no need to register a new body or a union. That would only put the party unions on the defensive, and you cannot accomplish anything by doing that. What was required at this moment was not to antagonise these unions but to seek their co-operation and unite workers for a specific purpose. In any case, the very formation of a bachao committee is a reflection of the failure of party unions, at least in their present form. But bachao committees initially ran into a serious problem, i.e., nobody, particularly the government, was willing to recognise them

as the representatives of workers. It took us nearly two years of fight to make government and BIFR to recognise bachao committees as legitimate representatives of workers. We have always told workers that forming a new union and registration are the least important matters. What is really important is to be united and struggle for a cause."

During the last two years, the NAM was also a part of the initiative by a group of independent unions in and around Calcutta to form an umbrella organisation. This organisation with a membership of some 50 unions is called the Mazdoor Adhikara Raksha Committee (MARC - Committee for Protection of Labour Rights). This is still a fledgling organisation which has had only a few meetings of its members so far.

The other two voluntary groups mentioned above, MAM and SSC, function as

independent groups without any formal structure. MAM has a number of independent unions under its influence and leadership in the Panihati area, while the SSC has been spearheading an independent movement in the Garden Reach area. Unlike the NAM which is known in a broader spectrum of industries, both the MAM and the SSC are well known in their respective regions. What is common to these three groups is that all of them are in search of an alternative trade union movement and trade union politics. Their reluctance to give themselves a formal structure is an indication of this search.

In West Bengal, within trade union circles, there have been two major reactions to the above developments. The voluntary groups mentioned above view these developments as signs of an alternative trade union movement emerging in the state. The developments, particularly, in the jute industry are viewed as 'self activation' of workers. The second reaction, that of the party unions, has been that these are merely some isolated instances with no wider significance.

While it is premature to describe these developments as signs of an alternative movement, the dismissive attitude of the party trade unions is also not justified. These developments, however, are not without deeper significance. What they clearly bring to light is the inadequacies and the limitations of the party trade unions. Their failure to respond to the present crisis.

For the purpose of our analysis, let us distinguish between the two types of independent unionism described above. The first type exists in large, high profile, modern factories such as Bata, Lever, Indal, etc., employing educated, skilled and relatively well-paid blue-collar and white-collar workers. In all the four cases described under this category, the tension between the party trade unions and the independent groups is evident. In the Indal factory this confrontation is minimal with INTUC more or less accepting minority status. Bata workers have evolved a middle path of retaining their autonomy and at the same time maintaining links with the outside party union leadership by electing them from time to time.

It is in the case of Lever that we see the confrontation in its most intense form. The case brings out in a dramatic fashion certain characteristic features of the party trade unions. Over the years, the PTUs have become highly centralised and top-down organisations with little or no direct communication with their membership. Internal democracy has been totally absent in their way of functioning. Secondly, they have reduced trade unionism to mere wage bargaining, thus lacking the ability to respond to any other crisis affecting their membership. Thirdly, to all the PTUs, their own survival

has become an end in itself. As exemplified in the Lever case, the PTUs do not hesitate even to collude with managements in order to survive, even at the cost of workers' interests. This survival instinct is common to all PTUs, in the sense, when confronted with an independent group even rival PTUs come together on a common platform to fight it.

The case of Indo-Japan Steel union brings out two important issues. First, that some managements prefer and are more comfortable with party trade unions rather than with a democratic and internal union. The reasons are obvious. In the case of PTUs, they have to deal with just one of two outside leaders whom they can manoeuvre, whereas in the case of an internal union which is democratic they have to deal with leadership which has direct communication with the workforce. The second issue relates to the very definition of trade unionism. IJS union has demonstrated, through its activities, that a trade union can be much more than a mere wage bargainer.

The second type of independent unionism is found in the jute industry. The formation of bachao committees and majdoor samithis in jute mills is a clear reflection of the redundancy of party unions which have been responsible for deep fragmentation of labour in every unit. Such fragmentation suited these unions as long as their job was merely to negotiate wages and sign settlements or sit on various committees formed by the government, or for that matter do a number of things on behalf of labour. However, when the question of fighting against closure or job losses came, which required all the workers to fight as a united force, their limitations and contradictions immediately surfaced. Bachao committees and majdoor samithis are spontaneous

bodies reflecting the immediate needs of workers. The PTUs feel threatened by these developments because they also reflect their weaknesses and failures.

In the ultimate analysis, what does the growth of independent unions mean? As stated earlier, the redundancy of the PTUs is obvious. But, are independent unions capable of emerging as an alternative movement? Elsewhere in the country, particularly in Mumbai region, the experience with independent trade unions has been that they tend to be isolationist. They are relatively more democratic than the PTUs, but their concerns are limited to their own micro situations. Even after nearly four decades of their existence, the independent unions in Mumbai have not been able to come together to build a wider movement, i.e., an alternative to the party unionism.

Independent unionism in West Bengal can at best be seen as a healthy and legitimate protest against the redundant party trade unionism. What needs to be done further is to evolve creative trade union ideology and politics. Independent unions can provide alternative only at the unit level, but not in a wider context. What we need today is an alternative movement in a wider sense. The hope lies in the fact that the voluntary groups working with labour in West Bengal are thinking along these lines.

Operationalisation of Flexible Specialisation

Agra's Footwear Industry

Peter Knorringa

Even though no industrial cluster in the world can live up to the flexible specialisation model, it does generate ideas useful for exploring possible roads ahead for low-tech craft-based clusters in India. In this paper the authors argue that a comparative advantage in manufacturing quality-competitive hand-made shoes can only be achieved if workers are not treated only as a cost but also as an asset. Still, at present most workers in Agra manufacture low quality products under sweat-shop rule. A shift to more quality-competitive production with better employment conditions seems feasible because of, firstly, the present underutilisation of artisanal skills, and, secondly, booming market niches for fashionable artisanal designer shoes. However, such a shift is impeded by caste-based antagonism, omnipresent instability and the use of outdated technologies.

I Introduction

SEVERAL recent studies have raised the question whether the concept of flexible specialisation is useful in analysing industrial developments in the third world [Pedersen et al 1994; Rasmussen et al 1992; UNCTAD 1994; for a focus on India see Galhardi 1995; Holmstrom 1993]. Unfortunately the discussion appears to have got stuck at a too broad-brush level of analysis, where authors can easily use the concept to construct 'new' cancanures to prove 'old' ideological stands. Flexible specialisation has turned into a catch-phrase that means too many different things to different people, which provides an excellent reason to discard the concept completely.

However, to avoid throwing the baby out with the bath water, we propose to 'unpack' the concept.¹ In this paper we attempt to operationalise the concept of flexible specialisation in the context of small-scale manufacturing in Agra's footwear industry. We argue that, while approximately 80 per cent of footwear labour in Agra appears to be trapped in a vicious circle of sweat-shop employment, the significance of a small but viable segment of the cluster can be best analysed with an unpacked flexible specialisation concept. The crucial question then becomes: can such an analysis contribute to a better understanding of options to increase the share of more attractive employment in more flexible and more specialised firms? We think it can, to some extent.

Moreover, there is urgency to this question as craft-based clusters are more and more driven to market niches and just continuing to rely on sweat-shop practices will lead to shrinking employment at deteriorating conditions. This provides a very strong reason to look seriously at other options. So, its importance lies in the inevitability to confront the issue of employment options facing the artisanally skilled in India [Mathew and Joseph 1994]. As a shift towards more quality-

competitive production perhaps offers a way out for a small but significant group of artisans in particular industries it is worthwhile to further investigate this question.

In Section II we try to thrash out some useful ideas from the flexible specialisation discussion in the context of craft-based production in India. The remainder presents findings from a case study on Agra's footwear industry, undertaken in the winters of 1990-91 and 1992-93. We start by briefly introducing the peculiarities of Agra's institutional setting (Section III), followed by a description of current employment conditions (Section IV). Next, we distinguish three possible roads ahead (Section V); focus on the feasibility of the most attractive option (Section VI), and aim to list some targeted policy contributions (Section VII). Finally, some concluding remarks are made in Section VIII.

II Thrashing Out a Useful Concept

The flexible specialisation debate feeds into a wider stream of literature on high versus low road industrial development [Hirst and Zeitlin 1991; Sengenberger and Pyke 1992; for a more critical view, see Storper and Walker 1989]. From the labour perspective, the low road is an organisational strategy in which leading actors see labour only as a cost factor, while in a high road leading actors see workers also as an asset [Sengenberger and Pyke 1992]. These distinct attitudes towards labour broadly mean that, while in the low road strategy leading actors will just try to minimise the cost of labour, in the high road leading actors realise that, in order to be able to achieve better quality and continuous quality improvement, employment conditions should incorporate elements of a socialisation process which will aim to impose a sense of overall responsibility on all specialised participants. In its stylised form, the high road relies on selective and durable collaboration between

specialists, resulting in a continuous quality improvement while maintaining flexibility. Similarly, in its stylised form, the low road is a desperate race for ever lower labour cost based on cut-throat price competition.

Asheim's definition of flexible specialisation provides an appropriate starting point "...a particular strategy for competitive success based on efficient and flexible production and marketing of quality competitive products..." [Asheim 1992:50]. Within the context of clustered small-scale manufacturing of artisanal products such a flexible specialisation strategy can be further operationalised as a premium-artisanal strategy, in which leading actors focus on volatile premium market niches that attach surplus value to quality-competitive artisanal products. Such a premium-artisanal strategy stands in sharp contrast to a sweat-shop strategy based on low quality, low cost products, and sweated labour. While a sweat shop strategy typically represents the low road industrial growth path, a premium artisanal strategy may deliver at least some of the benefits of the high road industrial development model.

The basic point for the subsequent discussion is that conditions of employment necessarily improve if leading actors are more oriented towards higher road strategies. This does not occur out of altruism, but because leading actors realise that, in order to achieve superior competitiveness in higher market segments, it is necessary to invest in labour and to stimulate collaborative interaction among actors. So, contrary to a low road attitude towards labour, a high road labour strategy simply requires a continuous two-way interaction between marketing and production. As skills in marketing and production are seldom combined in one person, more effective collaboration between actors with those distinct skills is seen as the key towards a higher road strategy. However, researchers on clusters in developing countries do not find an overall thrust towards innovation, continuous quality improvement

and good working conditions, as exemplified by the Third Italy case studies in Piore and Sabel's (1984) seminal work on flexible specialisation. But should we be surprised by that finding?

At first sight the recent European industrial district success stories from especially the Third Italy seem very relevant as an example for clusters in developing countries. These European industrial districts by and large share the following characteristics [Asheim 1994; Schmitz and Musyck 1994]. First, they tend to specialise in labour-intensive artisanal sectors, such as footwear, in which less developed countries are thought to enjoy a comparative advantage. Secondly, the industrial districts are built on local firms, mainly of small and medium size. Thirdly, these districts are situated in regions that were rooted in small-scale agriculture and industrialised relatively late. Underpinning the 'high road' success of these Italian case studies are a common set of cultural and social values, creating a 'collective identity' [Best 1990], where 'collaboration is in the air' [Ottati 1994] and where there is a scarcity of skilled labour.

However, often a much too rosy picture is painted of these Italian industrial districts [Schmitz and Musyck 1994], and even the most exemplary clusters do not live up to the flexible specialisation or industrial district model, if such a model exists at all [Harrison 1992; Rabellotti 1995]. Also in Europe many clusters follow a low road path [for examples of low road European footwear clusters, see Amin 1989; Benton 1989; Solinas 1988].

Moreover, and this is of course crucial, clusters in developing countries are embedded in a fundamentally different setting [Amin 1994], so that the chances for a higher road strategy in a developing country like India appear to be even smaller [Holmstrom 1993]. As recognised by Schmitz (1990), widespread poverty and a labour surplus impact negatively on the options for moving towards a higher road industrial development path. At the same time, social cohesion and the integrating role of local institutions, the pet themes in the industrial district literature, appear to be less prominent in clusters in developing countries. Instead, internal segmentation appears to reproduce and even strengthen inequalities. Because of extreme differences in bargaining power between actors in the cluster, possible benefits from collective efficiency are skewed in favour of leading actors and market agents [Smyth 1992]. In such an institutional setting, cut throat price competition combined with sweating labour appears to be a more likely outcome, as compared to quality-competitiveness combined with good employment conditions. This applies to craft-based Indian clusters in medium-sized towns

[Cawthorne 1995; Dupont 1994; Hariss 1982], as well as to less historically rooted clusters built on self-employment survival strategies in metropolitan areas [Alam 1994; Benjamin 1991]. Bangalore, with its hi-tech focus, may well be the exception to the rule [Holmstrom 1994].

Notwithstanding this overall trend, industrial clusters are often much more heterogeneous than recognised in the industrial district literature [Knorringa 1995]. Even in an overwhelmingly low road sweat-shop cluster like Agra we find some firms that follow a relatively high road premium-artisanal strategy. But before we turn to Agra's heterogeneity we introduce some of its overall characteristics.

III

Agra's Institutional Setting

Agra, India's most diverse as well as most tightly knit footwear cluster, is a prime example of an artisanally rooted low-tech cluster with predominantly small-scale manufacturing units. On an uninterrupted working day, some 60,000 production workers, employed in around 5,000 mostly informal small-scale manufacturing units, produce approximately 3,00,000 pairs of footwear [Knorringa 1994]. Far gone are the days that a mass of homogeneous home-based artisans supplied only a few designs to traders. Agra now holds all kinds of specialisations, and inter-firm division of labour has modestly started to develop. Many varieties of footwear are produced in all sorts of manufacturing enterprises: modern small-scale factories with conveyer belts, workshops using a mix of modern and traditional technology, or home based units with only one or two manually-powered machines. Moreover, apart from a wide variety of potential buyers for both finished and intermediary products, inputs are widely available from nearby firms.

Notwithstanding this heterogeneity, Agra is (inter)nationally known for its specialisation in built-up shoes with leather-uppers, for which roughly three main segments may be distinguished that partly overlap. The first, supplied by sweat-shop firms, is a rock-bottom segment filled with loads of amazingly cheap and substandard shoes, mostly carelessly made copies of successful designs. The second and largest market segment, most efficiently served by large-scale fordist production methods, is standardised shoes, varying from low up to rather high quality, with relatively slow-changing designs. For the cheaper varieties, many leading actors have set up factories in 'low-wage' areas, undercutting classical fordism in costs, while taking some loss in quality for granted. As this strategy rests on cheap docile labour and leading actors regularly set up new production

facilities in ever lower wage areas, this strategy is often termed a runaway strategy. The third and smallest market segment, served by premium-artisanal firms, is the volatile premium segment, filled with exclusive and fashionable designer shoes.

Two additional institutional aspects paint the scene of Agra's footwear industry. First, the industry is characterised by an omnipresent instability that stems from the increasingly volatile nature of demand for footwear, climatical nuisances, and from a range of local work interruptions. Put together, many actors appear to drift from one disturbance to the next, and improvisation is the name of the game [Knorringa 1995]. Second, Agra's footwear industry, like most craft-based industrial cities in northern India, is characterised by a caste-based antagonism between an artisanal community that makes the footwear and a trader community that sells. Forward caste Hindus from Punjabi or Sindhi background, Sikhs and well-to-do Muslims dominate Agra's footwear trade, while footwear workers in Agra predominantly belong to the scheduled caste jatav community. The mutually felt hostility between makers and sellers has far-reaching negative implications as it impedes the crucial professional collaboration between the people with marketing expertise and those with artisanal skills. Up to the 1960s, production used to take place almost exclusively in home-based units, of which the jatav head of the household would sell the produced pairs to a local trader who would sell to outside merchants. Since the 1970s this traders' community, as well as some newcomers, started to set up more organised workshops and small-scale factories in which they employ jatav artisans, because they felt a need to control quality and progress of production more directly [Misra 1980]. Consequently the caste-based identity clash, that used to exist mainly between trader and producer, has sometimes shifted to relations within workshops and small-scale factories. What remains is the central chasm that runs right through the heart of the industry.

IV

Present Employment Conditions

In terms of employment, around 50,000 out of the estimated total of 60,000 production workers in Agra in the winter of 1992-93 faced the low road employment conditions so characteristic of a sweat-shop strategy. Most larger firms have started to follow a runaway strategy, while direct exporters and suppliers to domestic premium market segments serve leading actors who follow a premium-artisanal strategy. While both the share of runaway and premium-artisanal employment is small, it

is important to reveal their characteristics as their share in future employment may rise significantly.

SWEAT-SHOP RULE

Though employment conditions in sweat-shops are always informal, insecure, and low paid, there are significant differences between the home-based direct-sales segment as opposed to the workshops making to order. In home-based units that predominantly use family labour, employment relations are an inseparable part of household relations and no clear-cut conflict of interest exists about wage levels and fringe benefits. Rather different is the situation in workshops run by white-collar trade entrepreneurs with hired jataw workers. Entrepreneurs offer only piece-rate jobs for as long as a specific order lasts. On Tuesday morning jataw gang leaders, as well as a range of independent skilled workers, swarm out to see the order position in various workshops, try to get a work-order and negotiate piece rates. Logically, the cutters are the first to initiate work, but they disappear after one or two hours. Also other workers can now only initiate part of the work, due to the chain system of production. After finishing they also disappear. On Wednesday morning they come again and ask for an advance, after which they agree to finish the rest of the order in accordance with the time schedule: usually Friday, sometimes Saturday. On Saturday they also settle the account: piece rates for that week's order minus the advance.

Entrepreneurs' main complaint against workers is that they cannot be relied upon to conscientiously come to the workshop when an order is available. But workers, following their own livelihood strategy, try to serve more than one entrepreneur at a time to come closer to a full-time workload, just keeping entrepreneurs satisfied enough to continue with them when they have another order. Although no formal ties exist between workers and entrepreneurs, intricate relations of obligation, debt and patronage exist. An entrepreneur must offer advances to get workers to complete an order, a worker wants to have some but not too much debt to an entrepreneur to keep the relation going, and so on. Relatively successful entrepreneurs and artisans have to play this delicate game of give-and-take.

All in all, the employment conditions under sweat-shop rule effectively pass on overall instability to the jataw community. Within jataw families, a highly flexible household labour allocation adjusts to the instability of the footwear sector. In the overcrowded home-based segment of last resort, returns to labour are pushed to subsistence level, especially in periods when employment in workshops is less. When work is plenty extra

hands are almost always easy to find, while in lean times the little work is divided among many. In effect, without romanticising solidarity, poverty is shared. To and fro, extended family members share in each other's windfall gains, which acts both as a safety net as well as inhibits formation of financial buffers. Many jataws are continuously in debt, mostly to local moneylenders, which is not a new phenomenon [see Lynch 1969:51; Misra 1980:111].

However, even in lean periods hardly any jataw artisans even try to move to other industries. In recent years some jataws appear to have moved to producing readymade garments on piece rates, for which especially upper makers can use their sewing skills. Often, jataws only reluctantly take up unskilled jobs in other sectors, proud as they are of their hereditary skill [Waardenburg 1993:170]. At the same time, because of their 'polluted' caste background, they are mostly banned from jobs in, for example, the hotel and catering industry (important in Agra, as tourism is the second main source of livelihood).

Moreover, poverty sharing is further enhanced by a slow but steady inflow of rural artisans with family members in Agra. Rural footwear artisans face a structurally shrinking demand due to increasing competition from widely available (nowadays also rural) and accepted cheap plastic or rubber footwear. Besides, because of the ever higher prices paid for hides and skins, that are increasingly centrally collected and tanned in more modern, more value adding tanneries, less cheap leather is available to rural artisans [Naidu 1993].

From the 1980s onwards, a tightly knit group of wealthy families who form Agra's well-established footwear elite started to follow a runaway strategy. These entrepreneurs reached a point where they saw setting up conveyor-belt factories as the way forward. Why? To start with, they have access to the type of orders most efficiently produced under runaway conditions: large orders for standardised medium-quality shoes. But perhaps even more importantly, they were fed up with the presumed unreliability of jataw workers. A runaway set-up offers them a chance to get rid of their dependence on jataw skills because these artisanal skills count much less in a runaway environment. In line with a stylised runaway strategy, with factories straightforwardly run on Taylorist principles, especially women are hired for the labour-intensive small-finger jobs in upper making. Such jobs are more regular as these women get monthly wages, assuring them of lower but more regular incomes as compared to employment conditions under sweat-shop rule.

Some 25 direct export units follow a premium-artisanal strategy, together with some 70 firms who serve the premium domestic market, either as suppliers of leading traders from India's metropolitan cities or one of the large Indian footwear concerns. Direct export units are predominantly run by non-Agra rooted professionals who strive for a smashing career in footwear by means of running a flourishing and modernising firm in which they reinvest most of their profits. They offer better employment conditions, especially a higher degree of regularity. Direct exporters as well as suppliers of domestic premium shoes often enjoy an overloaded order portfolio, so that they can offer more regularity to workers. Moreover, they also actually do offer better conditions as entrepreneurs in this segment consciously aim to utilise the surplus value of cheaply available artisanal skills. Although jataw skills are widely recognised, they seldom really come to the fore as they usually work with third grade leathers, cheap components and rusty nails. Yet a visit to any of the premium-artisanal suppliers employing jataw artisans shows that they can deliver high quality output when given high quality inputs. Even more surprisingly to the well-established trader communities, here jataw artisans tend to work more conscientiously and come more regularly.

Still, professional outsiders and jataw artisans are not friends, they simply collaborate professionally, enabling entrepreneurs to cash in on the resulting increased quality standards. At the same time, jataw artisans also profit as entrepreneurs offer higher road employment conditions. Nevertheless, as compared to world standards, even in an industry known for its low wages [ILO 1992b], wages in Agra are again dismally low. Still, entrepreneurs who serve premium-artisanal leading actors offer the least low road employment conditions, and pay good wages by Agra standards. Moreover, these outside professionals are less inclined to treat jataw artisans with the throttling hostility so characteristic of the well-established trader communities.

However, we should not get carried away by this promising observation. To be clear, more successful industrial clusters in terms of economic performance do not necessarily follow higher road employment strategies, nor do more successful entrepreneurs necessarily pay higher wages. But we can conclude that, firstly, a reasonable degree of entrepreneurial success is a *sine qua non* to enable improvements in employment conditions, and, secondly, to survive in the volatile, quality-competitive but also highly rewarding premium-artisanal segment, it is in the well-understood self-interest of entrepreneurs to offer higher road employment conditions.

V Possible Roads Ahead

So far, we analysed existing employment conditions. In this section we look at a few options open to Agra's footwear industry and their likely employment implications. Although we continue to focus on employment aspects we also touch lightly on a few other possible industrial policy objectives: to increase total production and foreign exchange earnings, and to diversify the industrial structure. Three options emerge out of the three prevailing strategies.

The first option is to continue on the same footing, so that small-scale manufacturing units in Agra would remain to be hired predominantly for sweat-shop strategy orders. But stagnation means deterioration on two accounts. Slowly but surely, the historically most important market segment served by Agra's manufacturers, cheap hand-made leather-upper shoes for the impressive domestic market, is invaded by low-cost non-leather shoes produced in more capital-intensive factories. In this highly standardised, mass-market low-price segment, fordist production methods are unbeatable and will drive artisanal small-scale manufacturers more and more to niche markets. Some new employment opportunities may come out of indirect exports, the export variant of the sweat-shop strategy, but whether this would compensate the loss of employment opportunities in the domestic sector is hard to predict. Moreover, stagnation also means deterioration because the gap between the old Agra way of manufacturing shoes and new technologies and new strategies increases every year. More generally, the limited innovative capability of a sweat-shop strategy may well self-destruct in the long run [Benton 1989]. Therefore, the need to start a shift towards less low road employment and production methods becomes more acute each passing year.

Put together, a mere continuation of old practices would most likely result in a further deterioration of employment conditions: probably declining full-time equivalent employment opportunities for a growing community with limited alternatives. Not surprisingly, piece wages have not kept pace with inflation, but seem to be steady at best. At the same time, relative to employment conditions in traditional industries elsewhere in Uttar Pradesh, footwear appears to be not even among the worst. Nevertheless, if Agra continues on the same footing the footwear industry will fade away dismally, and employment opportunities, meagre as they may be, will fade away with it. This may take a long time, measured in generations rather than years, as the jatav capacity to absorb worsening employment conditions is

desperately high. The prospect of such an involuntary process provides a strong reason to look seriously at other options.

The second option would be a substantial increase in the share of runaway firms. As noted above, jatavs rarely find employment in these new factories, populated by cheap and docile women workers: either young unmarried women or older women that have fallen on hard times. Relatively few of them are jatav women. According to a sample of women workers in small-scale factories in Agra, 18 per cent of women workers were jatavs, while 55 per cent originated from forward caste communities [Sundaram and Rao 1993].

Important benefits may accrue from following a runaway strategy. To start with, the women workers involved may be able to learn some skills, earn an income, and as a result possibly strengthen their bargaining position at home. On a macro level, these increasing income opportunities for women may well contribute to a more equal income distribution. Secondly, a runaway strategy can for a certain period achieve a substantial production volume for both the domestic and export markets, and thus diversifies the industrial structure. Moreover, it makes use of accumulated trade and marketing skills of the entrepreneurial footwear community in Agra. Lastly, although the conditions of runaway employment are not very promising, they are in some ways better than sweat-shop conditions.

However, if a runaway strategy were to gain momentum in Agra, this would most likely lead to massive displacement of jatav artisans. This might have little overall effect on employment if the runaway strategy would result in a similar number of new jobs with similar conditions for new people. However, this is unlikely as the stylised runaway strategy is a short-term strategy in two ways. Firstly, as a rule women workers take up this employment for a specific period in their life cycle ("until I get married", "until my daughters are married"). Secondly, the job itself may not last for long, as the business is, after all, going to 'run away' as soon as an equally good but cheaper production location is found. Yet for a particular period a runaway strategy can be very successful, as shown in examples both from India itself, e.g. Madras and surroundings, and from other Asian countries like South Korea and Taiwan, and more recently China and Indonesia [ILO 1992a]. Still, quite apart from its inherent pros and cons, a runaway strategy is not the right solution for Agra's footwear industry. In following a runaway strategy, Agra would willingly forgo its main comparative advantage over other runaway footwear centres. Not using this comparative advantage means Agra would become just another cheap place to manufacture cheap

shoes. But Agra has more to offer leading actors. Agra's footwear artisans are not just cheap and abundantly available but they are also skilled.

The third and most attractive option would be a substantial increase in the number of manufacturing units that supply leading actors who follow a premium-artisanal strategy. This would utilise Agra's main comparative advantage: the abundant availability of skilled as well as cheap artisanal labour. Instead of displacing artisans it would increase options for artisans to get access to higher road employment opportunities. Moreover, it kills two birds with one stone, as it also means entering more quality-competitive market segments, thus achieving a higher value added per pair as well as a more diversified industrial structure. This leaves two questions: is such a shift feasible, and if so, how can policy interventions encourage such a shift?

VI Is Premium-Artisanal Manufacturing Feasible?

Feasible options exist to increase the share of premium-artisanal suppliers. Firstly, as shown above, it is in the longer term self-interest of local entrepreneurs to strive for an attachment to leading actors with a premium-artisanal strategy. Secondly, demand is booming for the cheaper varieties of premium-artisanal shoes that Agra is capable of supplying. Because of Agra's particular mixture of skills relative to costs, its manufacturers seem particularly suited to target the comparatively cheaper niches of the premium-artisanal segment, for which demand is especially high. Traditionally, premium-artisanal leading actors catered almost exclusively to high-income areas. More recently, two more options for marketing comparatively cheap premium shoes have emerged: exports to quickly growing premium segments in low- and middle-income countries, and the new premium market segment in India itself. As Agra can target this specific niche of comparatively cheap premium shoes, it need not compete directly with, for example, premium-artisanal manufacturers in Italy. Still, in this cheaper segment it does face direct competition from specific clusters in, e.g. Portugal, Brazil, and Mexico, but not so much from other centres within India. Therefore, promising markets exist, especially in east and west Asia.

To be able to operate successfully in such premium-artisanal segments actors need to be flexible, fashion-sensitive and quality conscious. Two main impediments appear to hold back a substantial shift in favour of premium-artisanal manufacturing. Firstly, precious few signs exist that the bulk of Agra's trade entrepreneurs recognises the

attraction of premium-artisanal manufacturing. As long as these trade entrepreneurs can make satisfying profits by maintaining a *status quo*, and continue just to sell, their complacent attitude is not likely to change. Sellers will most likely continue to squeeze out short-term profits, without investing at least some of the profits again in the development of the footwear industry, thus further eroding future options. The strongly felt antagonism between makers and sellers in Agra, without any sense of interdependence, impedes interaction between carriers of the two main types of knowledge available in Agra's footwear industry: production skills and marketing expertise. Both groups are flexible as well as resilient within their own environment, but the two worlds do not meet to combine their knowledge. This may well turn out to be a fatal drawback, as the quality of the interaction between marketing and production is a decisive factor in whether actors are able to live up to the requirements of premium-artisanal manufacturing. As long as the overwhelming majority of Agra's white-collar entrepreneurs and jataw artisans fight each other instead of the competition, they do not stand a chance of entering premium-artisanal manufacturing, and, consequently, jataw artisans remain trapped in sweat-shop employment conditions. Moreover, the few outside professional entrepreneurs that are involved in premium-artisanal manufacturing have not worked themselves up from cheap sweat-shop orders but were attached to premium-artisanal leading actors from the day they set up shop in Agra.

Still, we should not lose all hope. History shows that the very successful clusters of today often also experienced bitter internal struggles before becoming prosperous, notwithstanding the collective amnesia once success came their way [Sahel 1992: 225-29]. Clearly, many other clusters did not outgrow their internal struggles and faded away. So, even though we stress that the present lack of professional collaboration is not a historical inevitability, this is not to say that a break-down of caste prejudice is around the corner, but just to say that what appears forever today might be overcome, has been overcome in other places in other times. At present, however, precious few indications point towards bridging the gulf between these two groups in the foreseeable future.

Secondly, even if sellers and makers would be prepared to start a process of professional collaboration, they have a lot of catching up to do. There is no easy short-cut to get quickly from the present archaic work methods to the new production methods used in premium-artisanal manufacturing. Moreover, this gap increases year by year. It may prove too big a gap to jump in one stroke, from

sweat-shop production with its low road employment practices to premium-artisanal production with its high road employment conditions, as that is really a jump from one extreme to the other. The mental transformation needed may even be more daunting than the technical adjustments that need to be made [cf Humphrey 1993 on Korea]. For Agra, it may be more realistic to envisage a transition period of rather hierarchical but more stable and more professional employment relations.

Moreover, even when the two main direct impediments would have been overcome, the ultimate challenge lies in how actors in Agra will handle manifestations of the new. For example, a necessary but not sufficient condition to be able to enter and survive in premium-artisanal manufacturing is that all participants must be capable of carrying through last-minute changes in specifications. New and volatile markets simply do not allow leading actors enough time to standardise each and every activity, so all participants must be flexible specialists in their own field, able to judge and implement the consequences of any sort of change on 'their' activity.

Still, even in the most optimistic scenario only a rather small fraction of Agra's jataws would enjoy the higher road employment conditions of premium-artisanal manufacturing. At the same time, Agra's labour surplus hangs over the cluster like a sword of Damocles. Moreover, sweat-shop employment conditions are most likely to become more and more desperate. Therefore, any attempts to increase the share of higher road employment conditions must be supported by policies to ease the labour surplus.

VII Possible Policy Contributions

In our view, any appropriate industrial policy package for Agra's footwear industry needs to come to terms with the general finding that principal decisions that set the boundary conditions for employment in Agra are taken by leading actors, more often than not located far away, and anyhow elusive to India's policy-makers [Knorringer 1995]. Therefore, industrial policy-makers should unassumingly limit themselves to support an enabling environment [UNDP et al 1988]. In short, we propagate a two-sided approach to encourage a shift to premium-artisanal manufacturing. Firstly, support attempts to increase Agra's attractiveness to premium-artisanal leading actors. Secondly, support attempts to ease the undermining labour-surplus effect on higher road employment conditions.

At present, India's policies towards the footwear sector focus primarily on adjusting to an export runaway strategy [UNIDO 1990;

Sahasranaman 1993; Rao 1993]. Policy-makers and industrialists aim to prevent the actual 'running away' by slowly capturing more phases in the marketing and production chain and, subsequently, to move slowly but surely towards somewhat better employment conditions. Such a policy may be appropriate for India in general, as most of the better known firms have entered into the footwear industry from a leather tanning background. These firms are long standing suppliers of main European leading footwear firms. While the Indian firms previously supplied finished leathers, and before that semi-finished leathers, they now also prepare uppers and increasingly full shoes for these leading actors. In turn, these foreign leading actors assist in setting up modern runaway factories where cheap docile women work with modern imported machines. Consequently, industry associations and policy-makers tend to agree that policy efforts should concentrate on training good supervisors, providing basic skill training to women workers, as well as a range of other aspects like increased hide and skill recovery, and foreign trade deregulation. In order to slowly capture more phases in the marketing and production chain Indian manufacturers send out promising employees to learn up-to-date design and production techniques, like computer aided designing (CAD) and computer aided manufacturing (CAM). However, as shown above, Agra is a special case with its artisanally skilled labour as well as a broad entrepreneurial base with worldwide footwear contacts, and warrants a complementary policy effort. Evidently, increasing Agra's attractiveness to premium-artisanal leading actors is first and foremost a task for local actors themselves. Still, in a modest way, policy-makers may be able to contribute to various processes.

Firstly, by supporting attempts to strengthen cluster associations of specific groups of entrepreneurs and workers as that may provide 'real services' to cluster members. Such 'real services' are often mentioned as a crucial factor in explaining the success stories from, e.g., Italian clusters [Brusco 1992]. In Agra some sectoral associations do exist, notably an export manufacturers association and a domestic traders association, but these associations appear to be primarily lobbying devices of a few leading actors, instead of serving a collective interest. Also, a wide variety of small workers' unions exists, often built around a particular jataw 'big man' of high standing within his own neighbourhood and in nearby factories. Still, the influence of such patrons is predominantly limited to settling local work-related disputes as well as negotiating piece rates, advances, and festival bonuses with a few directly affected entrepreneurs. Although these local leaders

do sometimes temporarily join forces to fight a particular issue, as a rule they operate in isolation. Through the years, almost all attempts to arrange for a general footwear workers' strike in Agra were nipped in the bud by the very rapid increase in the number of 'scabs', a logical consequence of the hand-to-mouth existence of many jataw workers.

Secondly, policy-makers can contribute to achieving a more transparent and clear-cut legal infrastructure. Even though India boasts a well-developed legal framework, both domestic and foreign businessmen feel they cannot rely on rigorous enforcement of existing laws. To try to take an opportunist to court is a sure road to further losses on a deal, as one is most likely to get choked in the overburdened judicial bureaucracy. Moreover, many entrepreneurs complain about restrictions on importing particular components and specific flexible machines.

Thirdly, policy-makers may facilitate programmes for local actors to upgrade technology and artisanal skills. Agra harbours a number of local training facilities, mostly government-run and desperately short of funds, that teach outdated technologies to too few people. Larger firms as well as more modern small factories hardly recruit from these training institutes but send young and promising supervisors, managers or designers to courses in Delhi, Madras or abroad.

Fourthly, and most importantly, policy-makers should find ways to contribute to setting in motion a process of professional collaboration between makers and sellers. Clearly this is an extremely difficult task, full of hurdles, and will take generations rather than years. Initially, it may well be more realistic to focus on stimulating more outside professionals to set up shop in Agra.

VIII Conclusion

At present a low road sweat-shop strategy predominates in Agra's footwear industry. Moreover, for most of the year Agra experiences a labour surplus leading to a downward pressure on wages and a less acutely felt need to upgrade technologies. In this artisanally rooted low-tech cluster non-Agra rooted entrepreneurs who follow a premium-artisanal strategy offer better employment conditions, not out of altruism but because it is in their well understood self-interest. They can only survive in this volatile but rewarding segment by offering higher road employment conditions. The *sine qua non* for a sustainable premium-artisanal strategy requires a continuous and in-depth professional collaboration between artisans with production skills and traders with marketing expertise. Therefore, professional

collaboration between artisans and traders is a prerequisite towards a higher road growth path. However, in most of the clusters precisely this interaction is blocked, due to the existing caste-based antagonism. A substantial shift in favour of higher road employment conditions can come about only when local traders start perceiving the potential gains from starting a professional collaboration with artisans as more important as compared to its perceived social undesirability.

Only then do they at least stand a chance to face the challenges posed by the volatile but attractive premium-artisanal market segment, if they also sufficiently upgrade technologies and increase flexibility. If not, sweat-shops and runaway factories may bring low road employment to many and substantial profits to a few. At best, then, Agra would become just another low-cost manufacturing centre. Nevertheless, it would be a missed chance to kill two birds with one stone: to earn a position as a premium-artisanal cluster that realises a higher value added per pair and brings in substantial foreign exchange earnings, and which, moreover, offers higher road employment conditions to at least a significant part of supplementary-trained artisans for whom otherwise even more massive displacement looms. In all of this, policy-makers can play only a supportive and unpretentious role, as it is squarely up to Agra's footwear community itself to take up this challenge.

Notes

[The data for this chapter was collected within the framework of a project on 'Impact of Technological and Organisational Changes on Women's Employment in the Leather Footwear Industry in India', carried out by the Department of Human Geography, University of Amsterdam, the Netherlands and the Central Leather Research Institute in Madras, India. The project as a whole was financed by the Netherlands's minister for development co-operation. Additional funding was provided by the Netherlands Foundation for the Advancement of Tropical Research (WOTRO). - 1 It was Ami Sverrisson who first pointed out this need explicitly in a EADI seminar in Lund in 1992.
- 2 This is not to say that employment conditions are always good in the case of production for higher market segments, but just that they are better. While participants in a premium-artisanal strategy primarily enjoy higher road employment conditions, participants in a sweat-shop strategy always face low road employment conditions. Of course, even the very unattractive sweat-shop employment conditions should be evaluated against local alternative employment opportunities.

Flexible Specialisation

New Paradigm for Industrialisation for Developing Countries?

Subesh K Das
P Panayiotopoulos

The new paradigm for industrialisation has been developed based on experiences in the industrialised countries. This article examines whether flexible specialisation could be a new paradigm for industrial policies in developing countries with particular reference to the textile and the garment sectors.

THE concept of flexible specialisation was introduced by Piore and Sabel (1984) to explain why the industrial economies dominated by Fordist method of mass production (like US, France and Britain) are in trouble, while countries like Japan, West Germany and Italy which are adopting a more flexible production method were relatively flourishing. They challenge the mass production paradigm, which has dominated both theory and policy and point to the strength of the alternative paradigm – flexible specialisation.

The new paradigm developed from research on the advanced countries, but the debate about flexible specialisation is no longer limited to the rich industrial countries. It is also about, whether flexible specialisation offers a way forward for industrialisation in the developing countries. Here we evaluate the potential of flexible specialisation as a new paradigm for industrial policy in less developed countries with reference to the textile and garment sector. The two industries, the production of textiles themselves and the processing of these into clothing together account for over a quarter of all third world manufactured exports [Jackson 1992:4]. The industrial policy in this sector which is now passing through major technological and structural changes is thus of great relevance in the developing countries. Flexible specialisation to become a new paradigm has to satisfy certain conditions or has to achieve certain benchmarks. Here we examine whether flexible specialisation can achieve these in the textile and garment sector in the developing countries, where there is large labour surplus and whether it can be so desirable that it can be adopted by the developing countries in their industrial policies.

Piore and Sabel (1984) claim that we are now passing through an industrial divide. The path of technological development is at issue. There are two potentially contradictory strategies for growth in the advanced industrialised countries. The first is the dominant principle of mass production technology and the second is flexible specialisation, which is expected to offer more hope. Beginning in the mid-19th century mass production system grew to dominance.

The full-fledged version of the model was most marked in the US, which the other countries tried to follow. The central features of mass production are described below:

Product price is the key component of competitive strategy in mass production and the main attention is thus always to lower production cost. It needs market large enough to absorb the output of standardised products and stable enough to keep the resources continually employed. It involves large-scale units, with large investments in highly specialised machinery to produce large volume of standardised products. The factories are laid to accommodate this process of specialisation and standardisation and production lines are introduced to manufacture on a dedicated basis. The workers are narrowly trained, they are not required to have total conception of work. It is enough to know the particular tasks they have to carry out. There is top down flow of authority and information with management hierarchical and rigid [Piore and Sabel 1984:5; Schmitz 1989:8-9]

But towards the end of 1960s the high rates of productivity growth started to fall. The changing relative competitive position of the different industrially advanced countries indicate that success lies in flexible type of production. The central features of flexible specialisation are described below:

In flexible specialisation product characteristic is the key component of the competitive strategy. It involves greater product variety, with variation within products, greater quality of product and product innovation. The production has to react to fast changes in the market. The output is in small batches of customised products (collectively output may be large). The production is not standardised. The same machine can make a number of products (multipurpose machines), depending on demand. Greater flexibility of output requires changes in the work practices, and requires multi tasking and multi skilling of workforces. They are broadly trained and are required to have conception of work. The main strength lies on continuous innovation with knowledgeable workers. New flexible technologies allow a greater range of output. The factory layout are altered from dedicated lines and functional layout to flexible production cells. Relationship with other firms becomes

organic, which promote innovation and flexible just-in-time production, they are not required to maintain inventory. This is in contrast to mass production which requires to maintain buffer just-in-case anything goes wrong [Piore and Sabel 1984:28-31; Kaplinsky 1991b:4-5].

These are characteristics of an ideal flexible specialisation model, which is based on the experiences in the developed countries (Third Italy, Mitsubishi in Japan, etc). However there are differences in the relative significance of the various elements in the different sectors and in different countries. In practice the examples differ from this ideal model. The differences are more prominent in case of developing countries. It is difficult to give a clear-cut definition for flexible specialisation. Piore and Sabel (1984) introduced the term and then it has been refined or modified by others. Schmitz (1989) provides a narrow and a wide definition:

Its basic definition centres on technology, skills and output: (i) multipurpose machines, (ii) broad skills, and (iii) varied products. The...extended definition contains two further elements: (iv) innovation; more precisely the firms compete with each other not by sweating and casualising labour but through product and process innovation. And (v) local political forces which channel the competitive pressure towards permanent innovation [Schmitz 1989: 18].

The emphasis on innovation and local politics makes the flexible specialisation mode attractive. What appears that there can be no fixed and final definition of the term but its meaning is to be realised by the elite planners in the context of a particular industrial sector in an economy.

There may be many forms of flexible specialisation or we can say there exist many alternative paths to flexible specialisation. Piore and Sabel (1984) described four forms of flexible specialisation: (1) regional conglomeration of small independent enterprises also known as industrial districts; (2) the federated groups of large loosely allied enterprises; (3) solar firms holding smaller firms holding smaller enterprises in steady orbits; and (4) internally decentralised workshop factories. Schmitz (1989) and

Kaplinsky (1991) grouped different forms into two major alternatives, small and a large firm variant of flexible specialisation. Here, we describe the two forms of flexible specialisation which are of relevance with respect to textile- and garment-making industry in the developing countries.

Industrial district: This consists of 'more or less equal small enterprises in an area or region bound in a complex web of competition and co-operation'. This involves co-operation between small firms and sharing of indirect costs, such as marketing, design, raw material procurement, maintenance of machinery. The most striking example is in Emiglia-Romania region of Third Italy, where the small-scale units developed into a growing network of small firms adopting both traditional and computer-based technologies. They used their collective capacities to devise innovative products, that gave them increasingly independent access to markets [Piore and Sabel 1984: 17; Schmitz 1989: 6,7].

Solar system: Here the parent company devolves a range of manufacturing operations to it orbiting suppliers, sometimes but not always owned by the parent company, which markets the final product. An example of this is S R Geni, Marks and Spencers – largest contractor combines centralised design and cutting – and a satellite of sweating factories [example from: Panayiotopoulos 1992: 44].

GARMENT-MAKING AND CLOTHING COMPANIES

In clothing industry the work still requires a good amount of complex tasks, which are difficult to automate fully. About four-fifths of the labour time is in the sewing stage, using sewing machines, which has hardly changed since its invention. The Japanese have tried to establish automated sweat shops, but they are unlikely to be commercially viable in near future. The relatively simple, low technology production methods, low start-up costs and their need for large amounts of labour have given the poor countries a comparative advantage in this sector. The fact that raw material and finished product can be easily moved around, also makes it ideal for export industry. Excluding trade between EC countries, the developing countries account for 66 per cent of world clothing export and out of 15 major exporting countries eight are now from developing countries [Jackson 1992: 8-9; World Trade Organisation 1995: 124].

The western clothing companies play a major role in the development of export-oriented garment industry in the developing countries. In recent years, globalisation and flexibility have been the watchwords for their production method. This involves responding to consumer fashion demand and at the same time making use of cheap labour

in the third world countries, by contracting out most labour-intensive work. There are three employers involved: (1) principal, (2) operator, and (3) contractors. The principal employer supplies the raw material on consignment basis to the operator located in a developing country, the operator gets the work done by a number of contractors and subcontractors, who engages workers including home workers. After the work the operator re-exports the finished goods to the principal employer, who sells it in the market. Here are some recent examples of such changes. In India DCM, a traditional textile mill company has entered into a joint venture with Benetton of Italy to start a knitwear factory in India. Mother Care of UK and Marzotto of Italy have also entered into agreements for joint ventures [Khanna 1994: 89].

Technology and market changes have been the key to shaping this global pattern. Computer-based communication system enables them to maintain close relationship with suppliers. The parent company gets involved at every stage, which includes procurement of fabric, improvement of production cost and product innovation. For example, Marks and Spencer is involved in the entire production chain from sericulture in China, spinning in Italy to dyeing, finishing and finally garment-making in the UK. The final product may even be sold in Hong Kong [Barnes 1994: 142].

The production for the domestic market in India is also in the small-scale sector and the production method is almost similar. The only differences are in the scale of operation, quality of products and the size of the organising firm. The merchants hold bulk of the production capacity who organise production across a number of firms [Khanna 1994: 87]. If we look at this from the perspective of a developing country, then what we have is clusters of small firms having some characteristics of flexible specialisation.

The textile district of Prato in central Italy gives a glowing example of introduction of industrial district model of flexible specialisation in textile sector in the 1960s. Piore and Sabel (1984) explained that the success of Prato since in terms of employment and export rests on reorganisation of production from large integrated mills, which united spinning, weaving and finishing under

one roof, to technologically sophisticated shops – specialising in various phases of production. Technological innovation, constant subcontracting and search for new products became the startling features of the industry.

Though the developed countries still continue to dominate the world textile export, the share of developing countries is clearly showing an increasing trend. The textile industry in the developed countries went through many technological changes in the last two decades, which the developing countries are now trying to follow. The Indian textile industry is a classical example of a large multi-sectoral industry in transition within the developing economy. The textile and garment sector in India employ about 20 million people and contribute 20 per cent of total industrial output and 30 per cent of total export [Economic Survey 1995]. The shares of mills, powerlooms and handlooms in total fabric production during 1989-90 to 1993-94 are shown in the Table. This shows shift of production from mills to powerlooms. The production in handloom sector remained comparatively unchanged. This is not a recent trend, but has been taking place since independence [Leadbeater 1993: 226]. It has now become more prominent and rapid.

The changes that are taking place in the textile sector are summarised below:

- Bulk of the fabric production is now from powerlooms, which is showing an increasing trend.
- Production from mills is decreasing indicating shift of production from mills to powerlooms.
- Composite mills which combine spinning and weaving are disappearing.
- Spinning is emerging as an independent business distinct from weaving.
- Small-scale spinning units are the recent introductions (example: Tamil Nadu).
- Mills are contracting out their work to powerlooms.
- Merchants are organising production across a number of enterprises by supplying yarn and payment of conversion charges.
- This type of splitting of operation has been further facilitated by establishment of independent textile processing centres [Khanna 1994: 70-74].

This shift in production structure is represented in the Diagram. It can be argued

TABLE : PRODUCTION OF FABRICS

	1989-90	1990-91	1991-92	1993-94
Mills	2677	2589	2376	1990
Powerlooms	14007	16044	16089	19631
Handlooms	3924	4295	4123	5851
Total	20608	22928	22588	27427

Source: Government of India: *Economic Survey*, 1994-95.

that such changes are in many respect similar to what happened in Prato, discussed earlier. However, there are some differences, which raises the question about potential of the new paradigm for the developing countries.

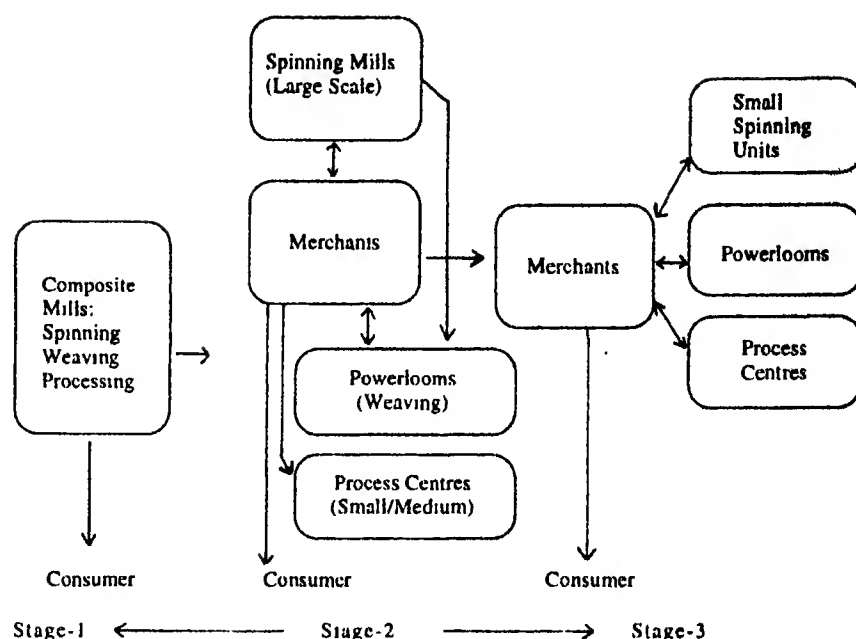

NEW PARADIGM

For flexible specialisation to become a new paradigm for developing countries it needs to achieve the objectives of growth with supply of high quality goods for the domestic and world market. The growth has to be continual. It is not enough for this to be a transient phenomenon. The main issue is whether it can provide continual improvement in efficiency, through continual innovation. According to Piore and Sabel (1984: 258) it is technologically dynamic enough to achieve this. They argue that flexible specialisation encourages competition that promotes innovation and prohibits the kind of competition that detracts from permanent innovation. We will examine here whether this can happen in developing countries.

Piore and Sabel (1984) have shown that in advanced countries flexible specialisation responded more successfully to crisis than mass production. It is this characteristic that makes the model attractive for the developing countries, where the small-scale units are more prevalent and are in an environment of chronic crisis. Agglomeration of small firms would offer few benefits even if they produce the same thing. Benefits arise when networks of suppliers develop, that provides materials, tools, machinery, spare parts and so on (examples: Americana, an industrial district in Sao Paulo and knitting industry in Petropolis). It is this sectoral agglomeration that partly enables them to overcome crisis and their 'resilience during crisis depend critically on collective efficiency and flexibility' [Schmitz 1989: 27-30].

Due to labour surplus in developing countries, competition frequently results from the sweating of labour, than innovation. There are examples from hammock making industry in Brazil, knitting or clothing industry in Petropolis, Americana in the state of Sao Paulo, where sectoral agglomeration was accompanied with low remuneration for labour [Schmitz 1989: 30-33]. The competition focused on minimising labour cost, through non-registration of workers and non-payment of national insurance or social security contribution. Schmitz (1989) explained that while such practice is possible for small firms, it is difficult for large firms. The above examples show how the small firms through unfair practices keep labour cost low. But this is even legally possible. In India, the workers in small firms (less than 10/20 workers) are not covered under many

DIAGRAM : STRUCTURAL CHANGE IN TEXTILE INDUSTRY

labour legislations (Factories Act, Gratuity Act, Provident Fund Act, etc).

The garment sector is more prone to worse exploitation of labour. There are even examples from developed countries. The study of ethnic minority enterprises engaged in garment sector in London shows that most of the firms, who operate as cut, make, trim (CMT) outdoor units of large manufacturers or contractors are characterised by "massive under-reimbursement of workers, particularly the home workers, who are becoming more central to organisation of production" [Panayiotopoulos 1990: 297].

It is not only that workers in small firms are paid low wages, but they also use machines which are of inferior technology compared to those used in the large firms. For example, in India most of the powerlooms, which developed in clusters "used same type of technology with somewhat cheaper non-automatic looms than used in the mills... wage level significantly less than half the mill wage" [Suri 1988: 238]. The quality also suffers, since the parent firms pay at piece rates, the main concern becomes quantity rather than quality, which suffer further because of low wages [Schmitz 1989: 33]. There are, however, exceptions (Liberaki's example), where small-scale industries in developing countries have successfully embarked on high technology, high quality route by combining innovation with sweat labour [Schmitz 1989: 33]. But in most cases the empirical evidences indicate that a high labour surplus leads to sweating of labour in place of innovation.

Innovation for continual improvement is also the main challenge for firms in transition,

shifting from mass production to flexible specialisation. Kaplinsky (1991) pointed out that so far only few non-Japanese firms have been able to master the shop floor organisation which facilitates incremental technical change. It is thus unlikely that firms in developing countries operating at a lower level of technology and communication network will be able to achieve this. His case study of Sunnyface Garments in Cyprus indicates that there was major improvements in competitiveness at the point of transition. But the firm was not able to tackle the process of continual technological change based on work improvement.

Piore and Sabel (1984) argued that flexible specialisation involves participation of workers in work conception and opens up long-term prospect for improvement in working condition. We have discussed that in a labour surplus economy this is unlikely to happen. Employment in small firms makes them move vulnerable to exploitation.

Flexible specialisation encourages segmentation of the workforce between a 'core' and a 'periphery'. The workers in the parent company are in the core with high wages (example: designers in garment-making industry), while workers in the peripheries are low-paid (home workers in garment-making industry) and more prone to exploitation. There are many examples. The development in Cleopatra Fashions indicates creation of such segmented workforce [Panayiotopoulos 1992: 68]. Batik industry in Indonesia is another example, where home-based women workers in the periphery are poorly paid [Galhardi 1995: 124]. The issue

of divisions between core and periphery is more prominent, if restructuring of firms leads to shift of work from mill to periphery, with fewer workers working in the mill and thus becoming a source of dispute. In terms of employment generation it is difficult to make any generalisation. A low road strategy (competition through low wage) will create demand for unskilled and casual labour. A high road strategy (constructive competition with high wage) will require skilled and semi-skilled labour.

We find that in developing countries, the lack of institutional framework necessary to promote co-operation and stimulate innovation is the major obstacle in the emergence of flexible specialisation. The industrial district experiences speak about three types of institutions – effective local governments, association of small firms and trade unions. According to Piore and Sabel (1984), the local governments in these industrial districts provided industrial infrastructure and collective services to encourage co-operation between independent producers, which enabled “peaceful merger of co-operation and competition”. This raises question of theory. The collective support provided to flexible specialisation firms may conflict with the functions of the entrepreneurs as competitors. Further, in a developing country context it can be said that “civil society is weak and the necessary political institutions like local government based on widely shared ideas of common goods are not well developed” [Holmstrom 1993: 85]. There are also problems in development of effective associations of firms in developing countries. The main stumbling block lies in competitive individualism of small producers. The solidarity of small firms is often based on kinship, which excludes outsiders [Holmstrom 1993: 85].

Study of four European regions by Schmitz and Musyck (1993) indicates that strong labour unions have contributed to competitive behaviour, which favour innovation, and blocked the low road to competitiveness. But in developing countries, labour is vulnerable to exploitation, specially in small firms, and unions are weak in this sector. The study also shows emergence of coalition between local government agencies, association of small firms and workers' organisations. Such coalitions were not free from internal conflict but they played a positive role [Schmitz and Musyck 1993: 37]. But lack of trust between businessmen, politicians and civil servants is quite common in a developing country, which often make such a coalition difficult and may even block innovation.

The basic objective of an industrial policy of a country is to create a dynamic and diversified industrial sector that can contribute to overall expansion of the

economy and solve many pressing economic and social problems. It covers a wide range of issues including trade, allocation of finances between enterprises and the roles of the large and small firms. The policy cannot be viewed in isolation of several broader issues like macro-economic adjustment programmes, privatisation, the changes in the global trade and the restrictions imposed by Multi-Fibre Agreement. It has to also take into consideration that the large firms like Benetton, effectively control the functioning of the small firms. The characteristics of small firms and even their existence mainly depend on the policies of the large firms, which very few countries can influence.

Supporters of flexible specialisation (e.g. the ILO and UNIDO) will argue that this new paradigm is so desirable that it should be one of the main guiding principles for the policy-makers. The policy must prescribe measures to promote industrial districts and support restructuring of industries, for shifting from mass production to flexible specialisation. Here, we examine whether government through industrial policy at micro (local), meso (regional) and macro (national) level can promote flexible specialisation in this sector.

If we consider restructuring of a large firm (like composite mills transferring weaving

operation to powerlooms outside the industry), then such a move will cause loss of jobs in the mill and are likely to be opposed by the trade unions. It is unlikely that provisions for such restructuring will be adopted in the industrial policy. In India restructuring of textile mills is a major area of conflict between the management and trade unions. The Greater London Council's London Industrial Strategy showed attempts by a local authority to promote flexible specialisation. Though the aim was to restructure for labour, the experiences show little regard for such a social package and thus raises the question whether such an initiative can promote flexible specialisation in the style of the ideal models [Panayiotopoulos 1992: 56]. However, governments with an affinity for labour may find this policy of 'restructuring for labour' quite attractive as their industrial strategy which takes into consideration the interests of workers in the promotion of small firms.

Schmitz and Musyck (1993) examined the role of institutions in the industrial districts of four European regions. They found that “none of the industrial districts are result of planned action, of a local or regional industrial strategy. They all developed spontaneously. Public and private sector institutions did play a role in their growth process but they were not created by these institutions”

Industrial Growth and Stagnation

Edited by

Deepak Nayyar

A selection of essays presenting the main strands in the debate on industrialisation in India. The contributors analyse the factors underlying the deceleration in industrial growth from the mid-1960s to the mid-1970s and discuss the conditions and policies for a return to the path of sustained growth. Alternative hypotheses about the macroeconomic determinants of and constraints on industrial growth in India are examined, focusing on the performance of the agricultural sector, intersectoral terms of trade between agriculture and industry, disproportionalities within and between sectors, the level of investment in the economy, the nexus between public and private investment and the relative significance of supply and demand constraints.

[Schmitz and Musyck 1993: 31, 35]. This leads to the argument that government cannot create an industrial organisation which from the beginning competes on the basis of collective efficiency. However, once there is a minimum concentration of industrial activity they can play an important role in helping the industry to innovate and expand. Provisions for two major resources (1) space and (2) producer services, through establishment of export processing zones, techno parks, etc., in developing countries have encouraged development of small firms in clusters (e.g., Kumasi in Ghana). Here, collective efficiency will not arise immediately but may emerge at a later stage [Schmitz and Musyck 1993: 32].

The Industrial District experience in Europe points towards a new model of local and regional industrial policy. It involves delegation of functions to local government and encouragement of local institutions. This has contributed to a general shift in the recent European industrial policy debate [Schmitz 1989: 36]. But lack of institutional development is a major problem in developing countries. The small Urban Producers Programme by ILO and UNDP, implemented in Mali, Rwanda and Togo, is an example of attempts to promote and encourage such institutions [Galhardi 1995: 126].

In Piore and Sabel (1984) model of flexible specialisation there is no discussion about institutional conditions at macro level. Little can be learnt from the industrial district experiences about the macro policy environment [Schmitz 1989: 34]. The evidence only indicates that the success was not the result of any centrally administered incentives for a particular region. But macro-economic policies are important, specially in the context of developing countries.

CONCLUSIONS

We started with a brief discussion about the characteristics of mass production and flexible specialisation. It was followed by a short description of the flexible specialisation models – those relevant in the textile and garment sector. The existence of different models of flexible specialisation leads to differing objectives. The options include 'restructuring for capital' (e.g., Japanese system) or restructuring with also labour in mind (e.g., Prato, approach of Greater London Council). A government with affinity for labour may find restructuring for labour an attractive strategy, while another country may choose the other alternative.

The recent changes in the textile and garment sector indicate the emergence of some of the characteristics of flexible specialisation. But they fail to satisfy some of the most important ones, specially those

relating to collective efficiency, continual innovation for continuous growth, institutional conditions, merger of co-ordination and competition and prosperity of workers. Lack of institutional development is one of the major bottlenecks for emergence of flexible specialisation in developing countries.

Hyper competition of small firms in garment industry still leads to sweating of labour in place of innovation in the developing countries. The trend indicates that while in "low labour surplus region of south Germany and Third Italy the dynamic is more of high wage/high technology/high quality, in vast labour surplus LDCs the dynamic tends towards low wage/low technology/low quality" [Schmitz 1989: 33]. This raises questions about replicability of the model of the advanced countries to the clusters of small firms in the third world countries.

In developing countries, industrialisation in any form that can generate employment and provide a reasonable wage for workers will be desirable and attractive. The study shows, while there is little scope for development of flexible specialisation in the style of advanced countries, there is no doubt that it is better and more realistic than a separate small-scale sector. But if the choice is between large firms engaged in mass production and cluster of small firms, then large firms will be preferred by the workers if not the policy-makers.

There are doubts whether government initiative can create industrial organisation which will compete on the basis of collective efficiency, but it is clear enough that there is need for favourable policy at micro, meso and macro levels, for flexible specialisation to emerge in this sector. This issue is required to be further developed through empirical studies in developing countries. The market and technology may push the changes in certain directions, but the policy issues will depend on many other issues, the most important one is the political considerations and the influence of pressure groups.

NATIONAL INSTITUTE OF RURAL DEVELOPMENT

(An Organisation of Ministry of Rural Areas & Employment, Govt. of India)
Rajendranagar, Hyderabad 500 030.

National Institute of Rural Development, an autonomous organisation under the Ministry of Rural Areas and Employment, Govt. of India, is an apex Institution conducting research, training and consultancy in the field of Rural Development and has over 100 faculty members. The Institute is recognised as a Centre of Excellence providing inter-disciplinary academic environment. It annually trains about 2000 officials as well as non-officials engaged in the field of Rural Development. It also attracts scores of participants from the Third World for its international programmes.

The Institute invites applications in the prescribed form for the following posts

I. DIRECTORS : Four Posts

(Scale of Pay Rs 4500-7300)

General qualifications common to the posts of Directors :

- i) First or high second class Post Graduate Degree (55% and above) with Ph.D. in the relevant subject
- ii) 10 years' experience in teaching in a recognised University or training in a recognised Institute of which at least 5 years should be at the level of a Reader of a University or equivalent thereto.
- iii) Independent research experience with published books and research papers in the relevant field

Post-wise specialised qualifications briefly are as follows

1. **DIRECTOR** (Centre for Behavioural & Organisational Development) :
Psychology, Applied Psychology or any Social Science with specialisation in Behavioural or Organisational Development.
2. **DIRECTOR** (Centre for Information Technology)
Computer Science/Statistics and Diploma in Computer programming.
3. **DIRECTOR** (Centre for Agrarian Studies) :
Agricultural Economics or any Social Science with specialisation in Agrarian Studies.
4. **DIRECTOR** (Centre for Quantitative Techniques)
Statistics with data processing work for survey research in mini and micro computers

II. DEPUTY DIRECTORS : Thirteen Posts

(Scale of Pay of Rs 3700-5700)

General qualifications common to the posts of Dy. Directors :

- i) First or high second class Post Graduate Degree (55% and above) with Ph.D. in the relevant discipline.
- ii) 7 years' experience in teaching in a recognised University or training in a recognised Institute
- iii) Independent research experience in the relevant field.

Post-wise specialised qualifications briefly are as follows :

1. **DY. DIRECTOR** (Centre for Extension & Transfer of Technology) :
Agricultural Extension.

2. **DY. DIRECTORS** (Centre for Micro Planning) : Two Posts :

- a. **First Post** : Economics with Regional Planning/ Geography/Applied Geography.
- b. **Second Post** : Animal Husbandry/Dairy Science.

3. **DY. DIRECTOR** (Centre for Rural Industries & Employment) :
Economics/Commerce/Management
or
Engineering Technology relevant to Small Industry/ Agro Industrial Development.

4. **DY. DIRECTOR** (Centre for Human Resource Development) :
Any Social Science preferably Rural Development/Social Work/Social Welfare/Education/Social Anthropology.

5. **DY. DIRECTORS** (Centre for Panchayati Raj) : Two Posts :

- a. **First Post** : Political Science/Public Administration.
- b. **Second Post** : Public Administration/Political Science/ Management.
or
Cost/Chartered Accountant

6. **DY. DIRECTORS** (Centre for Institutional Building for Training) : Two Posts

- a. **First Post** : Any Social Science preferably in Education, Adult/Extension Education and Training.

- b. **Second Post** : Any Social Science/Management/ Statistics.

7. **DY. DIRECTORS** (Centre for Social Development) : Two Posts

- a. **First Post** : Sociology.
- b. **Second Post** : Cultural/Social Anthropology.

8. **DY. DIRECTOR** (Rural Economics) :
Economics/Statistics with specialisation in Regional Planning.

9. **DY. DIRECTOR** (Centre on Rural Documentation) :
First or high second class Master's Degree in any one of the Social Sciences with second class Degree in Library Sciences.

or
A Degree in Social Sciences with a first or high second class P.G. Degree in Library Sciences. Seven years' relevant experience in a special library of standing. Knowledge of library automation and generation of computerised data base.

III. DEPUTY DIRECTORS (Temporary) : Three Posts

General qualifications common to all the posts of Dy. Directors as cited in II above.

Post-wise specialised qualifications briefly are as follows :

1. **DY. DIRECTOR** (Centre for Social Development) :
Sociology/Social Work/Cultural Anthropology.
2. **DY. DIRECTOR** (Centre for Micro Planning) :
Economics/Applied Economics/Econometrics/Statistics.

3. DY. DIRECTOR (Centre for Human Resource Development) :
Psychology/Social Work/Social Anthropology/
Management.

IV. ASST. DIRECTORS : Three Posts
(SC-One, ST-One and General Category-One)
(Scale of Pay : Rs. 2200-4000)

ASST. DIRECTORS (Temporary) : One Post
(O B C Category) :
General qualifications common to the posts of Asst.
Directors :

- i) First or high second class P.G. Degree (55% and above) with Ph.D. in the relevant discipline in Social Sciences/Agricultural Sciences/Computer Sciences/Statistics.
 - ii) 5 years' experience in teaching in a recognised University or training in a recognised Institution.
 - iii) Research in the relevant field
- Age : Below 35 years

V. ASST. LIBRARIAN (SC Category) : One Post :
(Scale of Pay Rs. 1640-2900).

Essential :

- i) Second class Master's Degree, preferably in Social Sciences.
 - ii) Second class Bachelor's Degree in Library and Information Sciences.
 - iii) Two years' experience in Special Library of standing with practical knowledge of Library automation and generation of computerised data base
- Age : Below 30 years.

VI. ADMINISTRATIVE OFFICER (Scale of Pay
Rs. 2200-4000) : **One Post :**

For its North Eastern Regional Centre at Guwahati.
The post is to be filled up on Transfer/on deputation basis.

The qualifications prescribed for the above post are as follows :

Essential :

- i) A Degree from a recognised University with minimum five years' experience in supervisory/administrative position in Govt./Quasi-Govt./Academic or Autonomous Organisation with atleast three years in the Scale of Rs. 2000-3500. Should be conversant with Govt. rules and regulations/office procedures and administrative matters/maintenance of equipment, estate/hostel maintenance.

Age : Below 45 years.

The Administrative Officer is required to stay on the campus of the Regional Centre, Guwahati.

General Conditions :

1. Employed persons should submit their applications through proper channel. Advance copies/direct applications/incomplete applications will not be considered.
2. Mere fulfillment of the qualifications prescribed does not entitle the candidate to be called for interview. Institute

may shortlist the candidates as may be necessary for interview/selection.

3. No correspondence will be entertained as regards shortlisting, calling for interview, selection or appointment
4. The Institute reserves the right to relax any of the requirements i.e. age, educational qualifications, experience, etc. in exceptional cases.
5. Canvassing in any form will be treated as disqualification.
6. Candidates selected are likely to be posted at any place in India.
7. All posts are on **Contract/Contract on deputation** for a maximum period of five years except temporary posts which are for 2/3 years only.
8. Suitable residential accommodation will be provided on the campus subject to availability.
9. All India Service Officers and other Senior Govt. Officers of both Central and State with relevant experience in the field of Rural Development are also eligible for induction into the faculties on contract which includes contract on deputation basis in which case relaxation of academic qualifications like Ph.D. will also be considered on merits.
10. The prescribed age of superannuation is 60 years for the employees of NIRD. Contract/deputation appointment will be upto the age of 60 years
11. Age relaxation for ST/SC/OBC is allowed as per G.O.I. rules for the posts where age is mentioned i.e. Asst. Directors, Asst. Librarian and Administrative Officer.
12. The Gross salary for each post at the Minimum and Maximum are as follows :

	Minimum	Maximum
Director	Rs. 11,955	Rs. 15,525
Dy. Director	Rs. 9,843	Rs. 13,605
Asst. Director	Rs. 6,788	Rs. 11,565
Admn. Officer		
Asst. Librarian	Rs. 5,200	Rs. 8,891

13. DA, HRA, CCA and other allowances as applicable to Central Govt. employees.
14. The Faculty Posts are on U.G.C. Scales of Pay.
15. **In meritorious cases, a higher start could also be considered.**

Prescribed application forms and information sheet with full details of qualifications, experience, job description etc. may be obtained from the Asst.. Registrar (Establishment), NIRD, Rajendranagar, Hyderabad 500 030 by sending IPO for Rs. 100/- (Rupees one hundred only) in favour of Registrar, NIRD, on or before **25.1.1997**. In case of SC/ST candidates, application is supplied free of charge on production of Caste Certificate.

Prescribed applications duly filled-in and supported by all relevant documents to be sent by Regd. Post should reach the Asst.. Registrar (Estt.) on or before **7.2.1997**.

Political Economy of Voluntary Retirement

Study of 'Rationalised' Workers in Durgapur

Ratan Khasnabis
Sudipti Banerjee

The article explores the mechanisms behind the workers' acceptance of voluntary retirement scheme in the Durgapur industrial area of West Bengal. Though there is willingness on the part of the workers to accept the compensation in some cases, there are sizeable number of instances of coercion from the management forcing the workers to accept the deal. More importantly, the amount of VRS gets mostly utilised for non-productive purposes, thus reducing the chances of the retired workers to begin any self-employment venture. •

I Background

SECTIONS 25(O) and 25(N) of the Industrial Disputes Act (ID act) of India make it necessary for an industrial organisation to seek government permission for closing down the establishment or retrenching labour.¹ As a part of the New Industrial Policy (NIP), the government of India (GOI) announced an 'exit policy' that would substantially modify the ID act so that along with free entry, the industrial organisations would enjoy the freedom to close down the unit or retrench labour as and when the management finds it necessary. A new industrial relations bill, incorporating easier rules under chapter V-B of the ID act for closing down an unit or retrenching labour was supposed to be introduced in the Lok Sabha in 1992. The said bill, however, could not be introduced due to political pressure from the organised labour. Under these circumstances, the government has opted for the second best. In both the public and private sector,² the government is now encouraging an early separation scheme known as the voluntary retirement scheme (VRS) that would help the industrial organisations shed off their surplus labour without having to face the legal complications associated with the relevant provisions of the ID act.

Under the VRS, the job contract can be dissolved for a price – a lump sum amount of money – which is more than the normal terminal benefit. Thus, the GOI has the VRS in operation, offering 45 days salary for every completed year of service or the total salary for the rest of the employee's tenure, whichever is less, as against 15 days salary to the employee in case of loss of job, as per the ID act. Several private sector organisations have also introduced VRS for shedding off their extra manpower. Some of them are quite attractive. An electrical company, for example, gives every employee opting for a golden handshake his gratuity and provident fund plus 80 per cent of the salary payable till the date of his retirement

[Datt 1993:75] However, more often than not the compensation in the private sector units is very poor and generally worse than that in the public sector units (PSUs). Thus, a field survey covering 10 non-PSUs and 11 PSUs in Durgapur industrial area reveals that on an average a rationalised worker in a non-PSU received Rs 0.40 lakh as VR compensation, the comparable figure in the PSU had been Rs 1.44 lakh (Table 3).

There is no rigorous study on how much the company gains out of the early separation scheme. Swaminathan S Aiyer, however, made an interesting observation in this context: "If a company pays Rs 500 crore in VRS, it saves Rs 200 crore annually in its wage bill, meaning [that] it is getting a whopping return of 40 per cent of its outlay. No other outlay can yield such a high return".³

The PSUs are the biggest target of the early separation scheme. Some estimates reveal that there is 25-30 per cent overstaffing in the PSUs [Datt 1993:75]. Keeping this in view, as a measure to ensure cost efficiency, the GOI has finalised a scheme that envisages rationalisation of about 4.5 lakh employees (about one-fifth of 23 lakh employees in 246 central PSUs). In 58 perennially sick PSUs, the target is to shed off 2.5 lakh workers.⁴ The biggest PSU to introduce this scheme is the National Textile Corporation (NTC). With 1.4 lakh workers, the NTC wants to make 75,000 persons retire in the near future. The next is the Steel Authority of India (SAIL) that has a target of retrenching 16,900 workers.

The GOI has formed a corpus fund for financing the early separation scheme in the PSUs. This fund is known as the national renewal fund (NRF). The guidelines of the NRF, as approved by the GOI on October 28, 1992, define the objectives and scope of NRF as (1) to provide funds for compensation of employees affected by restructuring and closure of industrial units, both in the private⁵ and public sectors; (2) to provide assistance to cover costs of retraining and redeployment of employees, necessitated due to modernisation, technological upgradation and

industrial restructuring; (3) to provide funds for employment-generation schemes both in the organised and the unorganised sectors.

The NRF is administered by the empowered authority in the department of industrial development, ministry of industries, GOI. The empowered authority consists of 11 members with the secretary (industrial development) as its chairman. The empowered authority decided to utilise a portion of the fund earmarked for employment generation to set up employment assistance centres (EACs) that would organise retraining and redeployment of the rationalised workers. Initially, the pilot schemes for EACs had been operationalised at five centres by different autonomous and non-government organisations. Subsequently, it was decided by the empowered authority to set up 31 EACs in addition to the existing five centres. These 36 centres would be operated by 11 nodal agencies.

The Indian Council of Small Industries (ICSI) is one such nodal agency which has been entrusted to set up six centres in four different states. The primary data which form the basis of the present study have been collected by the ICSI under the overall supervision of the present contributors.

PURVIEW OF PRESENT STUDY

In order to identify the target group, it was decided that each EAC would take up a quick survey followed by a detailed survey on the rationalised workers. Accordingly, four EACs,⁶ operating with ICSI as the Nodal Agency, have taken up the survey on rationalised workers in their respective catchment areas. The data pertaining to the rationalised workers are being collected by using a uniformly structured questionnaire administered by a set of trained investigators in each EAC. The survey is expected to gather a set of information on the socio-economic profile of the rationalised workers, the stated reasons of opting for voluntary retirement (VR), the ways VR-funds have been utilised so far and the post-VR

engagement of the rationalised workers. The present paper, however, is based on the data pertaining to one centre, viz, Durgapur (West Bengal) where the EAC has been commissioned in February 1996 and the field survey could cover 629 workers which is 83.86 per cent of the target (750 workers) for 1996-97. In other centres, the survey is yet to cover a reasonably good percentage of the target group of respondents. Hence, those centres could not be covered in the present analysis.

The Gandhi Labour Institute, Ahmedabad, took up a study covering 5,733 displaced textile workers in Ahmedabad [Patel 1988]. A recent study based on a smaller sample (250 displaced workers), taken up by Supriyo Roychowdhury (1996), also addressed the problems of the rationalised workers. However, this study was also confined to the displaced workers of closed textile mills of Ahmedabad. The present paper addresses the same set of issues. But this involves the rationalised workers of metallurgical, engineering and chemical industries, in both PSUs and non-PSUs, of Durgapur which is one of the newly developed industrial centres of eastern India.

The ICSI-sponsored study, of which only a part is contained in the present paper, has a wider coverage in the sense that it considers the displaced workers of four different centres spread over three different states. Again, the study is not confined to the closed units only. The displaced workers belonging to closed, sick and running industrial organisations as well have been brought under the purview of the present study. The coverage of this study is wider also in the sense that it spreads from coal mine workers of Dhanbad in Bihar to textile workers of Warrangal in Andhra Pradesh. It is, therefore, expected that the results of this survey, as they come out, would help one get a deeper insight into the political economy of the early separation schemes in India.

Coming back to the context of the present paper, it may be stated that in the remaining part of the present section we consider the methodological issues relating to the field survey. In Section II, we analyse the socio-economic profile of the rationalised workers in the Durgapur industrial region. The political economy of VR, including the post-VR profile of the rationalised workers, has been discussed in two subsequent sections of the paper. Needless to say, no generalisation can be made on the basis of this study because it is a region-specific study based on a small sample of rationalised workers drawn mainly from the PSUs in Durgapur.

It is difficult, particularly in case of the PSUs, to contact a rationalised worker after he leaves the job. Generally, in a PSU, the workers reside in its settlement areas. But

a displaced worker, living in the PSU's settlement areas, is supposed to hand over the residential quarter within three months after his claims have been settled. Under such circumstances, it is difficult to contact a displaced worker after his claims have been settled. In some cases, the workers from distant places go back to their native villages and towns immediately after the claims have been settled. The cost of surveying such persons being prohibitive, it is not feasible to cover those people in the survey even if their present addresses are available. Only such retired persons who have settled in the nearby areas and the workers who are still occupying the factory quarters can be covered in the survey. Here again, it is difficult to prepare an exhaustive list of such persons. As a result, a statistically regular sample cannot be selected out of the population of VR-workers in a centre.

The sample taken in each centre of VR-workers who could be spotted while visiting the nearby locality of such a centre. The survey personnel have been instructed to cover each of such persons without exception. These workers constitute the core of the sample. The second source of information has been the EAC itself. There had been awareness campaign organised by the EACs which induced a section of the VR-workers, not contacted by the investigators, to visit the EACs. This widened the coverage of the survey. Nevertheless, the sample cannot be claimed to be representative because the selection is not done on the basis of an ascertainable law of chance. It is a non-random sample which often goes in the name of 'convenience sampling'.⁷

Under the Durgapur EAC, there had been 629 respondents who could be covered in this way. The respondents had been interviewed with a set of structured questions, both open-ended and closed. It was a standardised questionnaire canvassed by a set of trained investigators. The data related to these respondents are being analysed in this paper.

II

Socio-Economic Profile of Rationalised Workers

In Durgapur, the survey in the present phase covered 629 rationalised workers out of which 602 reported to have opted for VR and the rest reported to have lost job due to closure and retrenchment. The overwhelming majority of the VR-respondents (572 out of 602) belonged to the PSUs (Table 1). The domination of the PSUs in the survey is largely explained by the fact that the employment in the organised sector in the Durgapur industrial region is largely accounted for by the state and central PSUs and that the PSUs introduced the VRS, following the NIP, in a big way.

TARGET GROUP

The age composition of the VR-workers described in Table 2 has a definite tilt in favour of the advanced age-groups.⁸ In the present sample, the concentration of VR-recipients in the advanced age-groups is explained⁹ by two sets of logic. For DSAIL,¹⁰ the productivity of which has improved remarkably following the modernisation of both DSP and ASP, a section of the workers failed to meet the new productivity norms. The management wanted to shed off this workforce by taking recourse to the VRS. By and large, the target group happened to belong to the advanced age-groups. It does not, however, seem that the axe of retrenchment due to modernisation would necessarily fall on the workers belonging to the advanced age-groups. In case of the non-PSUs¹¹ in Durgapur, where the (lack of)

TABLE 1: DISTRIBUTION OF SAMPLED RATIONALISED WORKERS IN DURGAPUR

Organisation	Voluntary Retirement	Other Kinds of Separation	Total
MAMC	470	0	470
DSAIL	60	0	60
HFC	20	0	20
Other PSUs	22	5	27
Non-PSUs	30	22	52
Total	602	27	629

Notes.

- A. 1 Out of 629 workers, 27 had been under the non-VR category.
- 2 DSAIL consists of Durgapur Steel Plant and Alloy Steel Plant.
- 3 HFC: Hindustan Fertiliser Corporation.
- 4 MAMC: Machine and Allied Manufacturing Company
- 5 Other PSUs consist of Bharat Ophthalmic Glass, Durgapur Project, Hindusthan Steel Construction, Rehabilitation Industries Corporation, Indian Iron and Steel, Hindusthan Refractories and Ceramics, and South Bengal State Transport Corporation.
- 6 There are 10 industrial organisations under the Non-PSU category.
- B: Out of 27 respondents reporting other kind of separation, 26 respondents had been affected by closure while 1 respondent has been affected by retrenchment

Source: Field Survey, 1996.

TABLE 2: AGE OF WORKERS AT TIME OF VOLUNTARY RETIREMENT (VR)

Age Group	MAMC	DSAIL	HFC	Other PSUs	Non-PSUs	Total
31-35	1	0	0	1	0	2
36-40	3	0	0	1	0	4
41-45	11	0	1	2	5	19
46-50	87	11	2	4	14	118
51-55	284	40	11	14	9	358
56-60	84	9	6	0	2	101
Total	470	60	20	22	30	602

Source: Field Survey, 1996.

productivity had been stated by the management as the consideration behind selecting the target group, it has been observed that more than 50 per cent of the workers belonged to the less-than-50 age-group. However, the weightage of the DSAIL being much higher than that of the non-PSUs in the sample, the age composition of the workers, who failed to meet the new productivity norms and opted for premature retirement, had a tilt in favour of the advanced age-groups.

In MAMC, which is a sick PSU with no definite plan for revival, it seemed that the management utilised the VR-fund that it received from the central government to make such workers retire for whom the management's obligation in terms of monthly wage compensation would be high. The (lack of) productivity was hardly a criterion. The management wanted to utilise the VR-fund in such a way that the organisation would get an immediate relief in terms of a substantive cut in monthly wage bill (a liability that the management of a sick unit would want to minimise). Even though the VR-compensation of the workers in the 50-plus age-group had been high,¹² most of the recipients of VR had been chosen from this group. It was a short-sighted decision. But it does not seem that this was unique to MAMC. In HFC, another perennially sick PSU, the rationale seemed to be the same. Consequently, in HFC also, there had been a tilt in favour of workers belonging to the higher age-groups (Table 4). In the absence of a definite scheme for technological modernisation, the management in HFC was in favour of seeking a respite by utilising the VR-fund for reducing the monthly wage bill.

In case of other PSUs, reporting 22 cases of VR, the managements' point of view could not be ascertained. From what the investigators gathered from other knowledgeable sources, it seemed that the lack of productivity had been one of the factors behind selecting the target group. One may note that 8 out of 22 workers had been selected from the lower age-groups in case of other PSUs. In sum, 59.46 per cent of the sample of VR-workers in Durgapur belonged to the 51-55 age-group. In MAMC, from which the majority of the respondents had been taken in this survey, the percentage of workers in the 51-55 age-group had been as high as 60.43 per cent. There is, however, a variation among the units in the age-specific distribution of the VR-workers. It seems that this reflects the variation in the circumstances under which the VRS had been introduced in these organisations.

On an average, a retired worker of Durgapur, opting for early separation, received a sum of Rs 1.39 lakh as compensation for job loss. This was lower

than the compensation rate projected for the surplus staff in 50 industrial and eight non-industrial public sector units [Ratnam 1992]. Table 3, however, indicates that the average may not portray the real plight of the typical VR-worker because there is a wide variation in the compensation sum both within and among the organisations. Thus, the VR-compensation in Durgapur varied between Rs 0.04 lakh to Rs 8 lakh. On an average, the VR-compensation in the non-PSUs have been a paltry sum of Rs 0.40 lakh. In MAMC, on the other hand, the average VR-compensation had been Rs 1.53 lakh. In DSAIL, the average VR-compensation had been Rs 1.14 lakh, while the comparable figure in the other PSUs had been only Rs 0.78 lakh.

Considering the VR-compensation along with other retirement benefits (provident fund, gratuity, etc), it appears that on an average the recipients in Durgapur received a sum of Rs 3.25 lakh. Here again, there exists a wide variation both among and within the organisations. Thus, in DSAIL the average compensation (considering both VR and other retirement benefits) had been Rs 2.84 lakh; in the non-PSUs, on the other hand, the sum had been about four times lower than this. A typical MAMC worker received a sum of Rs 3.53 lakh while opting for voluntary retirement. In the other PSUs and HFC the sum had been much lower.

The extent of variation is better captured in the coefficient of variation (CV) calculated with respect to each organisation under consideration (Table 3). It is observed that the CV had been 69.23 per cent for the VR-compensation fund for all the organisations taken together. The figures in parentheses of column 2 of Table 3 indicate that there had been a wide difference in intra-group variation in the amount of VR-compensation that the workers received. Thus, in the non-PSUs, the CV had been 172.24 per cent, while it was as low as 62.49 per cent in MAMC. The data also indicate that the intra-group variation was higher than the average CV for Durgapur in the other PSUs, DSAIL and HFC; but it was not as high as that in the non-PSUs. Considering the other benefits that the workers received while retiring from their respective organisations, one may observe that the intra-group variation in the non-PSUs measured in terms of CV had been about 3.5 times higher than the average variation in this group. Once again, it was the lowest in MAMC. Table 3 also indicates that the CV had been very high for the non-PSUs, if we consider the total compensation that a retired worker received. The CVs with respect to the total compensation had been remarkably close to one another in the PSUs covered in this survey.

The wide variation in VR-compensation and other retirement benefits among the

workers in the non-PSUs in Durgapur is largely explained by the lack of a uniform compensation policy both within and among the non-PSUs.¹³ On the contrary, both the intra- and inter-organisational differences in the CVs among the PSUs are low mainly because the PSU employees are usually exposed to a uniform VR-compensation policy; the normal retirement benefits are also usually uniform for all the PSU employees. The differences in CVs of VR-compensation among the rationalised workers in various PSUs seem to exist largely due to the variations of the tenure of the VR-workers in their respective organisations.¹⁴

GENDER, CASTE, EDUCATION AND SKILL

The organised sector in general and the PSUs in particular are dominated by the male workers. In the sample of rationalised workers in Durgapur,¹⁵ the percentage of male workers is as high as 94.12 per cent (Table 5). As Table 5 indicates, the inter-organisation variation in the gender-specific distribution of the VR-workers is also low. In India, there exists gender discrimination in the organised sector employment.¹⁶ The data indicate that

TABLE 3. AVERAGE RETIREMENT BENEFITS OF VR WORKERS
(Rs lakh)

Organisation	No of Workers	VR Compensation	Other Retirement Benefits	Total Benefit

operation of the VRS has not enhanced such discrimination in a significant way.

The rationalised workers in Durgapur are mostly Hindu upper caste people (Table 8). This is due to the fact that the employment in the organised sector in Durgapur is largely biased in favour of the Hindu upper caste. The skilled workers form 76.59 per cent of the rationalised workers, and the percentage of unskilled workers is as low as 8.44 (Table 6). The PSUs in Durgapur had generally been based on capital-intensive technology that required a set of trained workers to operate the sophisticated machines. Unlike their counterparts in jute and cotton textiles industries in and around Calcutta, the Durgapur workers had been mostly literate with technical qualification(s) and/or technical skill acquired on the shop floor.¹⁷ The data indicate that a high percentage (30.25) of the workers joined the organisations with a technical degree or diploma (column 3 of Table 8). Again, a reasonably high percentage of workers who did not have pre-acquired skill, did earn technical knowledge during their tenure in the respective organisations. This is true even for the non-PSUs in Durgapur where the percentage of unskilled workers has been as low as 17.31 (Table 7). Out of a total of 628 workers for whom the skilled-specific information had been available, the number of skilled workers had been 481, 19% of such workers joined their respective organisations with technical qualifications. The rest, which constitutes 46.18 per cent of the total workers, acquired skill on shop-floor.

Among the workers, the section with technical education gets a better promotional avenue within the organisation. However, the prerequisite for technical education is general education. The entitlement to general education stems from a reasonably good economic and cultural background which the people in the backward caste hardly possess. It is no wonder, therefore, that in the sample of rationalised workers, 14 out of 63 persons belonging to the Hindu backward caste are illiterate, whereas, out of 347 persons belonging to the Hindu forward caste, only 2 are illiterate.

The percentage of workers with an education level of secondary and above is 97.98 for the Hindu forward caste and the corresponding percentage for the Hindu backward caste is about 54 (Table 9). The figures in Table 9 definitely indicate that the caste-specific difference exists in terms of entitlement to education. The workers belonging to the Hindu backward, non-Hindu forward and non-Hindu backward castes have less entitlement to education than the workers belonging to Hindu forward and the Hindu OBCs. Between the 'Hindu forward' group and the 'Hindu Other Backward' group, however, the former group has an edge over

the latter group, although the gap does not seem to be wide.

As the members of the Hindu upper caste have better opportunity to get general education, and the prerequisite for technical education is general education, the technical skill is biased in favour of the workers belonging to Hindu upper caste. Table 6 presents this reality. The percentage of the skilled workers is 76.59, and 57.38 per cent of them belong to the Hindu upper caste. A columnwise scrutiny of the data in Table 6 indicates that the percentage of the skilled workers among the workers belonging to the Hindu backward caste is lower than the corresponding percentage in the upper caste. That this is due to lack of entitlement to education for the members of the Hindu backward caste is revealed in Table 8 which indicates that the respondents belonging to the backward caste catch up their counterparts in the upper caste as soon as they get the opportunity to have general education (Table 8: columns 4 and 6). If the members of the Hindu backward caste fail to come up, the data do indicate that it is due to the lack of opportunity ingrained in the socio-economic conditions in which they are placed.

Another interesting observation from the sample of the rationalised workers in Durgapur is that the difference between the respondents belonging to the forward caste and the OBC is not conspicuous in terms of

entitlement to general education (Table 9). In other words, it seems that they are exposed to a comparable set of social opportunities. Possibly, this explains the sociological phenomenon that, in West Bengal, the contradiction between the members of the forward caste and OBC is not as powerful as it is found to be in other parts of India.

Nine out of 628 respondents belong to the non-Hindu (Muslim) community. Most of them are literate and skilled workers. However, one need not read much out of these data because the respondents are quite negligible in this group.

III

Political Economy of Voluntary Retirement

VR as a measure to shed off the workforce whose marginal productivity is zero is introduced in an industrial organisation for maintaining its cost effectiveness in a competitive world. Usually this comes with technological modernisation that warrants the replacement of labour with capital. The technological modernisation improves the productivity of the existing workforce, so much so that a section of the workforce becomes redundant even when the modernisation enhances the installed capacity of the technology. The workforce that becomes redundant in this process has to be

retired. Since the organisation operates within the existing institutional framework that does not allow the organisation to shed off the redundant workers without adequate compensation,¹⁸ there comes an 'exit policy' the purpose of which is to minimise the cost of rationalisation under the existing institutional constraints.

ANALYTICAL FRAMEWORK

From the worker's point of view, one can envisage two alternative scenarios in which the rationalisation takes place. The first is one in which the compensation packet for the target group matches the expectation of the recipient so that there does not exist any element of coercion in the VR programme. In the perception of the VR-recipient, he earns full compensation due to the dissolution of contract by the management with respect to the labour time that he was supposed to sell in future. The problem here however is with the expected sum. Broadly speaking, the expected sum depends on the situation in the job market. If the individual worker has the expectation of getting a job elsewhere that would fully compensate for the loss he incurs in the present organisation, the expected compensation from the present organisation would be nil. If, on the other hand, the expected wage differential between the old organisation and the new organisation is positive, the expected compensation would be positive.¹⁹

In the absence of the alternative job opportunity, the expected compensation would be the capitalised value of his present wage over the time horizon of his remaining years in service. There would exist no element of coercion if the retired worker gets this amount of compensation. The problem arises when the sum offered by the management is less than the sum expected by the retiring worker. There may be two situations under this dispensation when the element of coercion is less pronounced. The first is a situation when the worker perceives a dissolution of contract under a situation when the organisation itself is facing a crisis, so much so that the worker cannot expect to get the entire amount of the capitalised value of his present wage as his compensation (in case of closure, suspension of work or lockout). The second is a situation faced by the workers of the advanced age-group. For such workers the dissolution of contract with a less amount of compensation may seem to be acceptable even for a running organisation because of a backward rising supply curve of labour at the advanced age.²⁰ The expected sum being low, the coercion may be less pronounced.

In sum, one can envisage a scenario in which, because of a complex set of reasons, the compensation packet may seem to be

attractive to the target group. The VR is enforced under such a situation with little extra economic coercion.

The alternative scenario is one in which the compensation packet does not meet the expectation of the target group. This happens largely in the absence of an alternative job option that can compensate the expected wage loss due to premature retirement. The worker's strategy in that case would be to refuse the VR packet and foil the management's move to dissolve the job contract. The management, on the other hand, would try to shed off the surplus workers by taking recourse to a labour policy that compels the workers to concede so that the job contract could be dissolved without hassles. A presentable sum of compensation coupled with a psychological pressure engineered from within the organisation may be the *raison d'être* for the workers to opt for early separation without creating political or legal hassles for the management. Dissatisfaction as regards the job, frustration with the pay and promotion policy, increasing work pressure or increasing pessimism about the prospect of the organisation may create a situation in which the victim could 'volunteer' to premature retirement even though the compensation packet does not cover the capitalised value of his present wage or whatever had been his expectation in this regard. Such factors may be noted as indigenous factors causing VR.

Such an analytical framework does not, however, cover a possibility in which the worker may settle for a low level of compensation for reasons arising out of non-economic factors operating from outside the organisation. Family problems, individual's aversion to work due to growing fatigue and psychological aberrations of the individual, etc, are some such factors that may induce the workers to withdraw from the job market with a low level of compensation. The expected compensation in such cases is low due to extra-economic factors but these factors operate mainly outside the organisation (exogenous factors).²¹

COERCION AS A CONTRIBUTORY FACTOR TO VR

An enquiry into the reasons for opting for VR, covering 602 workers in the Durgapur industrial region, revealed that there exists a combination of various factors driving the workers to retire voluntarily (Table 10). At the outset, the data indicate that 224 out of 602 workers have opted for VR with the stated reason that they did it willingly. In terms of the analytical framework outlined above, these are the cases of VR without any apparent coercion that the workers could report about. For some reason or the other, the compensation packet offered by the

management seemed to be reasonable to these workers. If we consider the organisational break up of such cases, it seems that DSAIL had the highest percentage of such VR-recipients. It seems that DSAIL had the policy of VR which did not have any coercive element in the perception of more than 80 per cent of its VR-workers. The percentage had been reasonably high in case of the other PSUs including HFC. Productively, the incidence of VR without coercion had been poor in case of the non-PSUs.

The alternative scenario in which the VR involved an element of coercion is, however, prevalent in the Durgapur industrial region. Out of 602 cases as many as 258 cases reported to have opted for VR not because the compensation amount had been attractive but because they were forced to opt for VR due to factors endogenous and/or exogenous to the organisation (Table 10). Thus, in the case of MAMC there were 211 respondents who reported that they had been coerced to opt for VR due to forces operating within the organisation. The factors that drove the workers towards VR have been recorded as frustration as regards the promotion policy, fear of transfer and apprehension of retrenchment due to possible lay off or closure and other kinds of victimisation. There had been six respondents in MAMC who cited political intervention, psychological pressure from the family, fatigue, and trouble engineered by the fellow workers causing, *inter alia*, loss of self-respect as reasons for opting for VR. Needless to say, these are not designed by the management to coerce the workers to accept the early separation scheme. If we note them as exogenous factors, altogether there are seven respondents who have opted for VR due to these factors. In MAMC, three respondents mentioned about the pressure from the management as well as from family as reasons for opting for VR. Two respondents from DSAIL belonged to this category. In case of the non-PSUs, 17 out of 30 respondents mentioned about the pressure from within the organisation as the reason for the decision to accept the early separation scheme. In case of DSAIL, HFC and the other PSUs, the incidence of coercion as a factor leading to early separation had, however, been low.

The data in Table 10 also indicate that out of 602 workers 13 could not furnish any specific reason for opting for VR; there had been 36 other cases where the respondents were not sure why they opted for early retirement. Most of such cases had been from MAMC where the management took a short-sighted view of retiring as many workers as possible by using the limited fund sanctioned by the central government so that an immediate relief comes to the organisation in terms of a reduction in monthly wage bill. It seems that these respondents (all belonging

to the 55-plus age-group) had been the victims of the confusing situation prevailing in MAMC.

It should also be noted that a fuzzy situation prevails in case of 73 respondents (3rd and 5th row of Table 10). There the decision to opt for VR had been the product of so many factors, some of which even seemed to be contradictory. Among these, there were 68 respondents who reported to have opted for VR both because they were willing and because, contradictory though, they had reportedly been forced by the organisation to opt for VR. The finding, however, is not surprising. In terms of the analytical framework developed in this section, everyone is willing to leave a job if he is adequately compensated for the dissolution of the job contract by the management. At the same time, nobody is willing to leave a job if he is not adequately compensated. The level of adequate compensation, which is notional and individual-specific, may be noted as expected compensation. If the gap between the expected compensation and actual compensation is positive, the respondent would be basically unwilling to leave the job. But his intensity of unwillingness depends on the magnitude of the gap. Given this logic, the worker is willing to leave the job, without having any coercion from the management, if the gap is zero. The worker is to be coerced to leave the job if the actual compensation is zero (the gap is equal to the full amount of expected compensation). Within this range, excluding the extreme values, every case of early separation is a product of both coercion from the management and willingness of the worker to retire voluntarily.

This gives a way to differentiate among the workers opting for VR. Since the retirement had been obtained by the management for a price (the actual compensation), there is no case of pure coercion in this set of respondents in the strict sense of the term. There are, in fact, 224 cases where the workers were 'willing' to leave the job. Since nobody leaves a job willingly unless he is adequately compensated, it seems that the gap between expected compensation and actual compensation is zero in these cases. In rest of the cases, except possibly in 49 cases with 'non-specific' and 'not sure' reasons of opting for VR, the early separation had been the product of both coercion from the management and a degree of willingness on the part of the workers to retire.

The difference, of course, exists even among these respondents. It seems that the 68 cases, with apparently contradictory reasons of opting for VR, are the cases where the gap between the actual compensation and expected compensation for job loss had been lower than what it had been in the case of other 246 respondents who reported to

have been forced to take early retirement exclusively due to indigenous factors.

To sum up, the element of coercion does not seem to exist in case of 37.21 per cent of the retired workers reported here. It will, however, be too much to claim that the rest, 54.15 per cent of the respondents,²² had been forced by the management to accept the early separation scheme. The reality is a product of both coercion from the management and willingness, to a certain degree, of the worker to retire under the early separation scheme.

IV Utilisation of VR-Funds

How are the VR-funds being utilised by the respondents? A survey on the rationalised workers in Ahmedabad reveals that most of the recipients of the fund failed to utilise it for productive purposes [Roychowdhury 1996]. The situation is not radically different

in Durgapur where the recipients had largely been workers with a reasonable degree of exposure to general education. If productive investment is defined as investment in individual's enterprise, it is observed that out of 602 VR-workers only 5 reported to have invested the fund exclusively for such productive purposes (Table 11). Four out of these 5 cases had been from MAMC and the other one was from DSAIL. The areas of productive investment had been individual service enterprise (4 cases) and small-scale manufacturing unit (1 case).

RISK AVERSION: SOME FACTS

It is observed that the large majority of the recipients of VR-fund opted for a portfolio in which there had been eight areas of utilisation of VR-fund,²³ none of which had been for the promotion of individual enterprise, i.e., such enterprise in which the investor is to bear the risk of investment. It

TABLE 8: CASTE-SPECIFIC DISTRIBUTION OF SKILLED WORKERS

Caste Category	Total	General Education up to Secondary Level (2)	Skilled with Formal Training (Out of Col 2) (3)	(3) as Percentage of (2) (4)	Skilled from Experience (Out of Col 2) (5)	(5) as Percentage of (2) (6)
Hindu forward	347	178	124	69.66	148	83.15
Hindu OBC	209	85	58	68.24	69	81.18

Source: Field Survey, 1996.

seems that the respondents had generally been risk-averse. Even when the funds had been utilised for income generation purposes, the typical mode of investment had been that in the interest-earning assets, such as Unit Trust of India's monthly income scheme, postal savings, etc, where the investor does not bear the associated risk of investment. Out of 594 respondents, 188 respondents have reported to have taken up investment venture in such non-risk-bearing areas, 147 of these investors had been from MAMC (which constitutes about one-third of the respondents from MAMC). In the non-PSUs, also, more than 50 percent of the respondents had reported to have taken up investment in such non-risk-bearing areas. Family commitments, including financial commitment for daughter's marriage, housing, repayment of previous loan and exigencies (mainly medical) had been the areas of unproductive expenses. These along with expenses on children's education account for 47 cases of utilisation of VR-funds. That the VR-recipients had spent their money mainly for unproductive purposes is also revealed from the data presented in row 10 of Table 11. There are 302 respondents who utilised the VR-fund in a combination of items none of which had been for enterprise building. The little bit of investment for income generating purposes that the respondents took up along with other items (described in columns 2 and 7 of Table 11) had been the investment in the non-risk-bearing assets.

There are 48 cases in which there had been some sort of productive investments out of VR-funds. These are the respondents who reported to have opted for the portfolio that contained investment for non-productive purposes too. Considering these 48 cases along with the 5 cases that reported utilisation of VR-funds exclusively for productive purposes, it is found that only about 9 per cent of the respondents may be described as risk-takers. Alternatively, as high as 91 per cent of the respondents did not find it prudent to invest their funds in risky ventures.

Inter-unit variation as regards the utilisation of VR-funds by the respective rationalised workers does, however, reveal some interesting facts. In the non-PSUs, 53.3 per cent of the respondents had reported utilisation of VR-funds for investment in the non-risk-bearing areas. Nobody in the Non-PSUs reported to have utilised the fund exclusively for productive purposes. There had, however, been one case in which a productive investment was reported, but it was a part of a portfolio which contained investment for non-productive purposes as well. In case of the other PSUs and HFC, the situation had been more or less the same. In HFC, however, not a single case of productive investment (even as a part of the

portfolio of a combination of both productive and unproductive investment) was reported. In DSAIL, we observe that the propensity for investment in productive areas had been reasonably good. Out of 60 respondents, six in DSAIL took up productive investment. However, five of them had opted for the portfolio containing both productive and unproductive investments.

To sum up, the compensation that the respondents received due to the cancellation of job contract had seldom been utilised for productive purposes. Even if there is a cultural difference with their fellow brethren in Ahmedabad, hardly had there been an enterprising endeavour among the rationalised workers in Durgapur industrial region.

RISK AVERSION: SOME NEGATIVE RESULTS

The lack of enterprising effort that has been observed among the rationalised workers in Durgapur needs a further analysis. The respondent's failure to invest the fund for developing individual enterprises may not be an indication of the lack of enterprising outlook *per se* among the rationalised

workers. The rationalised worker may have failed to develop an enterprise for self-employment not because he does not have the desire to do so, but because he does not have enough fund, after meeting the immediate commitments, to start an enterprise of his own. One may examine this hypothesis by considering the attitude of the respondents towards self-employment in the present economic climate, and assessing to what extent he is motivated to convince his family to bear the risk involved in enterprise building. In the remaining part of this study, we would take up this exercise by analysing first the perception of the respondents on the prospect of an individual venture in the prevailing economic scenario, and then considering whether they want their families to bear the risk of investment in areas of self-employment in such a situation.

The overall perception of the respondents as regards the risk involved in a self-employment project in the present economic climate has been captured by noting the reaction of the respondents to the statement that the present economic climate is not conducive to a self-employment venture, and then by assessing his opinion on whether

the family should bear the risk of developing an enterprise in the given socio-economic climate. The assessment was made by administering two statements and capturing the response of the individual respondent on a three-point scale.²⁴ Adding up the individual scores, we get the average for each group (the results presented in Table 12). The average score being (+)0.45, it seems that on an average the respondents in the Durgapur industrial region are inclined to agree, though not in a strong way, with the statement that the present economic scenario is not encouraging for self-employment venture.²⁵ It is further observed that the respondents are more inclined to the opinion that the family should bear the risk.²⁶ In other words, the responses with respect to the qualitative questions lead one to conclude that the respondents in Durgapur generally²⁷ believe that the economic scenario is risky; nevertheless, the respondents further believe that the family should encourage the VR-recipients to take up the entrepreneurial activities.

Table 13 captures this mindset of the respondents when it considers the respondents' choice as regards the areas of redeployment. Out of 629 rationalised workers, 259 are of the opinion that they should seek redeployment in the areas of self-employment. Considering the other 77 cases, in which the respondents are evenly poised between self-employment and wage-employment, it seems that self-employment is by far the more preferred area of redeployment of the rationalised workers of Durgapur. While it is true that the option for self-employment is partly warranted by the fact that the rationalised workers considered in this sample largely belong to the advanced age-group who have hardly any prospect of redeployment in the areas of wage-employment, it is nevertheless true that, instead of opting for a retirement from work (i.e. opting for 'should not work'), a sizeable section of these workers is psychologically prepared to try its luck in the areas of self-employment, even though this section of the VR-workers is largely aware of the fact that the economic scenario does not bear a promise for self-employment.

Why then did the rationalised workers not take up productive investment in a big way with the monetary benefit that they received after retirement? Why it is that not more than 9 per cent of the rationalised workers opted for a productive investment of their VR-fund? It seems that there had been more than one reason for this. First, the amount of VR-fund had been poor. The typical recipient started with a poor initial endowment²⁸ in the sense that his monetary benefit (VR-benefit, provident fund and other non-VR-benefit) had been poor for a self-employment project. Secondly, a sizeable section of the

retired workers had specific commitments in the areas of non-productive expenditure that they had to honour out of the meagre fund that they received after retirement.²⁹ This further reduced the available funds of these workers so that no effective self-employment project could be taken up by them. Thirdly, it seems that the target group did not have an immediate plan to retire. The retirement was thrust upon them by the management. As a result, even the workers who were less encumbered with other obligations and commitments did not have any self-employment project that could be commissioned immediately after the retirement. Thus, the recycling of funds, if at all, had to be taken up in the areas of short- or medium-term investments with assured regular income. This explains the poor performance of the retired workers in the areas of self-employment projects.

World Development Report (1995) observes:

Major transformations are associated with massive employment restructuring – many jobs must be destroyed and many new ones created. Both hires and separation increase dramatically during periods of major change creating turmoil in the labour market and uncertainty for workers [World Development Report 1995:108].

The structural adjustment programme in India warrants an employment restructuring that creates turmoil in labour market and uncertainty for workers. How does the organised labour face such a situation? On the basis of a field survey covering the rationalised workers in Durgapur, a relatively new industrial area in West Bengal dominated by the Leftist trade unions, the present paper observes that the workers in the organised sector have largely been coerced to accept the early separation scheme. The compensation that the workers received has been poor. Again, a sizeable section of the retired workers had specific commitments in the areas of non-productive expenditure that they had to honour out of the meagre fund that they received after retirement. The residual has been inadequate for starting a self-employment venture in the informal sector. Unlike what the World Bank report asserts, there is no sign of new jobs being created following the structural adjustment. As a result, it is more likely that this workforce would swell the reserve army of unemployed, thus enhancing the social cost of the structural adjustment programme in India.

Notes

statistical tables. Makhan Chandra Karmakar had been the computer assistant. While thanking them, we would add that nobody except the authors are responsible for the errors and omissions in the paper.]

- 1 Such permission is required to be sought by the establishments employing at least 100 workers. The provision was first introduced in the Industrial Disputes Act in 1976 for establishments employing 300 or more workers and was subsequently (in 1982) made applicable to those employing 100 or more workers.
- 2 However, the private sector units often flout the provisions of section 25(O) and section 25(N) of the ID Act by taking recourse to what is known as 'suspension of work' under various pretexts.
- 3 *The Times of India*, September 12, 1993; quoted in Singh (1995).
- 4 T S Papola, however, observes, "On the basis of the data on industrial sickness available with financial institutions, it was estimated that closure of chronically sick enterprises in the central public sector would involve redundancy of about 4 lakh workers. Similar estimates in case of large and medium private-sector enterprises were at around 5 lakhs" [Papola 1994: 12-13].
In a recent study, 'Structural Adjustment – Employment and Redundancy in the Organised Sector' (ILO – ARTEP (mimeo), New Delhi, 1993), Sudipto Mundle estimates the likely reduction in workforce due to restructuring and closures of central and state public enterprises and quasi-government organisations during the next three years at 1.1 million and that in private sector at 1.3 million [cited in Papola 1994: 13].
- 5 So far it has been used by the central government only for workers in the public sector units.
- 6 Out of the six EACs under ICSI in the first phase, the information pertaining to the rationalised workers is being collected in four centres, viz, Durgapur, Dhanbad, Warrangal and Vishakhapatnam. For technical reasons, the data related to two other EACs, viz, Bokaro and Tinsukia, could not be collected in the first phase of the survey.
- 7 Convenience sampling is a generic term that covers a wide variety of ad hoc procedures for selecting respondents [Green and Tull 1993: 210]. As in other non-probability sampling, in convenience sampling, there is no sound basis for estimating statistical confidence intervals around the sample statistics of interest.
- 8 VR is usually offered to a person with 40 years of age or 10 years of continuous service in the organisation. It is, therefore, unlikely that there would be any respondent belonging to 'under-30' age-group. In our sample there had been only 6 respondents belonging to the 'under-40' age-group. The large majority of the workers belongs to '50-plus' age-group which is noted here as advanced or higher age-group.
- 9 As transpired from the discussions with the management and other knowledgeable persons.
- 10 Two units under the Steel Authority of India

- in Durgapur, viz. Durgapur Steel Plant (DSP) and Alloy Steel Plant (ASP).
- 11 There have been 52 workers in this group from 10 organisations. There had been 30 cases of VR and 22 cases of other types of separation in this group
- 12 As noted in Table 4, the financial liability in terms of VR-compensation for the people in the advanced age group calculated on the basis of the following package is quite high compared to what a recipient in the lower age group is expected to receive. "Ex-Gratia 'payment equivalent to 1.5 months' emoluments (pay plus DA) for each completed year of service or the monthly emoluments on present rate at the time of retirement multiplied by the balance months of service left before normal date of retirement on attaining the age of superannuation, whichever is less" (Quoted from circular No 4/89 and 13/92 of MAMC)
- 13 Since there is no intervention from the government, there is no statutory obligation for the private sector organisations to follow a uniform VR-compensation policy. In reality, the private sector units work out their own VR-packages which are not uniform and generally worse than that in the PSUs. That there exists variation in the VR-compensation packages offered by various private sector units has been noted by other researchers [Ratnam 1992, Dutt 1993]. Our field data also indicate that there had been no uniform VR-compensation policy for the non-PSUs in Durgapur. The average compensation in the non-PSUs had, however, been lower than that in the PSUs (Table 3)
- 14 VR-package in the PSUs involves a payment of 45 days salary for every completed year of service or the total salary that an incumbent is entitled to get till his retirement, whichever is less. The other retirement benefits also follow the uniform pattern and contain:
 - a) The balance in his provident fund account on the date of retirement payable as per contributory provident fund rules applicable to him
 - b) Leave salary for the unavailed earned leave.
 - c) Gratuity as per gratuity act or the organisation's own gratuity rules applicable to the employee
 - d) One month's/three months' notice pay (as per the conditions of service applicable to him).
- 15 Henceforth, the analysis covers other kinds of separation as well unless we discuss the issues related to the VR-workers only.
- 16 Women constitute about 12.5 per cent of the employment in the organised sector as against 28 per cent of the total employment in India [Papola 1993: 50].
- 17 Among the rationalised workers in MAMC, more than 80 per cent had been skilled workers. Even in the non-PSUs in Durgapur, the percentage of skilled workers had been as high as 65.38 (Table 7)
- 18 In India, the institutional protection is enjoyed by the workers in the organised sector only. Organised manufacturing accounts for less than a third of the total employment in the manufacturing sector. It is this sector that has organised labour and to which most of the labour legislation is actually applied. It is here that surplus or redundant staff cannot be

- removed, and where discipline and productivity in many cases cannot be enforced. In the other manufacturing sectors as well as in most other employment, there is no job security, no indexation of wages through dearness allowance and no benefits relating to health care, etc [Rao 1994: 313].
- 19 If the expected wage differential is negative, the worker would leave the job without seeking compensation. The organisation may even seek a compensation for the dissolution of the contract. From the management's point of view, such workers should not be allowed to leave the organisation. The VRS, particularly in the PSUs, often failed to retain such workers because the policy is not implemented with an assessment about the expected wage differential of the workers.
- 20 The marginal rate of substitution between work effort and leisure increases not because the worker is affluent, but because he is unable to maintain his work effort at the given wage rate due to old age.
- 21 Strictly speaking, the environment at the workplace is also responsible for the worker's de-motivation and subsequent withdrawal from the job market. But in the present context, this is not designed by the management as a part of the VR policy. Hence, we distinguish between two sets of factors.
- 22 Cases belonging to the 'non-specific', 'not sore' and 'not available' groups taken together constitute 8.65 per cent of the total cases.
- 23 The areas include housing, including land for dwelling purposes, loan repayment, family commitments including daughter's marriage, investment in education, family exigencies, individual unproductive expenditure, investment in interest-earning (non-risk-bearing) and other (unspecified) areas of unproductive investment.
- 24 The statements had been (1) any self-employment project under the present economic scenario is risky; (2) the family should bear this risk because this is the order of the day. The attitude had been captured on an ordinal scale in which we put an arbitrary zero on 'undecided' and (+1) for 'agreeing with the statement' and (-1) for 'disagreeing'. With an assumption of distance equivalence as in ratio scale, we get a measure by aggregating the quantitative scores and finding the average of the aggregate. Thus, an average score near zero would imply that the respondents, on an average, remain undecided in their attitude with respect to the statement under consideration. Alternatively, a score near (+1) would imply that the statement received general approval and a score near (-1) would imply the opposite with respect to the set of the respondents [Kerlinger 1973, chapter 34].
- 25 For example, the average score in HFC is

0.15 and that in DSAIL is 0.72. The average score is, however, largely inclined to the average in MAMC because of the disproportionately high weightage of MAMC in the total sample. Inter-unit variation in response to the statement is also noteworthy.

- 26 Thus, the average score for all the respondents with respect to the second statement is (+) 0.5. In the individual units, the average score is varying between (+) 0.45 and (+) 0.60.
- 27 The results of two rows of Table 12 taken together seem to suggest that there is a consistency in answers with respect to each unit (except HFC). The scores with respect to HFC-workers appear to indicate that they did not think that the economic climate is too bad for self-employment venture. Even if this was risky, the respondents were inclined to believe that the family should bear the risk.
- 28 See Table 3.
- 29 See Table 11.

Juvenile Sex Ratios in India

A Disaggregated Analysis

S Agnihotri

This paper studies the regional variations in sex ratio patterns in India in the juvenile age group (0-9 years). Such study offers two major advantages; (a) the juvenile sex ratios (JSRs) are not affected by migration and therefore, (b) their analysis provides useful insights into patterns of differential mortality among children by sex. A disaggregation of these sex ratios into the 0-4 and 5-9 age groups brings into sharper focus the pattern of excess female mortality beyond the age of one year. This is a socially driven phenomenon as against excess infant male mortality which is essentially a biological phenomenon. The female to male ratio (FMR) in the 5-9 age group emerges as an appropriate parameter for analysis of the sex ratio variations across the country. It reveals significant differences in the sex ratio patterns among three major social groups, viz, the tribal, the scheduled castes and the rest of the population. It displays a remarkable spatial contiguity across different geophysical regions of the country. These regions turn out to be a more suitable unit for analysis of spatial variations in the sex ratios than the administrative units of different Indian states. Certain regions, cutting across the state boundaries, stand out for their alarmingly low FMRs. The observed patterns raise important questions about design of women and child welfare programmes and indicates the need for plurality in their design and for area and group specific interventions.

I

SEX ratios in India are highly masculine compared to most other regions in the world. The proportion of females in its population continues to decline and stands at 927 females per thousand men in the 1991 population Census. The female male ratios (FMRs),¹ however, are neither uniformly low nor uniformly declining across different regions in the country and show a considerable variation across these regions. These variations have attracted considerable attention in literature, dominated by one major feature; the 'north south' divide.² This refers to the highly masculine sex ratios in the north-western states and more favourable FMRs in the south-eastern states of India. Concern has also been expressed at the growing masculinisation of the sex ratios in the south-eastern states over the years [Miller 1989; Heyer 1992].

Apart from recognition of this 'divide', different correlates of these sex ratios have also been analysed; economic as well as socio-cultural. The economic factors have mainly been analysed in terms of female labour participation as a determinant of female 'worth' [Bardhan 1974; Miller 1981; Rosenzweig and Schultz 1982 and Meis 1988]. Recently, the role of capital in terms of dowry has also been examined in greater detail [Heyer 1992; Rao 1993; Wadley 1993; Kapadia 1994].

Studies of the role of socio-cultural factors has mainly focused upon the status of women shaped by culture [Dyson and Moore 1983;

Dasgupta 1987; Berreman 1993; Madan 1993]. Different kinship systems in the north and the south and the process of assimilation of a woman into the family of her marriage have informed the bulk of this analysis which has by and large been qualitative. In the absence of suitable quantitative data and analysis, the debate on the cultural aspects has not moved much beyond highlighting the north-south divide. Given India's cultural diversity, this is not adequate.³

This paper elaborates upon this regional diversity. It departs from the conventional analyses on four counts. It uses district level data. Further, it uses juvenile sex ratios (JSRs) instead of overall population sex ratios to cut down the migration 'noise'. It then disaggregates these among three major social groups – the tribal, the scheduled castes and the rest of the population. The sex ratio patterns among these three groups differ significantly – a point which has been consistently overlooked in the literature.⁴ Finally, the juvenile FMRs are broken down into 0-4 age group and 5-9 age group FMRs to capture the differences in the mortality patterns in the juvenile age group. The effect of excess male mortality during infancy gets reflected in the 0-4 age group FMRs while the 5-9 age group FMRs capture the excess girl child mortality in later years of the childhood.

The received literature uses state-level sex ratio data for much of its analysis.⁵ It also uses the all age group sex ratios, not corrected for migration. Differences in sex ratio patterns among the tribal, the scheduled castes and

the rest of the population have also not been systematically analysed. Separate analysis of the 0-4 and 5-9 age group FMRs has also not been done earlier.

We use the 1981 Census data, which has for the first time provided the five year age group break up for the scheduled tribe and the scheduled caste population. We use the data in respect of 355 districts based on the Indian District Development Database⁶ and the special tables for scheduled castes and scheduled tribes from the 1981 Census reports. As random fluctuations in sex ratios are large for small population sizes,⁷ we have not considered districts with very low population of tribal or scheduled castes in the analysis of the SC or ST FMRs. Districts in the north-eastern region have also been excluded from the analysis.⁸ Data from the 1991 Census for the five year age groups is yet to become available.

Using these data, we (i) show that the JFMRs are free from 'migration noise' which affects the all age group FMRs, (ii) bring out significant differences in the FMR patterns among the ST, SC and the rest of the population and (iii) show that the 0-4 and 5-9 age group FMRs differ significantly from each other. The 0-4 age group FMRs capture the excess male infant mortality, essentially a biological phenomenon, while the 5-9 age group FMRs capture the patterns of excess female mortality that set in during later years of childhood. These reflect the different extents to which the biological advantage of the female infant is 'reversed' beyond the age of one year in different regions mainly

FIGURE 1: COMPARING FMR VARIANCES
All age group and juvenile age group

through discrimination against the girl children which is a socio-cultural process.

The FMRs in the 5-9 age group show a remarkable homogeneity within different ecological or geophysical regions. These regions sometimes cut across the boundaries of different states and a state often contains more than one such region. It turns out that these regions provide a much more satisfactory basis of spatial analysis than the states. One immediate outcome of focus on these regions is the identification of a 'Bermuda Triangle' for the female child,⁹ a region cutting across districts of Haryana, western UP, three districts of Rajasthan and the ravines of MP with alarmingly low FMRs. This has important implications for the woman and child welfare policies and the design of interventions.

The paper is organised in five sections. Section II examines the suitability of the JFMRs over the all age FMRs in the context of migration. Section III elaborates upon the need to disaggregate the 0-9 age group FMRs into 0-4 and 5-9 age group FMRs and examines their broad spatial variation across different regions. Differences in the FMR patterns among the tribal, the scheduled caste and the rest of the population are highlighted. The regionalisation of sex ratios is examined in further detail in the next section, primarily in respect of the 5-9 age group FMR. Usefulness of grouping by geophysical regions over the states as units of spatial analysis is established. Final section summarises the implications and the scope for further research.

II

THE MIGRATION FACTOR

Analysis of regional variations in sex ratio patterns in India has often relied upon data not corrected for migration and continues to do so. While female migration in India mostly

arises on account of marriage, most of the long distance migration is heavily male dominated and arises out of economic reasons.¹⁰ High net male immigration in metropolitan areas, net male outmigration from Kerala or the male dominated immigration among the non-tribal population of some of the north-eastern states bear this out. This results in considerable variation in the FMRs at the district level, e.g., 772 for Bombay, 1032 for Kerala and, 558 for non-tribal Nagaland.

Juvenile FMRs do not suffer from such fluctuation as there is hardly any sex selective migration in that age group [see Miller 1981]. This can be seen by comparing the JFMR for Bombay; 934, compared to the all age FMR of 772 or the JFMR figures for the districts of Kerala (Table 1) with the all age FMRs not corrected for migration. Both Sopher (1980) and Miller (1981) have used the JSRs in their analyses of the regional variation of the sex ratios at the district level. Use of JSRs has nevertheless not gained currency in subsequent analyses and some of the debate about sex ratio variations still continues around the role played by migration.¹¹

Table 2 establishes this feature of the JFMR through comparison of variance for the all age group FMRs and juvenile FMRs at all India level. Variance of the JFMRs is considerably less compared to that in the all age group FMRs for the total population as well as its tribal and non-tribal segments. Districts with significant tribal population, i.e., above 5 per cent of the overall population yield similar result. The reduction is much sharper for the state of Kerala known for its pattern of net male outmigration (Figure 1).

The difference between the all age FMRs (mean 936.1) and juvenile FMRs (mean 957.8) is highly significant at 1 per cent level

and below (t-value of 7.93) as revealed by t-test for paired samples. That JFMRs are free from migration 'noise' can also be inferred by analysing the urban and the rural FMRs. The low mean for the urban FMRs; 895 females per thousand males compared to a mean of 946 females in rural areas is consistent with net excess male immigration in urban areas. The difference between these sex ratios; urban and rural, is highly significant at 1 per cent level and below (t-value of 16.3).

If sex selective migration between urban and rural areas is insignificant in the 0-9 age group, the rural and urban JFMRs should not differ significantly. This is indeed the case. The mean for the JFMR for the overall population in rural area 955 and that in the urban areas, 958, are close to each other and the difference between them is not significant at 5 per cent level (t-value of -1.76).

Migration data from the Indian census do not provide the composition of the migrant population in terms of social groups. A comparison of all age FMRs and the JFMRs among these groups, e.g., tribal or the scheduled castes can throw interesting light on the nature of migration among these communities. But this point is not pursued here further.

III

Once migration effects are eliminated, sex ratios are primarily determined by the male female mortality differentials. As such, the JFMRs will be determined mainly by the pattern of deaths among the children within the 0-9 age group.¹²

In India, a substantial portion; nearly 60 per cent, of the deaths in the 0-9 age group occur during infancy, i.e., in the 0-1 age group. Deaths in the 1-4 age group account for little above 30 per cent whereas deaths in the 5-9 age group account for the remaining 10 per cent.¹³

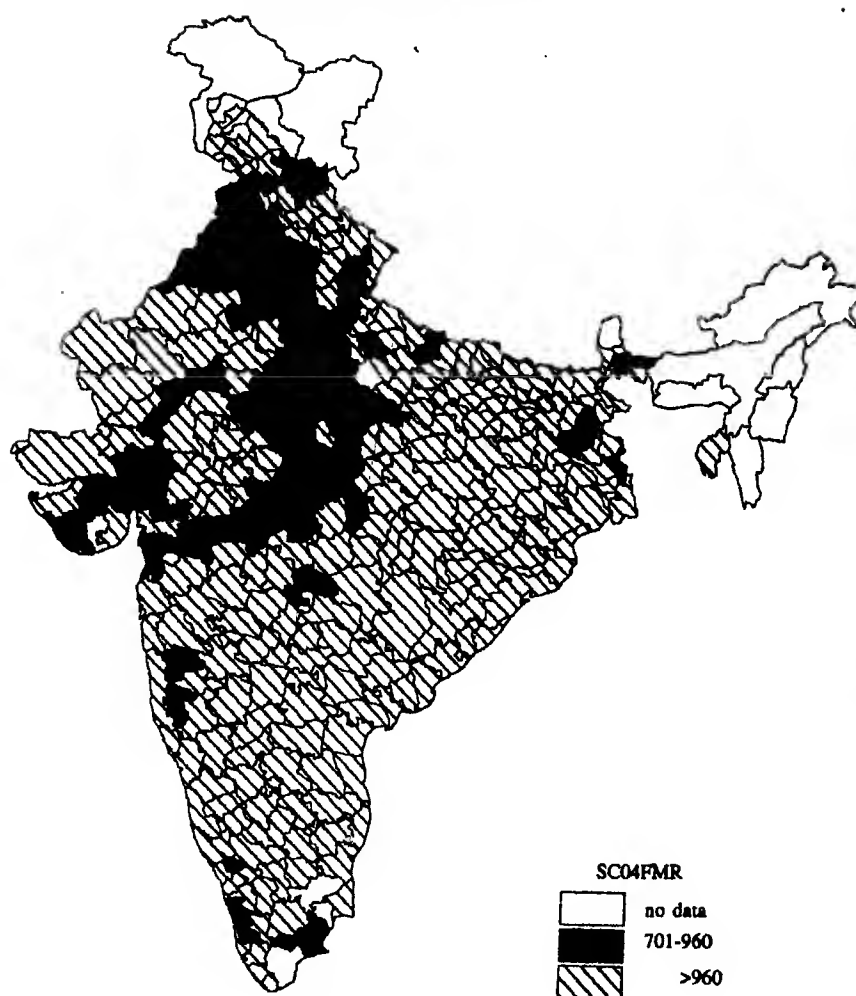

DIFFERENT MORTALITY PATTERNS

There is however, an important difference in the pattern of these deaths. During infancy, there is always an excess of infant male

TABLE 1: COMPARISON OF ALL AGE AND 0-9 AGE GROUP FMRs IN KERALA

FIGURE 2a: 0-4 FMRs FOR SC POPULATION

mortality. This is due to inherent vulnerability of the male infant compared to the female infant in a health neutral environment [see among others Miller 1989; Caldwell 1990; Mukherjee 1986; Government of India 1988b]. This physiological advantage of the female child gets reversed from the age of one onwards and by the age of 5 excess female mortality becomes the norm. It is marginal in some areas, significant in some others and substantial in yet others. District level estimates of the probability of death based on the 1981 Census data [Government of India 1988b] bear this out. The q1 and q2 tables, which indicate the probability of a child dying by the first and the second year respectively, indicate excess male mortality. At q3, i.e. by the age of three years, the survival chances for both the sexes are nearly balanced while at q5 level the girl children show a higher mortality.

The strong reversal of the mortality pattern after infancy in south Asia is well recognised and attributed to the differential care of the girl child or to put it more plainly to her access inequality to food, nutrition and care including health care compared to the male

child.¹⁴ This is essentially a socio-cultural process linked with the perceptions about the role of the sons and the daughters, and reflects the 'son preference',¹⁵ its extent and its operational consequences. As a matter of fact excess male mortality is never ascribed to any discrimination against the male

members of the household whereas excess female mortality is more often than not attributed to such a discrimination. To that extent one can term the excess male child mortality as natural and the excess female child mortality as socio-cultural. The former is driven by exposure to health risks and possibly the absence of effective health care, while the latter is driven by access inequalities described above.

Juvenile sex ratio aggregates both these mortality patterns. It is a combined ratio of 10 single year age cohorts. The first two cohorts among these will reflect the pattern of excess male mortality during infancy while the subsequent eight cohorts will reflect the reversal of this pattern to various degrees. If we were able to disaggregate the JFMRs into two age groups; the 0-2 age group and the 3-9 year age group, some significant differences could be anticipated between the two.

The FMR in the 0-2 age group (0-2FMR henceforth), would show preponderance of female children compared to those in the 3-9 age group (3-9FMRs). Further, as the excess male mortality during infancy is a biological phenomenon, it will be distributed randomly across different regions and there should not be any significant spatial variation.¹⁶

The 3-9FMRs on the other hand will reflect the effects of discrimination against the girl children driven by the socio-cultural practices. These practices vary from region to region in their extent and nature. As such the 3-9FMRs can be expected to display a less random regional distribution. We can in fact expect these FMRs to be significantly contiguous within different socio-cultural regions and significantly different across these regions.

Such differences will also be observed across different social groups, e.g. the tribals, the scheduled castes and the rest of the population which differ in terms of the position of women in their society. It will

FIGURE 2b: 04FMRs FOR NON-ST/SC POPULATION

be worthwhile to explore therefore, the differences in the FMR patterns between these two age groups; 0-2 and 3-9 years, across different regions and social groups.

Unfortunately, the suitable census data available for this purpose is the 5-year age group data at the district level. Even this break-up has become available separately for the first time for the tribals and the scheduled castes in the 1981 Census. As a result one can only use the 0-4 and 5-9 year age group data for working out the FMRs among these age groups.

We could nonetheless examine the sex ratio patterns among the 0-4 age group and the 5-9 age group. The differences in the 04FMRs and the 59FMRs may not be as sharp as those between the 02FMRs and the 39FMRs. Yet, valuable insights may be obtained through such an exploration. The 04FMRs would contain two additional single age group cohorts in addition to the three in the 02FMR. Both these will carry the effects of excess female mortality that sets in by the age of three years. As such the 04FMR values will be lower than those for the 0-2 age group and the randomness in the

spatial variation may also be less.¹⁷ But this 'blurring' may get compensated in the patterns that 59FMRs reveal. The five single year age group cohorts that contribute to the 59FMR will reflect the mortality pattern from the age of 5 and above; a stage where the pattern of excess female mortality has already 'stabilised'. As a result we may expect the 59FMRs to be significantly lower than the 04FMRs and to reflect the regional differences more sharply. We will see if this really happens.

Before analysing these differences in detail, we examine the district level maps of these FMRs for different social groups. These maps give a clear idea of the variations in the sex ratio patterns across different regions for the two age groups and the three social groups. Figures 2a and 2b show the 04FMRs for the SC and the non-ST/SC or the general population separately (in this paper the terms non-ST/SC, general and others will be used interchangeably). Figures 3a, 3b, 3c display the 59FMRs for the SC, general and the tribal population.

Setting aside the niceties of sequencing, we first examine the 59FMR map (3b) for

non-SC/ST population. Four broad FMR ranges which are more or less spatially contiguous can be noted. The region with lowest FMR range; below 900, spreads across the plains north of Narmada. It contains a 'hard' core area of alarmingly low FMRs; below 850; spanning 21 districts in Haryana, western UP, north eastern Rajasthan and the ravines of MP. The next range of FMRs between 900 and 950 covers most of the remaining districts in the plains in the north, districts of West Bengal, districts in the central regions and descends across Narmada into south through Jalgaon, Dhule and Nasik districts of Maharashtra. The gradual 'recovery' of the FMRs and the contiguous contours make the description of 'pit with sloping sides' very apt for the region with very low FMRs [Oldenberg 1992].

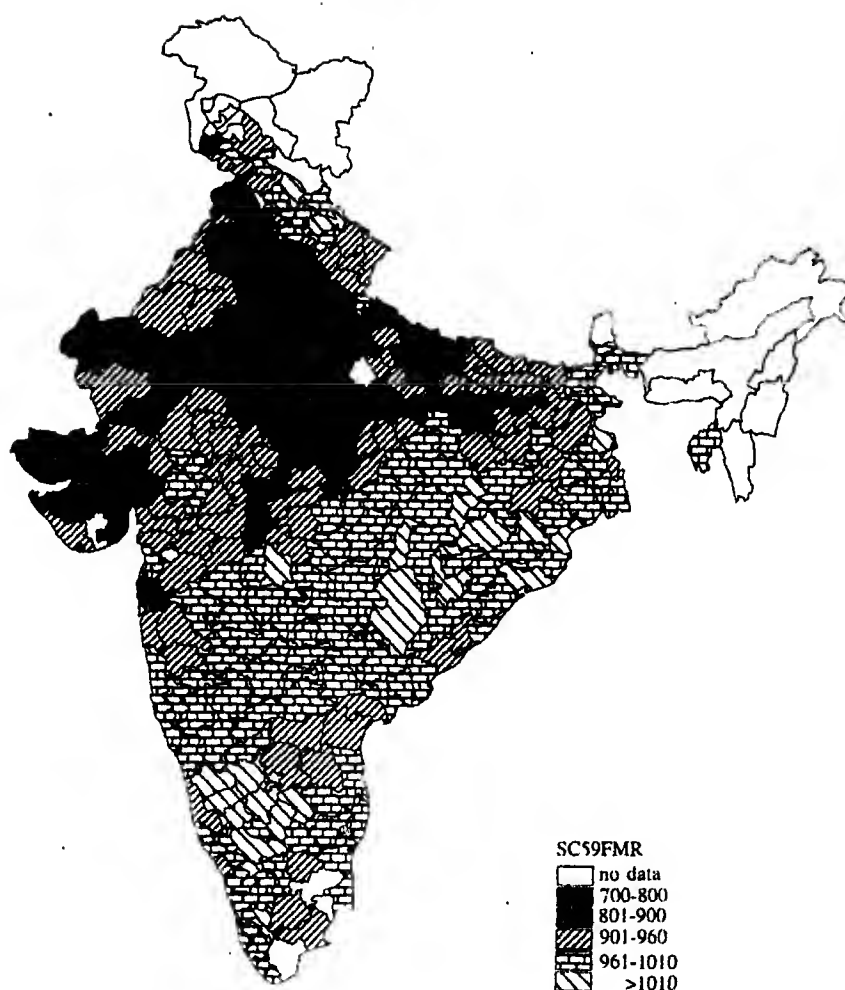

The remaining regions in the south-eastern states have 59FMRs above 950. The hilly state of Himachal Pradesh, Jammu and Kashmir and hill districts of UP also have FMRs above 950. There are some 52 districts in the south eastern region, in different contiguous patches where the 59FMRs are above 1000. One significant block covers Telangana region of Andhra, Chandrapur in Maharashtra, Chhattisgarh in MP and the tribal tract of Orissa. Most of these districts are known to be economically poor and backward.

The 59FMRs for scheduled caste population follow a similar pattern (Figure 3a), but the FMRs are disturbingly low in the northern region. There are 24 districts with 59FMRs below 800. This situation, to put it mildly, is scandalous. Oldenberg's (1992:2658) use of the term 'Bermuda triangle for the girl children' will be applicable for this region.

The range of 59FMRs below 900 for the SC population spreads over a larger area covering 107 districts, all confined to regions north of Narmada. The next FMR range of 900 to 950; in 79 districts, does make inroads in the Rayalseema region of Andhra and in Salem region of Tamil Nadu. Rest of the districts, 110 in number, mostly in south-east have FMR range between 950 and 1000. The contiguous patches of FMR above 1000 in 43 districts in the south eastern region more or less coincide with the districts where 59FMR for the general population are also high.

For tribal population the 59FMR rarely goes below 900 (Figure 3c) except in 11 districts of Rajasthan.¹⁸ The next set of about 45 districts in the FMR range of 900 to 950, lie mainly in the plain regions of Rajasthan and northern MP. Another contiguous cluster covers the Rayalseema region of Andhra and its adjoining regions in Tamil Nadu. Most other districts; 133 in numbers, have FMRs above 950 with a sizeable number; 45 among

FIGURE 3a: 59FMRs (SC)

them, having FMRs above 1000. Most of the districts of north-eastern states have FMRs in range of 950 to 1000. We have, however, not included these in our analysis as indicated earlier.

The 04FMRs for the scheduled caste population (Figure 2a) reveal a contiguous patch of about 80 districts with 04FMR values below 950. There are only 12 districts where the 04FMRs go below 900. In rest of the districts the 04FMRs are above 950; in 96 of them 04FMRs exceed 1000. The contiguous patch of low FMRs is confined to the north-western belt. It starts from the plains of Punjab and Haryana, and through plains of western UP and ravines of Madhya Pradesh descends down to East Nimar and West Nimar districts of Madhya Pradesh. Another patch starts with Ajmer in Rajasthan and descends down the Pali, Sirohi route to the plains of Gujarat down to Vadodara. But for Nagaur and Sikar districts it could have joined the Haryana region in a contiguous chain.

The pattern of 04FMRs for the non-ST/SC population (Figure 2b) is similar but more intriguing. The number of districts

with FMR below 900 is only 8, and those with 59FMRs below 950 is 85. These form a contiguous tract which again descends down the plains of Punjab, Haryana and western UP, to Hoshangabad and Betul districts of MP. But it makes further ingress into the south across Khandesh region of Maharashtra, into its western ghat region and goes as far as inland Karnataka. (Permitting a minor liberty taken with FMR in East Nimar (969) and Bijapur (965) districts.) The belt joins up with the Sirohi, Vadodara belt through Khandesh region of Maharashtra and, except a break in Ajmer district, joins the Haryana plains through the Pali, Nagaur and Sikar.

There are other stray cases of districts with low 04FMR. Two of these deserve attention: Lahaul and Spiti and Kinnaur in Himachal Pradesh and Salem in Tamil Nadu. Lahaul and Spiti and Kinnaur districts stand out for their low FMR values for both the 0-4 and 5-9 age groups. Being situated in a zone with otherwise favourable sex ratios these present an anomaly that needs to be investigated.

Salem district has already been in focus for the practice of sex selective infanticide

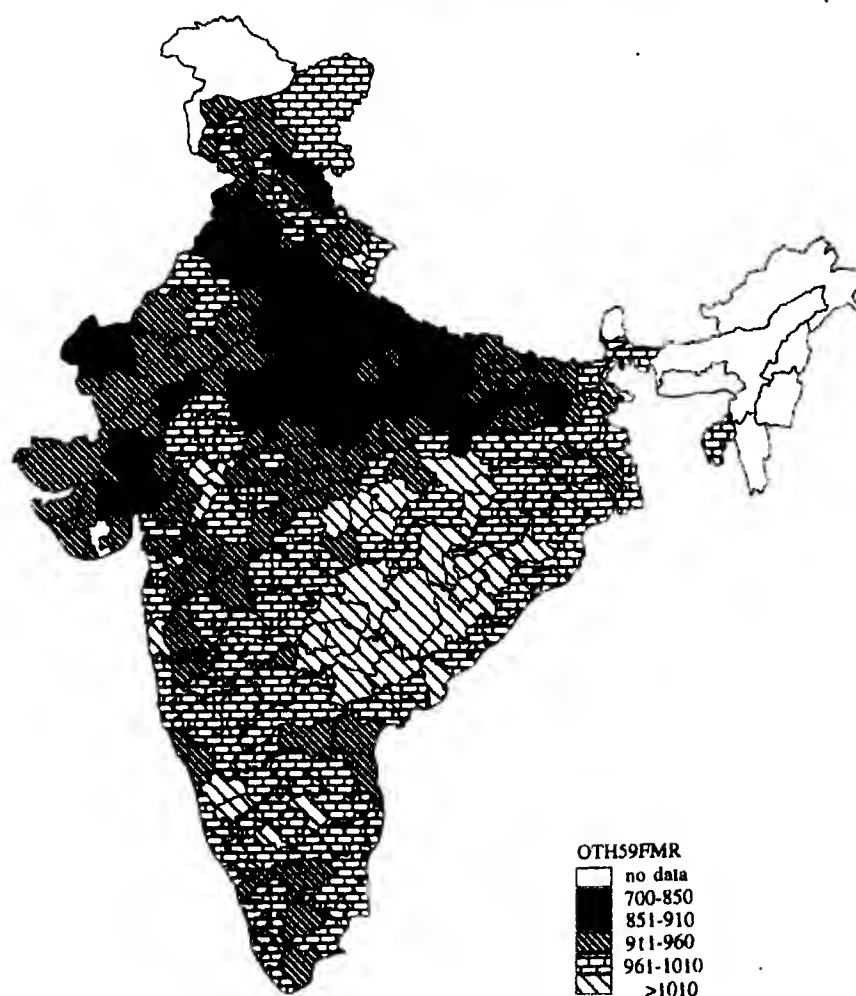

[George et al 1992:1153-57]. Such practice in large numbers will automatically show up in low 04FMRs and this is precisely the case with Salem. It is the only district in south where 04FMR value goes below 900 (876 for the non-ST/SC). It is pertinent to suggest that a focused search for extremely low values of 04FMRs among different regions and groups at block levels (for which 1991 Census data is available), may be a very useful method of detecting areas where sex selective infanticide or foeticide may have assumed serious proportions.

Low 04FMRs are in any case indicative of the regions where the excess female child mortality has made ingress into early years of childhood. As such these indicate intensification of anti-female bias. In view of the concerns expressed by Miller (1989) and others about the ingress of northern sex ratio patterns into the south, the route of low 04FMRs described above assumes significance. If such ingress is taking place it is most likely to take place along the route of cultural circulation between the north and south. The low 04FMR route appears to coincide more or less with this route of cultural circulation.¹⁴ This aspect needs attention from a combined perspective of cultural geography, gender and demography. This issue is intended to be pursued in further details once the five year age group break-up for different social groups in the 1991 Census becomes available.

Among the tribals, 04FMRs rarely go below 950 (8 districts) and are above 1000 in majority of districts (about 116). In 16 districts out of these the 04FMR exceeds 1050. There are no particular spatial patterns. As such a district level map is not presented here.

We thus find that the disaggregation of the juvenile age group FMRs into 59FMR and the 04FMR is a useful one and these FMRs have significantly different patterns. We can therefore proceed to examine in some detail, the differences between these FMRs for different regions and different social groups. We first analyse the differences between the 09FMRs, 59FMRs and 04FMRs for different groups and examine the hypothesis that the 04FMRs will be significantly higher than the 59FMRs. This indeed happens to be the case. Table 3.1 provides the data for the overall population, as well as its three segments the tribal, the scheduled caste and the rest. For all these groups the 04FMRs are significantly higher and 59FMRs significantly lower. The gap between 04FMRs and 59FMRs is pronounced for the SC population and becomes even more so if we take the 94 districts where the SC population accounts for above 20 per cent of the district population. This gap is less pronounced for the tribal and tends to narrow down as we go to the 50 districts which have 20 per cent or more tribal population.

FIGURE 3b: 5-9F AGE-GROUP FMR NON-SC/ST (1981)

We next examine the differences in the 59FMRs across different social groups (Table 3.2). This is done for the 355 districts as well as for districts with different concentration of scheduled caste and scheduled tribe population. The 59FMRs for the overall population, the non-tribal population and the non-ST/SC population do not differ significantly from each other. But the 59FMRs for the SC population (339 districts) and the tribal population (189 districts) differ from these significantly. The difference between the 59FMRs for the SC and the non-ST/SC population remains significant when we take sub-samples of districts with increasing concentration of the SC population. The 59FMRs for the non-ST/SC and the tribal population also differ significantly in these sub-samples and so do the 59FMRs among the tribal and the scheduled castes. FMRs for tribals are high, FMRs for the scheduled castes are low while those for the non-ST/SC population occupy an intermediate position.

When we group the districts by the percentage of tribal population, the difference between the tribal and the non-ST/SC

population FMRs becomes insignificant while the 59FMRs for the SC population remains significantly different and low. The difference narrows down considerably in the 50 districts where tribal population is above 20 per cent of the district population.

When we compare the 04FMRs between the three social groups (Table 3.3) we find that these do not differ significantly among the SC and the non-ST/SC groups. 04FMRs for the tribal population are, however, significantly higher in all the groups of districts and have a mean value above 1000. As the percentage of tribal population goes from 1 per cent to 20 per cent, these FMRs show an increasing trend for all the three groups. But when the SC population percentage increases similarly, the 04FMRs for the SC and the non-ST/SC group shows a declining trend. The 04FMRs for the tribal population remain unaffected.

We thus see a clear difference between the two 'layers' within the juvenile age group FMRs: the 04FMRs and the 59FMRs. The 04FMRs are significantly higher than the 59FMRs for the three social groups and different sub-samples of districts. They are

more evenly spread across different regions and do not differ significantly within the non-tribal population, i.e., between the SC and the non-ST/SC group. The 04FMRs for the tribals are different and have quite high values, typically above 1000.

The 59FMRs on the other hand, assume much lower values, differ between the three social groups significantly across different sub-samples of the districts. They show a remarkable contiguity across different regions and vary over a much larger range than the 04FMRs are. In certain regions they have alarmingly low values.

The relatively even range of the 04FMRs compared to the 59FMRs can be seen through an analysis of variance in the two FMRs over same set of districts and social groups (Table 4). The variance or the standard deviation in the 04FMR values is considerably lower than that for the 59FMR values. The pattern persists in the sub-sample of districts where the SC or the ST population percentage exceeds 20 per cent.

Thus we find that 59FMR satisfactorily captures the socio-cultural patterns of excess female mortality in the juvenile group. Lower 59FMRs indicate adverse survival conditions faced by the girl children compared to the male children while higher 59FMRs indicate less discrimination between the two.

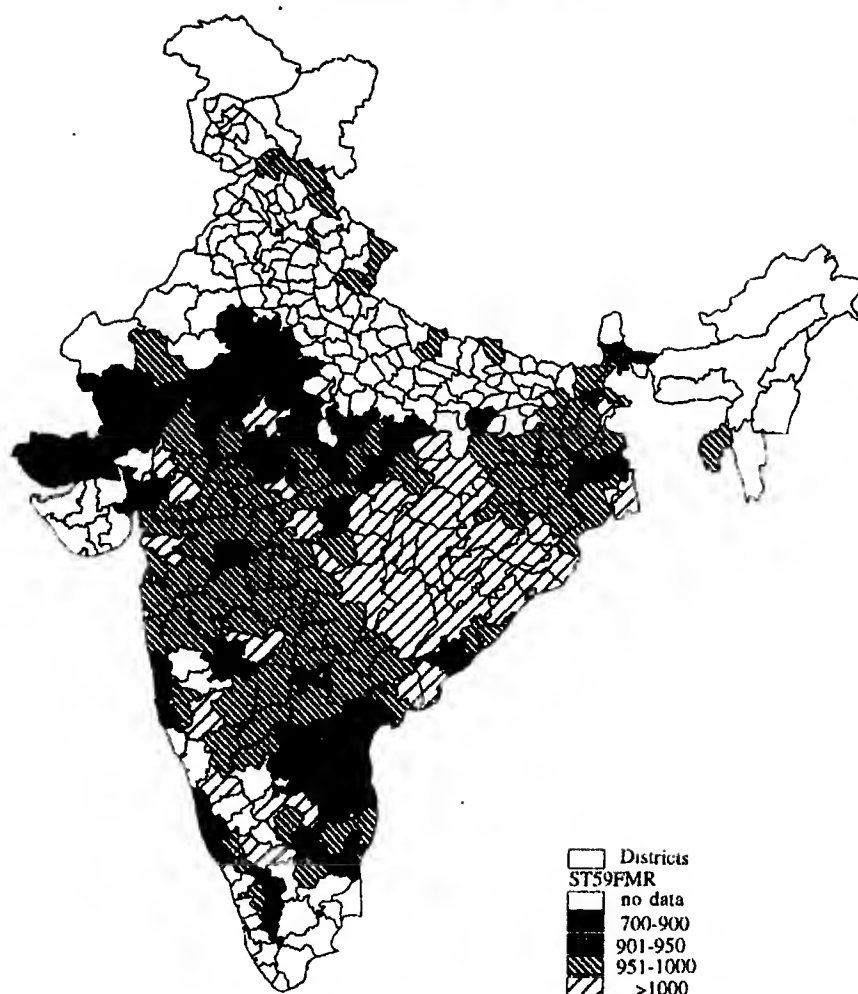

We can notice that the districts with low 04FMR also have low 59FMRs. They will rarely, if at all, have high 59FMRs. Districts with high 04FMRs, on the other hand, can have low 59FMRs; typically in the north-western region, or high 59FMRs; typically in the south eastern region.

We thus get four categories of districts: (a) those with low 04FMRs and low 59FMRs, (b) those with high 04FMRs but low 59FMRs, (c) those with high 04FMRs and high 59FMRs, and (d) those with low 04FMRs and high 59FMRs.

The first category covers districts where the pattern of excess female mortality gets established during infancy, or in extreme cases even before it through infanticide or sex selective abortions. The second category will be indicative of the districts where the excess female mortality sets in during later years of childhood. The third category of districts will be the ones where the discrimination against the girl child is not very strong. The last category will hardly be encountered anywhere as the pattern of excess female mortality that sets in early is unlikely to be reversed in later years of childhood.

One possible way of grouping different districts is the percentage of the scheduled caste or scheduled tribe population. This has been used in some of the recent analyses [Kishore 1993; Murthy 1995] and we have used it above. The concentration of the scheduled caste or the tribal population by itself may not, however, be a very useful indicator

FIGURE 3C: 59FMRs (TRIBAL POPULATION)

of the differences in the survival patterns by sex. The 59FMRs can, as we have seen above, be more useful indicators of such differences and so can the 04FMRs; at least at the lower end of the range. It will be relevant therefore to examine the differences in FMR patterns by different FMR ranges.

This analysis is presented in Table 5. We examine the 04FMR and 59FMR patterns for different sub-samples of districts grouped according to different 59FMR ranges. Four ranges of 59FMRs are chosen: (i) below 900, (ii) between 900 and 950, (iii) between 950 and 1,000, and (iv) above 1,000. For SC 59FMRs an additional range of very low FMRs (below 800) is also considered.

We analyse both 04FMRs and 59FMRs in these ranges for the three social groups. We also look at the drop from the mean 04FMR to the mean 59FMR for the given set of districts. The extent of this drop indicates the survival adversity faced by the girl children. We find out how the three social groups fare within different sub-samples relative to each other.

There are 24 districts with 59FMR for SC population below 800. The 04FMRs in these

districts are low (mean 901) as well. The non-ST/SC population fares relatively better (mean 04FMR 940), but only relatively. Clearly, the adversities in survival impinge upon the girl children among the scheduled castes more sharply. The drop from the mean 04FMR to the mean 59FMR is 138 points for the scheduled castes and 92 points for the others. There are only three districts in this group with significant tribal population, viz, Bharatpur and Sawai Madhopur of Rajasthan and Morena of MP.

In the 107 districts where 59FMRs for the SC population are below 900, the pattern of adverse survival for the girl children of the scheduled castes persists. While the 04FMRs for the SC population are higher compared to the previous group of 24 districts and are comparable to those for the general category, the 59FMRs remain significantly lower. The drop between mean 04FMR and mean 59FMR is 105 points for the scheduled caste population compared to a drop of 64 points for the general category. The 04FMR for the tribal population in 30 districts are high (mean of 993) but the drop from 04FMRs to 59FMRs (mean of 925) is quite large.

Even though the 59FMR for tribal in these districts are higher compared to those for non tribal, these are not high in terms of the FMRs for the tribal population.²⁰

In the next range of 59FMRs between 900 and 950, one finds that the 04FMRs improve sharply for both the SC and the general categories. The 04FMRs for the tribal remain significantly higher, though the gap between these and the 04FMRs for the non-tribal groups is quite narrow now. But the 59FMRs for the SC population remain significantly low while those for the tribal population improve considerably. The 59FMRs for the general category occupy intermediate position.

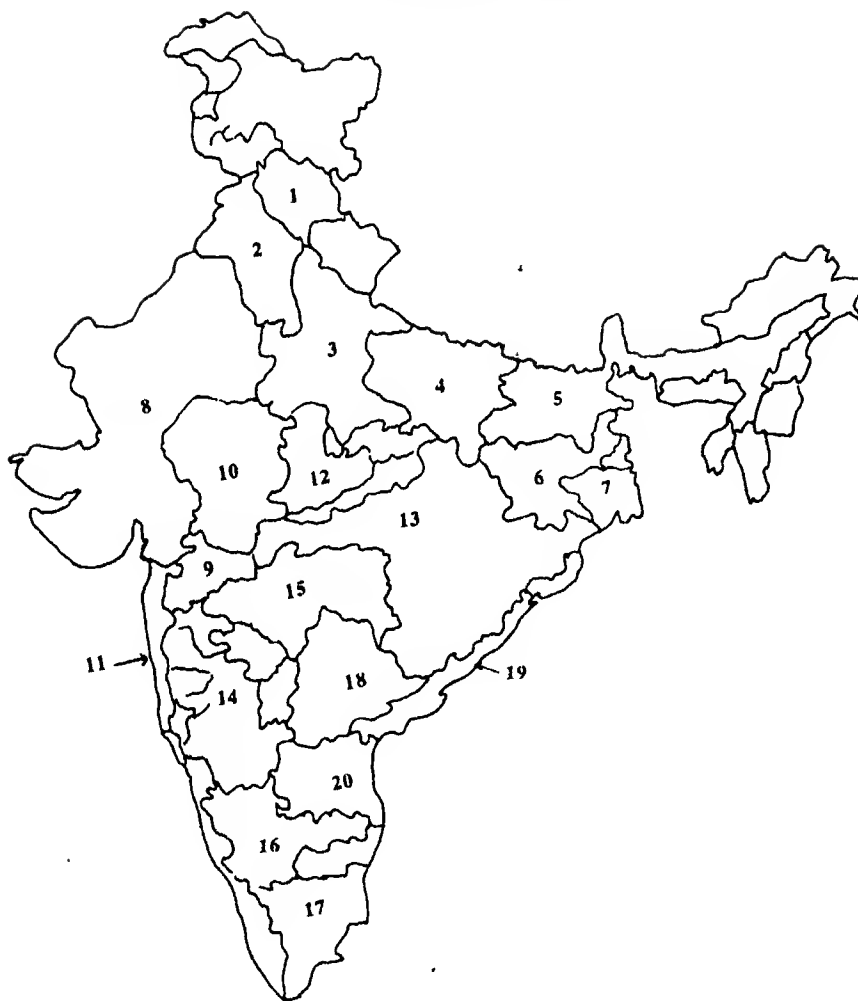

As the 59FMR for SC population rises above 950, the 04FMRs for the SC and ST population converge and become significantly higher than those for non-ST/SC groups. This is seen more sharply in the next range where the 59FMRs for the SC population exceed 1,000 in 43 districts. The difference in the 59FMRs for the three groups is insignificant.

We now examine the sub-sample of 189 districts with tribal population above 1 per cent. Slightly different results are obtained at the low FMR end. In the 11 districts of Rajasthan with 59FMR for the tribal below 900, the 04FMRs are comparable for all the three groups and fall in the range of 955 to 970. But the drop to 59FMRs is sharp for both the tribal and the SC population. These are comparable and are lower than those for the general population. This pattern remains more or less the same for the 56 districts (mostly in Rajasthan and Madhya Pradesh) where the 59FMRs for the tribal population are below 950. The FMRs for the tribal population, in both 0-4 and 5-9 age group, become significantly higher than those for the SC population in the FMR range of 950 to 1,000 (88 districts), and higher than those for both SC and non-SC/ST group in the 1,000 plus range.

When we take the 21 districts where the 59FMRs for the non-ST/SC population are below 850, the 04FMRs for the SC and the general category are comparable (there are only six districts with significant tribal population). But the drop between mean 04FMR and mean 59FMR is far sharper for the SC population and their 59FMRs are still significantly lower, than those of the non-ST/SC population.

It thus appears that the scheduled castes are worse off at the lower end of the 59FMR range no matter what the selection criterion is, i.e., 59FMR for the SC, ST or the non-ST/SC group. Further, at this end, the girl children among tribal and the SC groups fare worse than those in the non-ST/SC population. The situation in the tribal pockets improves quite sharply but that does not happen for the scheduled castes. This may

FIGURE 4: REGIONAL CLUSTERS

have something to do with the pattern of 'assimilation' of these two groups in the 'mainstream' of the society – tribals have been relatively isolated from this 'mainstream' even where their population percentage is moderate [Raza and Ahmad 1990]. But we would not pursue this discussion here.

While the patterns observed at the lower FMR end provide certain insights into the differences, those observed at the higher end also raises certain questions. In almost all the cases where 59FMRs are above 1,000, two trends can be noticed; the 04FMRs are also very high and, more importantly, the drop from 04FMR to 59FMR is insignificant and even negative. This would indicate that the pattern of excess male mortality persists beyond infancy. While this may indicate an absence of discrimination against the girl children beyond the age of one year, there could be other more worrying possibilities. It could also mean higher health risks and poor health infrastructure resulting in unusually high male infant deaths. Continuation of the excess male child mortality beyond infancy may not be an

indicator of the girl children faring well but of the male children faring badly. The subsequent absence of discrimination against the girl child may also be indicative of the poverty in the region, i.e., the material wherewithals for such discrimination may themselves be absent. Both these possibilities should cause concern. It is not a mere coincidence that the districts with 59FMRs above 1,000 are by and large the poorer and backward districts. This point needs further investigation.

IV

We saw above that the sex ratio patterns, especially for the 59FMRs, vary considerably within the boundaries of a state. On the other hand, they show remarkable contiguity across certain groups of districts. Some of these clusters have been noted for discernible ecological or geophysical boundaries.²¹

The 1981 population census has demarcated different geophysical regions and subregions across the country [Government of India 1988; 1981 Census Atlas 192-28]. 1961 Census had laid considerable emphasis

on such a classification and had initiated a number of studies related to it [Bose 1994]. There have also been other classifications of regions, apart from the one done by the census. A comprehensive compilation of these has been done by Bose (1994). These regions considerably overlap. While regional studies have not been a new phenomenon in India, their application in the field of demography, at least sex ratio analysis, has not been very frequent.²²

We use the census classification here to identify 19 different contiguous regions within which the 59FMRs display homogeneity (Figure 4). We then examine the significance of such a classification in terms of analysis and policy implication. A list of these regions and corresponding census regions and subregions is given in Appendix 1. Departure from the census scheme, when done, is indicated separately. Table 7 gives the mean of the 04FMRs and 59FMRs values of the districts in these regions.

The first region consists of the state of Himachal Pradesh, Jammu and Kashmir and the hilly region of UP, representing the 'south' within the north. Mean 59FMR for the 32 out of 34 districts in this region is 961 (barring the districts of L and S and Kinnaur which merit separate scrutiny for their low FMRs). FMRs for the scheduled castes are comparable (mean 957). This region, largely above 300 metres from the sea level, marks an important ecological boundary between the northern mountains and the plains in northern India.

Adjoining this region are the plains of Punjab and Haryana marked by highly masculine sex ratios; the mean 59FMR being 887 for the non-ST/SC population and 842 for the scheduled caste population. There is no tribal population in this belt.

But region 3 is the more alarming region, the 'pit'. It comprises of the upper Ganga plain of western UP, the three districts of Alwar, Bharatpur and Sawai Madhopur of Rajasthan, the ravines of Chambal in MP and the Zhansi uplands of UP. These 32 districts have a mean 59FMR of 850 for the non-ST/SC population and 797 for the scheduled caste population.

Low FMRs in these two regions, given that these are relatively prosperous regions of India, should be a matter of concern in both policy and academic realm. This also warrants a special coverage of at least some of the districts in this region during the 2001 Census to set at rest some of the optimistic speculation that underenumeration of females may be the cause of low FMRs in India.

The 23 districts of the middle Ganga plain represent the eastern side of the sloping region around the 'pit' with mean 59FMR for the non-ST/SC group being 892 and those for the SC population being 883. The

FMRs continue to look up along the lower Ganga plain of north and south Bihar (region 5 with mean 59FMR for the 22 districts being 920 for non-ST/SC and 908 for the SC population). In fact Purnia and Katihar districts of Bihar show a closer pattern to the lower Gangetic plain districts of West Bengal and have been grouped with these as such. These districts have high and comparable 59FMRs for all the three groups and a sizeable presence of tribal population.

The southern Bihar hills and plateaus mark an ecological transition from plains to hills and also mark one end of the north-south divide. These seven districts with sizeable tribal population have high 59FMRs for the tribals and others and relatively lower 59FMRs (mean 956) for the SC population.

The semi arid plains of Rajasthan and Gujarat, the Kachchh and Kathiwar peninsula and some areas of semi arid Rajasthan, form a block of 34 districts. These adjoin the low FMR regions 2 and 3 on one side and the central belt dividing the north and the south on the other. The 59FMRs for the non-ST/SC population are marginally better (mean of 920) but continues to be low for the SC population (mean of 886). The 59FMRs for the tribal population in 21 of its districts are low by the standards of tribal population (mean of 937). As a matter of fact there is a low FMR track starting from Ajmer in Rajasthan descending down through Pali and Sirohi districts to the Mehasana, Ahmedabad, Bhavnagar route in Gujarat. This track is flanked by relatively higher FMR regions on its western side and regions of high FMRs on its south-eastern side. But we have not separated this region on the basis of FMRs as this track cuts across different geophysical regions.

The districts of Udaipur, Chittaurgarh, Dungarpur, Banswara and Bhilwara in the relatively difficult terrain of the Aravali range of Rajasthan form a contiguous block with districts of Malwa plateau in MP extending to the three districts of Narmada Valley, viz, Jabalpur, Narsimhpur and Hoshangabad through West Nimar in the Satpura hills. It has high FMRs for the non-ST/SC and the tribal population but low FMRs still for the scheduled castes.

The other remaining region north of Narmada covers the northern uplands of MP, the Sagar and Bhopal plateau and through East Nimar, descends into the Khandesh region of Maharashtra and the Nasik Basin. It has mean 59FMR values of 925 for the non-ST/SC, 886 for the SC, and 955 for the tribal population.

The transition to high FMR zones begins with the central and eastern Satpura hill range of MP, the Baghelkhand plateau, the Chhattisgarh region Dandakaranya and Orissa highlands. This block of 23 districts also lies on the central tribal belt and joins

up with the south Bihar hills and plateau region. The mean 59FMRs here are 1,000 or above for all three social groups. South of the dividing belt, we have the west coast

region spreading from Valsad in Gujarat (Dang included), to Kerala through Maharashtra Konkan, Goa and Karnataka Konkan. It has high FMRs for all three groups.

On the inland side of this coastal belt, we have the western ghats of Maharashtra, north Karnataka plateau and the central Maidan forming one block of 13 districts and the Vidarbha, Marathwada and Mahakoshal region if Maharashtra forming another contiguous block of 13 districts with high FMRs for all three groups (mean 59FMR typically in the 975 to 990 range). 17 districts of Tamil Nadu follow similar 59FMR pattern, except that the tribal 59FMRs are low.

There are two contiguous blocks of very high 59FMR (mean 59FMR above 1,000) which need attention. One block covers 11 districts of the central south and the southern Karnataka plateau and Chittoor district of Andhra. The other block covers 10 districts of Telangana region in Andhra Pradesh. This block adjoins the Dandakaranya region and the Chandrapur, Bastar, Koraput tribal belt known for its backwardness. The eastern coastal region of Andhra including the district of Ganjam in Orissa also has uniformly high FMRs for the three groups.

A group of five districts in Rayalseema region of Andhra stands out for its low FMRs by southern standards (mean 59FMRs of 961 for non-ST/SC, 936 for the SC, and 931 for the tribal population). This covers the districts of Prakasam, Nellore, Cudappah, Anantpur and Kurnool.

We now examine, through analysis of variance if these 19 regions provide a more homogeneous grouping compared to the 20 states involved. The within group variance would be significantly less if a given grouping is more homogeneous. The F-ratios would as a result be higher. Table 6 indicates the within group variance and the total variance for both 04FMRs and the 59FMRs by region and state for the three social groups separately. Corresponding F-ratios are also indicated.

The regions provide much more homogeneous grouping than the states do for the 59FMRs for the general and the scheduled caste population. In the case of grouping by states, the within group variance accounts for nearly half of the total variance whereas if we group by regions it reduces to less than one-fourth of the total variance. The corresponding jump in the F-ratios is also significant. (It is possible to further 'fine tune' the regional grouping taking other factors into account and improve the F-ratios further. Such an exercise of cluster formation with minimum internal variance is not within the scope of present paper. We only intended to demonstrate that these regions, comparable in number to the number of states involved, achieve substantial reduction in the variance within the groups.)

While the grouping by regions appears much appropriate for the spatial analysis for the not tribal population segments, such is not the case with the tribal population. A study of the regionalisation of the tribal sex

ratios, however, is outside the scope of this paper.

Such change is also not significant for the 0-4 age group FMRs (Table 6). Although regions provide a more homogeneous grouping, the improvement in F-values is small and not as sharp as in the case of 5-9FMRs. This should not be surprising in view of the random spatial spread of the 04FMRs notwithstanding regions with low 04FMRs. It will be instructive to compare the situation with the one revealed by 1991 Census data.

V

What do the patterns above signify? Four pertinent points emerge. First, the sex ratio analysis has to move away from the state level and take into account the regional diversities. Even at the regional or the district level the differences in the patterns for the tribal, the scheduled caste and the rest of the population have to be taken into consideration. For these analyses, the JSRs or the JFMRs will be more appropriate variables compared to the all age group sex

ratios. But even this has to be disaggregated into the 0-4 and 5-9 age group FMRs because of the different mortality patterns in the 0-1 and 1-9 age group.

The regionalisation of the 59FMRs has important implications for the analysis of the correlates of sex ratio variations. It has of late been recognised that both cultural and economic factors affect female survival together [Kishore 1993; Murthy 1995]. It is quite likely that the regional patterns will throw a better light on the role of cultural variables. Even the economic factors like female labour participation would show considerable variation among different regions and social groups. The ravines of Madhya Pradesh, for example, will have a very different pattern of female labour participation than, say, Chhattisgarh region.

The reversal of mortality patterns within the 0-9 age group and differences in the 0-4 and 5-9 age group FMR patterns among the three social groups raise two important methodological points. One relates to the use of under-5 mortality as a composite variable. The other relates to the use of the population percentage of the SC or the tribal population.

The use of under-5 mortality as a composite variable may mask some of the differences in mortality patterns in the 0-1 and 1-5 age group. Three factors, infant mortality in absolute terms, excess male infant mortality and the excess female mortality beyond the age of 1 could combine differently to give an overall figure for the under-5 mortality. Further, these three factors may themselves differ for different social segments within a given region resulting in differences in the FMRs. And why just FMRs, even some of the correlates of the FMRs, economic as well as cultural, would differ among these three groups, within the same region and their effects may not linearly add up. We have already seen that FMR ranges reveal some of the differences among these groups more sharply than population percentages for the SC or the ST population. It will be prudent, therefore, to analyse the patterns separately for these three groups rather than linearly aggregating these and using the population percentage as a surrogate for effects which may be complex. Use of 0-4 and 5-9 age group sex ratio may provide better insights into the survival patterns by sex.

An important aspect for investigation in this context is the spread of the low FMR pattern. Whether the low 59FMR band has spread farther between, say, 1961 and 1991 will have important policy implications. Similarly, the trends in low 04FMRs will help identify regions where the survival conditions for the girl children are becoming more adverse. These trends may be of particular concern for specific social groups in specific regions, e.g. scheduled castes in region 3 above or the tribal population in Rajasthan. The five-year age group data from the 1991 Census and the regional level NFHS data will throw valuable light on these trends.

It is also clear that the design of women and child welfare policies has to take note of these differences. The nature of interventions for the scheduled caste population in western UP will be altogether different from those for tribal population in, say, southern Orissa. Such plurality will have to be built into the design stage. The low FMRs in 5-9 age group in the northern region put a big question mark on the effectiveness of the present interventions. Not only their nature needs a change, some of these low FMR districts may even have to be denied other developmental assistance until they achieve an acceptable level of FMRs. Until then a bulk of their rural development fund may be restricted to child welfare programmes. Likewise, the poorer districts with very high 04FMRs and equally high 59FMRs may require serious scrutiny in terms of health environment and the availability and level of health infrastructure. At the same time, districts which have fared well in terms of both 04FMRs and 59FMRs

may have to be given suitable incentives. Such provisions can be built into the planning process itself.

Appendix - I

REGIONS WITH HOMOGENEOUS SEX RATIO PATTERNS

- Region 1:** All districts of Himachal Pradesh, Jammu and Kashmir and hilly districts of UP, viz, Chamoli, Pithoragarh, Uttarkashi, Dehradun, Garhwal, Tehri Garhwal, Almora and Nainital. These form part of the Northern Himalayas.
- Region 2:** Part of the 'Great Plains'; All districts of Punjab and Haryana. (Although couple of districts in Haryana could go in the region 3)
- Region 3:** Districts of western UP in the upper Ganga plain; Saharanpur, Muzaffarnagar, Bijnor, Meerut, Ghaziabad, Bulandshahar, Moradabad, Rampur, Budaun, Bareilly, Pilibhit, Shahjahanpur, Aligarh, Mathura, Agra, Etah, Mainpuri, Farrukhabad, Etawah, Jalaun, Jhansi, Lalitpur, Hamirpur, Banda and Kheri, Bharatpur and Sawai Madhopur which constitute the subregion of Banas Chambal basin and Alwar (Alwar defies the subregional classification; it has been included here although it belongs to the subregion of Aravalli range and associated uplands of Semi-arid Rajasthan).
- Region 4:** Middle Ganga plain; Remaining districts of UP
- Region 5:** Districts of Bihar in lower Ganga plain; All districts of Bihar, except Katihar and Purnia clubbed with region 7 and the districts in region 6.
- Region 6:** South Bihar Hills and plateau; Districts of Palamau, Ranchi, Hazaribagh, Singhbhum, Dhanbad, Santhal Parganas.
- Region 7:** Katihar and Purnia of Bihar, all districts of West Bengal and Cuttack, Puri and Balasore districts of Orissa. (Although Purulia could be clubbed with region 6, and the hilly districts could form a separate group.)
- Region 8:** Semi-arid Rajasthan and plains of Gujrat; All districts of Rajasthan except those in region 10 (hilly region) and all districts of Gujarat except Valsad and Dang clubbed in region 11 covering districts on west coast.
- Region 10:** Hilly districts of Rajasthan [Bose, 1994:45], viz, Bhilwara, Udaipur,

Chittaurgarh, Dungarpur, Banswara and Jhalawar.

Malwa plateau and Narmada valley [Bose, 1994:46] in MP; the districts of Mandsaur, Ratlam, Ujjain, Shajapur, Dewas, Jhabua, Dhar, Indore, West Nimar, Rajgarh, Hoshangabad, Jabalpur, Narsimhapur

(West and East Nimar show a sharp divide which may be worth analysing at the block level).

Region 11: Western coastal districts; Starting from districts of Valsad and Dang at its northern end, going down through Thane, Raigarh and Ratnagiri in Maharashtra, Goa, Uttar and Dakshin Kannada in Karnataka to all districts of Kerala.

Region 12: North Malwa uplands i.e. Guna and Shivpuri; north central MP, i.e. Chhatrapur, Tikamgarh, Vindhya range and Rewa plateau Vidisha, Raisen, Sagar, Damoh, Bhopal, Panna, Rewa, Satna, East Nimar and; Jalgaon, Dhule and Nasik districts of Maharashtra. (This grouping draws upon the 1961 regions Bose (1994).)

Region 13: Remaining districts of MP covering Satpuras, Bagherkhand,

Chhattisgarh, Bastar and all districts of Orissa except three coastal districts (region 7) and Ganjam clubbed with region 19.

Region 14: Western Ghats in Maharashtra; Ahmednagar, Pune, Satara, Sangli, Solapur and Kolhapur; Inland Karnataka, ie, Belgaum and Dharwar; North Maidan, ie, Bidar, Gulbarga and Bijapur and Central Maidan, ie, Bellary and Raichur [Bose 1994: 47; 1961 Census classification]

Region 15: Marathwada, Vidarbha and Mahakosal regions of Maharashtra covering rest of its districts

Region 16: Rest of the districts of Karnataka covering South Maidan and Malnad and Chittoor of Andhra which shows different characteristics from Rayalseema where it is included in the census classification.

Region 17: Eastern Coastal region I; all districts of Tamil Nadu and Pondichery

Region 18: Telangana region of Andhra; Mahboobnagar, Rangareddy, Hyderabad, Medak, Nizamabad, Adilabad, Karimnagar, Warangal, Khammam and Nalgonda

TABLE 6: ANALYSIS OF FMRs BY REGIONS AND BY STATES

Variable	Region (DF = 18)				State (DF + 19)

(F Probability in all the cases is 0.0000)

TABLE 7: MEAN FMR VALUES IN DIFFERENT GEOPHYSICAL REGIONS

Region No	04FMRs			59FMRs		
	ST	SC	Others	ST	SC	Others
1	1015	988	972	977	957	956
2	-	921	924	-	842	887
3	972	932	947	854	792	850
4	1028	992	979	996	882	892
5	1056	1012	993	949	908	920
6	1033	989	1022	989	956	972
7	1003	996	997	975	981	980
8	988	958	958	937	886	920
10	1009	988	1010	961	934	980
11	1001	974	975	964	975	979
12	1008	948	962	955	886	925
13	1030	1019	995	1017	1000	1019
14	989	978	952	977	982	972
15	998	980	975	992	983	982
16	1008	1004	984	1001	1016	1009
17	1004	991	971	945	981	973
18	1020	1013	1007	968	998	1014
19	1027	1001	995	979	971	993
20	987	996	980	931	937	961

Note: Mean values here are mean of the FMR value of the districts in the region and NOT the mean FMR values for the region.

Region 19: East coastal Andhra and south Orissa; Ganjam district of Orissa and rest of the districts of Andhra except those in region 20.

Region 20: Anantpur, Cudappah and Kurnool of Rayalseema and the two southern coastal districts of Prakasam and Nellore classified as a separate subregion.

Remarks: (1) Delhi, Chandigarh and Bombay not included in the regional analysis. (2) The central zone which represents the north-south transition is difficult to classify and indicates tracks which further cut across these regions. These could be analysed at a more detailed level with smaller regions.

Notes

[This work is part of my ongoing research on Sex-Ratio Imbalances in India at the Eshool of Development Studies University of East Anglia, Norwich, UK, NR4 7TJ.]

I wish to gratefully acknowledge the help and guidance of Richard Palmer-Jones in preparation of maps 2A to 3C. He and Cecile Jackson also gave useful comments and suggestions on the draft version of this paper. I have also benefited from discussions with Bina Agarwal, Ashish Bose, K S Natarajan and Ravi Verma.]

- 1 We use the term FMR defined as the number of females per thousand male population to avoid confusion in use of the term sex ratios. In India the term sex ratios is traditionally used to mean number of women per thousand male population, exactly opposite to the international convention.
- 2 While this was noted in the earlier literature [Bardhan 1974; Visaria 1971], this pattern was explicitly brought into focus by Sopher (1980), Miller (1981) and later by Dyson and Moore (1983) among others.
- 3 Dyson and Moore have also recognised the difficulty in placing the eastern region into the northern or southern stereotype. Caldwell (1990) in fact considers this 'dichotomy' as exaggerated. In a recent paper, the author has attempted to extend the two-fold; north-south, classification into a five-fold classification using the sex ratio data for different language groups in India [Agnihotri Forthcoming].
- 4 There have been occasional references to the generally high FMRs among the tribals. Dange (1972:282) has raised this point explicitly in the context of Madhya Pradesh but this has not been pursued further. Miller (1981:74) has in fact considered the classification of tribals, scheduled castes and the rest as too gross. It is only recently, [Agnihotri 1995; and Agnihotri Forthcoming] that the differences between the sex ratio patterns among these three social groups has been examined systematically on a all-India basis leading to the present analysis. The possibility of significant differences between the scheduled caste and the non-SC/ST population has also not been seriously explored so far.
- 5 The trend normally is to use the state level data. Valuable contributions have been made by Sopher (1980), Libby (1980), Miller (1981) and more recently Kishore (1993) and Murthy,

Guio and Dreze (1995) by using district level data, yet most of the analysis continues to draw upon state level figures not corrected for migration.

- 6 Vannemann and Barnes (1992) provide extremely useful data on various aspects at district level including the population Census data from 1961 to 1981. They too have not included the detailed data on the tribal and SC population in some respects. For these the special tables from 1981 Census have been used. This database tends to aggregate some of the data at the state level for the small states, particularly in the north-east.
- 7 Visaria (1971:26) has calculated the effect of random errors on the sex ratios for different sample sizes of live births. He indicates that one requires a surprisingly high number of births, 10,000 and above, to get the sex ratios at birth within a narrow confidence range.
- 8 Present analysis does not cover the tribal districts in the north-east. This may appear unusual, but in our opinion the tribal in the north-east and in central India belt differ considerably, a point intended to be dealt with elsewhere. Inclusion of these districts could have resulted in aggregation of non-comparable groups.
- 9 Oldenberg (1992:2658) has used this term although not on the basis of the juvenile sex ratios. We will later see that this is an apt description for a group of 24 districts with very low 59FMRs. This region resembles, to use Oldenberg's graphical term, a 'pit' with sloping sides when we look at the spatial distribution of the FMRs across districts.
- 10 Desai (1969:Ch 7 and pp 206-207); Srivastava (1979:58-59 and 71) for details based on 1961 and 1971 Census data.
- 11 See, for example, Kundu and Sahu (1991), who opine that "at the state or district level, migration, is the single most important factor explaining the temporal and cross-sectional variations in sex ratio". In our opinion, once the relative survival of the females is recognised as the central issue of analysis, the debate on migration becomes unnecessary if the sex ratios for the juvenile population are used.
- 12 We assume here that the sex ratio at birth is nearly constant across different regions; 104 to 109 male children per thousand female children. We also assume that enumeration errors are not significant enough. We do not rule out enumeration errors, but do not share the view that the low sex ratios can be explained away by sex selective underenumeration of female children. Visaria (1971) has adequately dealt with this issue but this view persists nevertheless. Also see Kishore (1993) and Murthy (1995).
- 13 (a) Government of India (1991).
(b) Deaths in 0-9 age group account for about one-fourth of the total deaths and little less than half of the deaths below the age of 60 (Government of India 1991).
- 14 See Harias (1987), Miller (1981, 1989), Basu (1989), Caldwell (1990), Mukherjee (1986), Bhatia (1983) (quoted in Caldwell (1990)). An elaborate discussion of this 'neglect' has been done in Miller (1981). There is some debate about the relative importance of different factors in survival, e.g., nutrition versus health care, etc. We do not intend going into it in this paper except observing that parity in one aspect does not necessarily mean parity in other aspects and the combined impact of different factors in terms of mortality will always be guided by the factor in which the gap is larger (and critical). There may be equality in consumption of calories, for example, but a critical gap in access to health care between two groups. The mortality differences will be driven by the latter and if the situation is reverse, then by the gap in calorie consumption.
- 15 See Kielmann (1983:185) quoted in Caldwell (1990:17).
- 16 This will not be the case where excess female child mortality is very sharp in the toddler (1-2) age group or has made inroads in the 0-1 age group or even prior to it through infanticide or sex selective abortions. Also see note 17.
- 17 This will particularly be the case in districts where excess female child mortality has become significant between the age of one and two years itself or even earlier as some recent data from the National Family Health Survey (NFHS, 1995: Table 8.5) shows. Caldwell (1990) have also discussed such possibility. Government of India (1988b) in fact, lists out 142 districts, (20 in Bihar, 9 in Gujarat, 12 in Haryana, 9 in Punjab, 14 each in Rajasthan and MP, 46 in UP being main contributors) where the q2 values for the girl children are high compared to those for the boys.
- 18 These districts are: Alwar, Bharatpur, Sawai Madhopur, Jhunjhunu, Sikar, Jaipur, Tonk, Bundi, Jalor and Barmer.
- 19 See Bharadwaj (1977: Ch II and V), Sopher (1980: Ch 10), Spate (1971, Ch 6) and Schwartzberg (1992: IIIA and related maps) on the point of cultural circulation between the north and the south across Narmada-Chhotanagpur belt.
- 20 It will be very interesting to see how the underenumeration optimists*, will like to explain away this pattern except by invoking an underenumeration in the 5-9 age group and its absence in the 0-4 age group. The sharp decline in the FMRs from 0-4 age group to 5-9 age group among the tribals is even more hard to explain away by invoking underenumeration. The tribals are far less likely to practice underreporting of the girl children given their social structure. (* Those who expect the relative underenumeration of the girl children to be the main cause of the low FMRs.)
- 21 Libby (1980:94) has noted, for example, the ecological distinction between eastern and western UP. Bardhan (1974) has also talked about the wheat and the rice divide in the sex ratios, arguing that the low female participation in wheat regions vis-a-vis high participation in rice regions affects the sex ratio patterns in these regions.
- 22 Even recent studies like Raju (1991) who has dealt with 'Gender and Deprivation - A Theme Revisited with Geographical Perspective' or Agarwal (1994: Ch 8, 316-419) while 'tracing cross-cultural diversities' in respect of women's position have confined their attention at state level. Murthy, Guio and Dreze (1995) are perhaps the first to take up regional classification systematically in the gender context.

Strategies for a Viable Transition

Lessons from the Political Economy of Renewal

Alice Amsden
Michael Intriligator
Robert McIntyre
Lance Taylor

The poor economic performance and the resulting political instability of the post-socialist countries have stemmed from copying the wrong capitalist model – voluntarily or otherwise. Until they learn from both their own past and the experience of successful late-industrialisers and piece together their own sensible policies, specifically geared to their current status, their efforts to restructure and to make a transition to a market economy will continue to sputter.

This report is a collaborative effort which represents an agreed upon core of analysis that differs sharply and systematically from both the received wisdom of the so-called 'Washington Consensus' and the economic policies of the Russian government in the period from 1990 to 1995. Our goal is to provide a point of departure for an innovative economic policy that can both lift the Russian economy out of its current depressed state and at the same time be socially and politically viable. Only a drastically different approach has any hope of allowing democratically and economically successful renewal to begin from among the ruins created by past policies.

ECONOMIC policy analysis and prescription for Russia during the transition been dominated by an Anglo-American folk-tale of development. This belief in the self-organising character of markets is partly naive, but is more fundamentally ideologically driven – it is a political tactic which ignores or supersedes economic logic and economic history, including Russian economic history.

While shock therapy is now discredited, the slower application of such 'shock methods' is little different – it is still an almost entirely destructive process which fails to set the foundations for positive growth. The result has been an awful disaster for Russia which does not lead to the creation of conditions which are able to support either short-run or long-run viable growth.

Successful renewal is still possible for Russia on the basis of very different economic policies. Fortunately the economic and political aspects of such a new direction reinforce each other, unlike the current chaos. It is vital to redirect economic policy in the light of the central fact of modern experience – that there is no successful economic transition without an active and coherent 'developmental' state. These lessons have been avoided by Russian resistance to learning from recent Asian experience, but they also ignore the fact that west European development after 1830 provided the pattern that Japan and other countries followed in their successful transitions. The appeal of speed and efficiency made in the name of reform-from-above-by-decree is by now an evident self-parody. If rapid, it is progress on the road to nowhere.

The crucial political requirement for economic success is the formulation of a set of transition policies that have broad public support. Unless such public assent is achieved and arrangements sensitive to public opinion are built into the process from the beginning no 'reforms' will be irreversible. Russia must make fundamentally 'constitutional' decisions that will set the boundaries for all future economic life and broadly shape all aspects of social and personal life.

Economic-political requirements for a successful transition will be much easier to achieve if policies are adopted which are more consistent with the existing social and personal values of the Russian population. A policy which reasserts the responsibility of the state to play a major guiding role in economic development and tolerates local retention of many elements of the old system of social protection would find wide popular support. It would be the basis for creation of a diverse, mixed system. As such it would be more like the modern mixed economies of France, Italy or Japan than the textbook models of the neo-liberal fantasy world.

NEO-LIBERAL IDEOLOGY, SHOCK THERAPY AND SHOCK TRANSITION

Russia has been inhibited from mobilising its energies for the transition by a dogged determination to continue a fixed set of economic policies. These discredited policies pay little attention to the shape, form, and substance of the existing economic institutions. They also ignore the realities of the constructive role of government intervention in the postwar rebuilding of Germany, Italy, Austria and Japan; the

economic transformation of South Korea and Taiwan; and the recent restructuring of China and Vietnam.

The transition policies that have been adopted in the former Soviet Union and eastern Europe have varied across countries, but they have been generally unsuited both to the already heavily industrialised status of the region and to the oligopolistic market structures of the global economy of the 1990s. In particular, 'shock therapy' has been excessively inflationary, has promoted production stagnation or collapse, and has had the further effect of de-industrialising large segments of the region while destroying the honest middle-class which is the backbone of the political and economic system.

These economic transition policies have been in part involuntary. They are partly a consequence of the conditions attached to the loans of the World Bank and the International Monetary Fund. In the 1980s these two institutions promoted an extreme form of neo-liberalism (the so-called 'Washington Consensus'), enforced by conditions imposed on the assistance they offered around the globe. The neo-liberalism that set the stage for the current primitive capitalist policies in the post-socialist countries was not grounded in new insights or fresh empirical evidence about economic transition.

Most of the theoretical work done in economics in these years weakened rather than strengthened the intellectual weight of the simple free-market paradigm, including systematic efforts to take account of the implications of imperfect information, the rise of the 'New Growth Economics' and the 'New Trade Theories'. Yet, for political

reasons, a virulent form of neo-liberalism spread from Washington throughout the world, virtually without resistance after the collapse of the opposite extreme, central planning.

Despite dire results, the persistent reliance on the logic of shock therapy/shock transition in Russia and eastern Europe has been partly voluntary, reflecting the opinions of part of the intelligentsia. It became an article of faith for many intellectuals that rapid, radical economic reform was imperative to avoid a reversal of course at the next elections. Economists in the former Soviet Union and eastern Europe were pressured to commit themselves to radical reform or gain a reputation for being 'crypto-Stalinists'.

The application of 'market Stalinist' policies produced a disaster in which the pain does not lead to the creation of conditions able to support either short-run or long-run viable growth patterns. Many of the policies pursued have a 'path dependent' aspect where outcomes cannot be undone or initial conditions cannot be restored once certain links are broken. The political-tactical desire to destroy something led to the immediate destruction of much more and greatly limited future options.

In practice, extremist economic policies have bred extremist political responses, thereby undermining the entire reform effort. Even radical reforms have proved reversible. Instead of openly and systematically restructuring only the best state-owned enterprises (SOEs), governments everywhere have been forced to continue subsidising these enterprises in order to prevent their economic collapse. Instead of nurturing financial systems that successfully 'intermediate' savings and investment flows among households, the public sector, and productive enterprises, the authorities have sanctioned unregulated financial speculation and pyramid schemes such as MMM whose crash destroyed the wealth of millions of shareholders and contributed nothing to capital formation.

INITIAL CONDITIONS IN RUSSIA DID NOT REQUIRE FAILURE

Economic transition policies have failed because of this mixture of fear and ignorance. Fear of a return to the old system has led to emphasis on speed for purely political reasons. In order to not allow time for the opposition to realise what is happening and organise resistance, public discussion of key rules has been avoided. This tactical emphasis on speed has led to incompetent policies and caused massive damage. In addition, ignorance of the rules of behaviour of successful government in modern market-oriented states has supported a simple-minded adoption of neo-liberal ideology. This

ideological formulation is entirely lacking in substance as a guide to real policy choices under real Russian conditions. We hope to encourage recognition of the necessity of restructuring the state itself in the former Socialist countries in order to introduce the market institutions that are essential for long-term capital accumulation and employment growth. Such measures are the requirements for sensible economic transition policies.

During the period of the command economy the institutions necessary for effective and democratic decision-making were never successfully put in place. The system was often inefficient, dictatorial, and ultimately seemed to be incapable of achieving sustained growth. Nevertheless, this system was not an unmitigated failure, leaving some grounds for real optimism. High levels of education and human skill were achieved – Russia has a highly educated population, especially well trained in mathematics and science. Basic human needs were satisfied and essential physical infrastructure was constructed. Certain state-owned enterprises – even civilian ones – had accumulated technical know-how and skills roughly comparable to those of capitalist firms operating at the world technological frontier. Russia also has the remnants of an exceptionally equal income distribution and huge production capacity.

These educational, income distributional and production characteristics were critical in the postwar industrialisation of the now rapidly growing east Asian economies, and they provide a promising structural foundation for the re-industrialisation of Russia and eastern Europe after 1989. Yet, the architects of transition to a market economy uniformly regarded the legacies of socialism as pure liabilities. For ideological reasons, they rejected the entire socialist inheritance. In so doing their approach differed from that of Italy, Germany, and Japan after second world war, when those nations pragmatically made use of any possible positive inheritance that could be mobilised for reconstruction.

MARKET FUNDAMENTALISM IS BAD ECONOMIC POLICY

Russia is not alone in witnessing the destruction of its economy as the result of misguided policies. No central or eastern European country has put a new institutional system into place that can achieve a level of re-industrialisation or macro-economic growth anywhere near the economy's potential. This failure can be attributed both to the blanket rejection of any remnant of the immediate socialist past and, further, to the embrace by almost every country in the region of a simplistic capitalist experiment dating from the 18th century. This *laissez-*

faire model is simply not appropriate to the task of reconstructing industrial Russia and eastern Europe under the competitive conditions of technologically advanced, contemporary capitalism.

Even the most successful east European economies have managed to establish only a system of 'pseudo-capitalism', in which, for ideological reasons, few of the institutions essential for long-term capital accumulation have been introduced. What they have tried to create is by historical standards already outdated. The problems of creating capitalism after state socialism are unique, but instead of reaching toward a new economic and political system capable of catching up with the world's richest countries, a highly mythologised interpretation of the free market paragons, Britain and the US, has served as the model. In the absence of the institutions of a normal market economy, the Russian transition has led to a criminalised economy where criminals establish new institutions which are rewarding to their masters but dysfunctional for sustained economic renewal.

No revolution is ever completely successful in coming to terms with its own past, but few cases of waste on this scale can be found. Allowing first-rate firms to go bankrupt and world-scale research and development laboratories to deteriorate is simply an unmitigated disaster. Worse yet, the choice of a capitalist model that dates back to the 18th century and that represents an extreme, primitive form of market economy has failed in five years to lay the groundwork for the transition to a modern capitalist economy.

Elsewhere in the world compelling examples can be found of countries that have succeeded or are succeeding in their economic transitions – Japan, South Korea, Taiwan and, within the post-socialist camp, increasingly China and Vietnam. These nations became capitalist in their orientation, emphasising private property and the use of the market to acquire inputs and sell outputs. But the specific capitalist model these late-industrialisers have used was, in fact, new by world standards and drew nothing of significance from the American and British model of economic organisation. They bear little resemblance to the historical relic the post-socialist countries have worshipped in the first years of transition.

The approach of the successful late-industrialisers, however, represents something distinct: it has been capitalist in orientation yet a significant departure from either textbook theory or 18th – and 19th – century Anglo-American capitalist norms. This late-industrialising model has been successful not because reforms were introduced gradually (as in China and Vietnam) rather than in a great 'shock' (reforms in Hungary were also quite gradual),

but because it represented an attempt to adapt (customise) a capitalism to suit the realities of having to catch up with technologically advanced countries in a world economy. The advanced countries espouse free competition, but they exhibit pervasive oligopolistic business practices and extensive active government involvement in shaping and directing the economy.

The poor performance and the resulting political instability of the post-socialist countries have stemmed from copying the wrong capitalist model – voluntarily or otherwise. Until they learn from both their own past and the experience of successful late-industrialisers and piece together their own sensible policies, specifically geared to their current status, their efforts to restructure and to make a transition to a market economy will continue to sputter.

AN INSTITUTIONAL FRAMEWORK IS REQUIRED BEFORE MARKETS CAN 'WORK'

A critical difference between the classic capitalism that the Russians and eastern Europeans have tried to promote and the late-industrial capitalism that the east Asians have pioneered lies in the role of institutions in shaping the form, substance, direction, and pace of economic expansion. In the east European case, the role of institutions has been minimal; resource allocation has been left almost entirely to undirected and inefficient market mechanisms. When advocates of this 'market fundamentalism' refer to 'institutions' and the necessity of 'institution building' in order to foster capitalism, they have in mind a strictly limited agenda: the definition of property rights, contract law enforcement, and the removal of impediments to private enterprise. The use of the market mechanism was sharply different in the east Asian case, serving instrumentally rather than as a matter of ideological conviction. Institutions, including an activist state, assumed a major role in allocating investment resources. Institution building in this context refers not just to the establishment of clear property rights and contract law but also to the creation of private and public organisations capable of carrying out expansionary macro-economic policies as well as investment, trade, competition and technology policies. The post-socialist countries have thus far rejected the approach taken in east Asia. The command economy was in some way a caricature of capitalism: the size of business enterprise was not simply large, it was rigidly bureaucratic; the role of the state was not just activist, it was all-determining. Out of this dismal past and out of considerable naivete about how markets truly work (as opposed to how they are supposed to work in theory), post-socialist governments have chosen a brand of

capitalism strongly biased toward unregulated firms and weak states. This preference has been uncritically endorsed by many intellectuals, who fear that a strong state would stifle democracy (although history has proved that a weak state does not necessarily stimulate it) and hopeful that unregulated firms would nurture a middle class or create the incentives for economic growth.

Such a bias toward conservatism has been rigidly reinforced in eastern Europe by its bankers, the World Bank and International Monetary Fund, which had been set up after second world war to advance credits – with policy strings attached – to countries with economic problems. By the time of the transition, these organisations themselves had drastically changed. In reaction to the rise of the east Asian late-industrialisers, the western governments and economists exaggerated the virtues of free markets and, by means of the conditions that the World Bank and IMF attached to their loans, limited the policy menu open to post-socialist states.

In the post-socialist era, the eastern regions of Europe have been encouraged to specialise in low-end goods, despite equally gloomy prospects for success, returning to a place in the international economy roughly comparable to what it occupied in earlier centuries: that of a poor cousin in the division of labour with the rest of Europe.

In analysing the dire consequences of eastern Europe's choice of the wrong model, we focus on what can be learned from this costly error in order to develop a more sensible alternative for post-socialist late-comers. These post-socialist states must re-industrialise and create the economic institutions and macro-economic structure suitable for the task.

CONTRACTIONARY MACRO-ECONOMIC POLICIES

Although there have been substantial differences across countries, transitional macro-economic policies in the post-socialist lands have borne a strong family resemblance. In effect they have been a celebration of Say's Law, that supply creates its own demand and that markets automatically maintain equilibrium if wages are low enough. A pillar of transition economics, therefore, has been the reduction of real wages. One consequence of declining real wages, however, has proved to be a sharp and sustained fall in economic activity, which was more contractionary than either the transition economists anticipated or the final collapse of a command economy could explain.

With their own hypothetical model in mind, the economists who designed the global shocks and big bangs of the early 1990s did

not take into account the mechanisms for output determination that emerged on the eve of the post-socialist era. Transition planners thought that production would remain at the level of potential supply, just as it had been under the repressed inflation and soft budget constraints of socialism. The dynamic changes that the reformers did not foresee hinged on the effects on aggregate demand of the massive income redistributions induced by price liberalisations and inflation. As real incomes were cut, domestic demand fell to unforeseen depths.

Shock therapy suddenly removed all price and other administrative controls in the presence of the latent excess demand that had built up under planning and queues and shortages vanished almost overnight. But the only way that the resulting surge in attempted spending could be held down to available supply was by price increases. In most countries, enterprises raised their selling prices several-fold in the wake of liberalisation. Real wages dropped almost in proportion, forcing consumer spending to collapse at the same time that exports within the formerly socialist trading bloc imploded in a chain reaction. With no stimulus from consumer demand or exports, capital formation – the driving force of the planning system – also collapsed.

An ironic achievement of the period of early shock therapy and shock transition was effective destruction of the middle class that had emerged under the planning system. A large middle class of managers, skilled workers, specialists and researchers had grown up under the planning system. This was a professional, as opposed to property-owning, middle class but it was the part of the population that was most important to the process of economic renewal. The chaos and institutional disintegration of the shock transition period has damaged the buying power, the self-respect, and health of this part of the population. It has done this without providing the stimulus that could lead to constructive redirection of the skilled core of the population.

For all the talk of creating a market economy, the irony was that with plunging real incomes there were no effective markets in which firms could sell their goods. Total domestic output consequently dropped well below potential supply. Meanwhile, workers tried to recover the purchasing power that price increases had taken away. Their attempts were frustrated by policies aimed at holding money wages in check, but they still led to nominal labour cost increases that fed through the enterprise mark-up into an ongoing price spiral. Credit crunches and high interest rates along with increases in raw materials prices aimed at getting their levels 'right' also contributed to cost-push inflation in response to higher production costs.

The resulting combination of wage/price inflation and declines in production mean that an extreme form of stagnation is almost certain to persist over time, while the complex supply side linkages which were built up over decades of planning continue to unravel. This macro-economic situation can be expected to continue to deteriorate until post-socialist policy-makers create the means (and gather the courage) to control prices and encourage production through measures affecting both aggregate demand and supply, as do all modern capitalist nations. To achieve this kind of coherent transition, planners must go against the advice of ideologically driven western bankers and governments.

MICRO-ECONOMIC POLICIES WHICH DESTROY, NOT REVITALISE, THE SOEs

One of the highest costs of the shock therapy and shock approach to the transition has been a failure to grasp the potential of the organisations that existed in the early stages of transition, especially a significant number of inherently viable state-owned enterprises (SOEs). Their numbers far exceeded the ranks of reasonable buyers interested in privatisation, while their responsibility for producing the lion's share of industrial output and exports outstripped the instruments and resources made available to them for restructuring. At best, futile reliance on privatisation and market forces to restructure has resulted in lost time and missed market opportunities, particularly those associated with sustaining the growth of the SOE exports that boomed in the very early transition years. At worst, doing nothing has contributed to the erosion of skills and the deterioration of promising enterprises, thereby worsening unemployment and balance of payments disequilibria.

Russia's skill base at the time the transition began was one of its greatest assets. The average levels of education in the USSR and eastern Europe exceeded those of semi-industrialised countries in east Asia and Latin America and the quality of eastern Europe's educational system was excellent. But the industrial strategy in the first years of the transition implicitly amounted to 'getting the prices right' (reducing real wages and increasing capital and raw material costs) and specialising according to 'comparative advantage', or manufacturing a bundle of goods whose production techniques favoured the relatively cheapest available domestic factor inputs (land, labour, or capital). Such a competitive approach might make sense under *de novo* conditions of under-development with no industrial base, where lowering wages and liberalising imports might create a competitive edge for labour-intensive industries.

But the idea of specialising on the basis of factor-price comparative advantage makes no sense at all in a highly industrialised country which already has a broad base of capabilities, especially mid-tech industries, and a huge stock of accumulated human skills. At the time of the transition a wide array of industries and a diverse assortment of skills already existed in Russia, so relying on lowering real wages and abruptly liberalising imports to boost growth and efficiency has therefore left a large segment of industries out in the cold. Transition policies inappropriate to the existing level of development have resulted in de-industrialisation rather than re-industrialisation or a transition. Just after the transition began many heavy goods producers and the large engineering sector, for example, tended to be internationally cost competitive, at least in terms of labour costs. To the extent that they were unable to compete in world markets, it was due to low quality and outdated technology. Lowering real wages did not address their problems, but rather inflicted real injury by sharply lowering domestic demand. Rather than following comparative advantage, a more sensible industrial strategy would have been to focus on restructuring the most promising enterprises, whatever their industry.

To resolve the pervasive bottlenecks of low quality and outdated technology required time and money (substantial or modest, depending on the firm). Yet few private capitalists – certainly few local ones – were interested in tackling these long-term problems. Amid the transition's political uncertainties and erratic inflation rates, the objective of most capitalists was understandably a fast pay-back and a high rate of return, both of which were possible in many segments of the service sector. Without government intervention in the form of long-term restructuring of promising industrial enterprises, the threat of wholesale bankruptcy was very real. The failure of large SOEs also seriously endangered the health of small, new private manufacturing firms. The latter were typically dependent on the public sector for their inputs or final demand.

Resolution of the firm-size problem in Russia, moreover, could not simply be left to spontaneous market forces to rationalise whole industries or subdivide large-scale firms. The firm-size configuration that transition economists inherited was not only distorted in terms of too few small firms and too many large ones; it tended to be wrong in every direction. In a substantial number of leading industries firm (and plant) size was too small, requiring the hand of government (or some other long-term planning agent) to nourish enterprises to a scale sufficient to compete against the world's leading oligopolies.

Finally, for the defence industries of Russia even to begin the process of 'conversion' was inconceivable without long-term rationalisation; restructuring would be unavoidably time-consuming given the specialised technology of this sector and its lack of commercial products. Unemployment in this sector, given the high skill level of its employees, involves huge opportunity costs, while the chances for political dislocation are enormous.

An active role for the state in industrial restructuring is thus inevitable. The more this is openly acknowledged, the more rational and systematic government involvement can be. Instead, transition economists have shifted the entire burden of restructuring onto the shoulders of privatisation.

PSEUDO-PRIVATISATION

For transition economists and the World Bank, restructuring SOEs became identical to privatising them, which has not taken either meaningful or functional form. There was no consideration of restructuring before privatisation, or providing inherently viable enterprises with resources and an adjustment period to reach international competitive standards. It became an article of faith that SOEs were run either by crooks or by incompetents, and therefore providing them with the means to restructure before a change in ownership was assumed to be a waste of money. This sequence was out of the question because the conditions the World Bank attached to its structural adjustment loans effectively prohibited lending to public sector manufacturing firms.

In reality, transfer of ownership of SOEs (other than those engaged in petty manufacturing or small-scale services) to genuine capitalist (buyers with 'capital', broadly defined to embody technology and human skills as well as financial resources) has been virtually impossible. Socialism did not allow private accumulation on a scale large enough to enable even modestly capitalised enterprises to be privately bought at politically acceptable prices. Expectations about their enthusiasm for investment in Russia have proved highly exaggerated. Conditions attached to World Bank and IMF loans prevent offering incentives to foreign investors comparable to those available in China's special economic zones.

FOREIGN INVESTMENT: AN ILLUSORY AND UNNECESSARY SOLUTION

The history of direct foreign investment in Japan, South Korea, Taiwan, China and other late-industrialising countries suggests that typically such investment lags rather than leads growth. It enters when growth has

already gained momentum and then helps to accelerate it. Foreign investment has provided only a small fraction of total gross domestic capital formation. The foreign capital that has flowed into Russia and eastern Europe in the early stages of transition, particularly into the manufacturing sector, has been small in amount and unevenly distributed among a few countries.

The major motive of foreign investors in eastern Europe has been to exploit the domestic markets found there, not to allow the rise of rival producers in their home or third-country markets. Exactly the same is true in Russia, where a small amount of real foreign investment has been almost exclusively restricted to energy and raw materials. Real wage reductions, perversely, may have been more of a discouragement (in terms of reducing total demand, wiping out the core of the middle class and creating political instability) than an encouragement (in terms of lowering production costs).

Large foreign investors have also demanded protective tariffs or quotas against competitive imports as a precondition for investing in eastern Europe. Although a subsidy-free environment has been the goal of transition economists, make-shift incentives have become the reality within most post-socialist countries and in 'competition downward' between them. The latter kind of rivalry between weak and impatient governmental units (nations or regions) means that no one of them is able to bargain effectively with their mobile, patient foreign potential partners. Most foreign investment 'successes' that have been negotiated under these conditions have actually concealed large subsidies, anti-competitive arrangements or other developmentally disadvantageous features beneath the surface.

The fact that foreign investors are not bringing (and will not bring) the requisite credit, expertise and skills for capitalist development calls for a thorough policy reassessment in all of the post-socialist countries. As a study done for the United Nations Economic Commission for Europe observed, those devising policies and forecasting their outcomes may simply have gotten the policies wrong. Such a reappraisal has not so far resulted in a major policy shift on the part of either the IMF and World Bank or the post-socialist governments. Despite the mounting evidence that most managers of SOEs were honestly trying to restructure and that trade unions and employees' councils were not obstructing either privatisation or enterprise reform, there is still no willingness to allow restructuring before privatisation.

Because of the ideological conviction that virtually any means were justified to achieve privatisation, the privatisation method finally resorted to in desperation was one of

'giveaways'—shares in SOEs were distributed to adult citizens virtually free of charge. This 'pseudo-privatisation' attempted to create capitalism without any capital, or without the credit, skills, and expertise necessary to restructure now formally 'private' enterprises hindered by long-term bottlenecks.

INSTITUTIONAL FAILURES YIELD PSEUDO-CAPITALISM

Pseudo-privatisation has been emblematic of the pseudo-capitalism that has characterised the first years of transitional orthodoxy. The success of capitalism depends on the emergence of institutions to support long-term investment and risk-taking. The deep recession years of the early 1990s did not encourage serious institution-building along these lines. To relieve pent-up consumer demand, the early transition was notable for small investments in services (such as retail stores, restaurants and home-improvement construction). A distinction must be drawn between using the market for exchanging goods between small-scale firms and creating the institutions necessary for large-scale capitalist ventures.

In a simpler world, it took Europe, with minimal state intervention compared to the late-industrialising standards, centuries to achieve to industrialise. The transition economies of Russia and eastern Europe have largely succeeded only in inducing simple market exchange. They have also succeeded in creating substantial wealth for a few amid rising poverty for many, but that wealth has not come from the saving and investing behaviour at the core of real capitalism and real capitalist development. Given the political instability and the opportunities for short-term gain characteristic of the early transition period, the progressive face of capitalism seems unlikely to appear until a government emerges which is willing and able to induce long-term investments in new plant and equipment, starting real reconstruction.

In an ironic and somewhat perverse way the neo-liberal economists have proven the possibility of an effective developmental state in Russia. The dogged determination of post-socialist governments to privatise, with generous financial assistance from the IMF and World Bank and technocratic support from a well-paid, elite bureaucracy (the Committee for the Management of State Property) is evidence of what eastern Europe's educated societies are capable of achieving in the name of a strongly held goal. In the name of privatisation, these government agencies have accomplished what was assumed to be impossible in the name of restructuring: they ranked SOEs according to their future promise, based on information provided by professional management

consultants. In some countries they have even created state-owned banks to serve as the co-ordinating agents of further financial reform.

The ideological flexibility to begin reforming the government itself, however, is still lacking. Reconstructing the state is a step that is crucial in order to permit restructuring of industrial enterprises on the basis of a carefully considered, systematic, and clear set of policies. It is essential to admit, acknowledge and actively proclaim the active state responsibility for creating the conditions under which market relationships can function effectively and begin to yield some of the expected positive results.

WILFUL FAILURE TO LEARN FROM LATE-INDUSTRIALISING MODEL

What Russia, eastern Europe and other late-industrialisers share is the need to catch up without being able to depend on original technology. Their entry into world markets would be far easier if they were able to ride the dynamic of radically new technology such as was the basis for the economic development of both England and the US (and even aided 'backward' continental countries such as Sweden in catching up with world income leaders). In the late 20th century technological differences are a primary factor which makes Anglo-American and even western European development patterns entirely inappropriate for Russia and eastern Europe to try to follow. Late-industrialisers have had to grow predominantly through learning or borrowing foreign technology that has already been commercialised elsewhere.

With entry barriers to modern industry rising in the form of high research and development expenditures in advanced capitalist countries, it has become difficult for late-comers to leapfrog to the world technological frontier. Without the competitive advantage of radically new products and processes to determine the pace and direction of industrial development, the need for government guidance is much greater than in the past.

The Russian and eastern Europe governments have made few serious efforts to learn about the successes or failures of other late-industrialising regions. In eastern Europe this neglect results partly from an effort to assert a cultural identity with western Europe, but it is also due to lack of information. In Russia at least the former excuse is less relevant. The western economic doctrines that penetrated the Iron Curtain stopped short even of modern Keynesianism, let alone the east Asian approaches to development and transition. East Asian development has at its centre dirigism, where the state takes on a role which is strongly

directive, but relying on a mixture of privately-owned, mixed and state enterprise forms.

Because the east Asian experience – which has involved rapid growth and an activist state – so contradicted western economic philosophy, it has tended to be either ignored or misrepresented as *laissez-faire*. The 1993 World Bank study of the Asian Development Model is an example of the latter, carried to a form of self-parody. The late-industrialising model has also been ignored because it has been associated with dictatorship or authoritarianism, and because not all dirigiste late-industrialising regions have performed well.

Dismissal of the late-industrialising model is costly in terms of the lessons forgone. Two key ingredients in east Asian success have been strongly represented in Russia and eastern Europe in the early stages of transition: high levels of education and income equality. In Japan, South Korea, and Taiwan, high levels of education have underscored the efficiency of the bureaucracies in both the private and the public sectors. Equal income distribution prevented self-interested private concentrations of economic power from dictating economic policy. Government intervention in east Asia has been relatively effective partly because the government is powerful enough to impose performance standards on business in exchange for financial support.

If the post-socialist economies could actually succeed in matching, say, the growth rates of Brazil and Turkey from 1965 to 1980 (around 9 and 6 per cent per annum), or even the steady growth rate of India (about 4 per cent per annum), they would be doing rather well. Although it is unclear whether the spectacular east Asian growth rates could have been achieved under more democratic conditions, it is absolutely clear the primitive capitalism in Russia is undermining political democracy by failing to achieve even minimal rates of broad-based growth and development. Ironically, infringement on political liberty in post-socialist states has been justified by pragmatists as necessary for rapid economic development.

BEYOND SHOCK THERAPY AND NEO-LIBERAL PSEUDO-SCIENCE

Unfortunately, the economic policies of the early transition have severely under-utilised eastern Europe's human capital and either fatalistically accepted or deliberately provoked rising income inequality as a badge of the arrival of capitalism. There are clear links between the Russian/east European and east Asian experiences so it is vital to re-examine the conditions in Russia and eastern Europe that are conducive to re-industrialisation before time runs out and the remaining opportunities vanish.

Influential western economists insisted early in the transition that there was a broad theoretical and policy consensus regarding market reform. Yet, a complete set of structural and policy measures for the transition economies was never fully specified, and precisely what policy instruments were supposed to achieve which specific growth targets was not made clear. Reading between the lines, the neo-liberal consensus had at its centre a naive belief in the self-organising power of markets – in the spontaneity and automaticity of markets, as well as the ultimate wholesomeness of the outcomes they produced – regardless of surrounding conditions. Most of this array of policy prescriptions and proscriptions made on this basis were simply wrong and proved to be unworthy of the name 'analysis'. The mode of proof was generally 'argument by assertion' – the better known the advocates of shock therapy, the less rational argument was provided, as a rule.

The transition to capitalism required a more visible hand than neo-liberalism envisioned. The post-socialist transition can still succeed if orthodox economics and neo-liberal ideology yield to an approach grounded in the realities of modern economic life rather than free-market pieties. Such an approach to renewal dictates a five-part course of action:

(1) encouraging macro-economic expansion, mobilising positive supply-side dynamics. This will require treating inflation as one in a series of concerns and moving beyond the obsessive old style monetarism which treats inflation as the core concern of macro-economic policy and the lodestone of system performance;

(2) dealing with inflation through structural and regulatory approaches which admit and deal with the monopolistic structures which have arisen in Russia and stand in the way of the expected advantages of free markets;

(3) creating conditions under which viable state enterprises can identify themselves by their performance;

(4) giving these SOEs (as they turn into fully privately owned or mixed enterprises) adequate institutional support to allow a saving and investment process to take hold and further technical advance; and

(5) empowering a government bureaucracy that can harmonise the practice of political democracy with the degree of active economic governance that modern capitalism requires.

Recovery must commence from the truly disastrous conditions: there have been few successes at any level, with depressing numbers for output and inflation; avoidable enterprise collapses; financial misadventure; and much of the progress claimed for the privatisation is illusory. Even more disheartening is the extent to which the decay throughout the production structure continues.

There has been a political reaction to these economic failures, and the implications for the future are worrisome. In Poland, Hungary and Bulgaria centre-left governments have routed the original 'reform' governments from power, but lack clear alternative programmes. The stalemate in Russia has continued throughout the supra-constitutional period after December 1993, with the orthodox reform party a weak Duma minority and economic reform still largely a matter of inconsistent and ultimately reversible presidential decrees.

maureen ads.

The much lamented ability of enterprises and regions to thwart Moscow economic policy initiatives is in some respects good fortune, slowing or limiting the effects of ruinous policies. It may be possible to learn something from the blend of policies and tactics adopted by various city and oblast governments during this strange period of Moscow indifference to the extent of actual application of what are proclaimed to be national policies.

AN ACTION PROGRAMME FOR ECONOMIC SURVIVAL

It is not too late. A successful development policy is possible in Russia, but only on the basis of a very different economic policy with very different political foundations. Despite the many problems, other initial conditions in Russia and the east European nations are good. Most important among these are the relatively equal income distributions and the high education levels of post-socialist nations. The present tendency toward increasing inequality create social tensions and are likely to result in strong pressures for fiscally destabilising redistributive programmes (although reconstituting the minimum structure of the welfare state will be difficult enough). A high level of education is certainly a necessary, though far from sufficient, condition for productivity and income growth. The continuing decay of research and teaching facilities and conditions bodes ill for the future.

To capitalise on what remains of these advantages, prudently aggressive macro-economic policy will be helpful, despite the risks of inflation it entails. Analysts concerned predominantly with price stability often call for more austerity than sustained re-industrialisation can endure. In the postwar period, semi-industrialised countries that achieved steady output growth—including South Korea since the 1950s, China since the late 1970s, and Brazil between 1945 and 1980—did so under consciously expansionary macro-economic regimes. When conflicts arose between enhanced subsidies or cheaper credit for industrial development and macro-economic restraint, the latter was often sacrificed.

This is not to say that one should not be wary of severe macro-economic imbalances. After all, there was a wrenching stabilisation in Brazil in the mid-1960s, and its 35 years of rapid growth were cut short by the debt crisis. But maintaining industrial growth seems to require robust expansion of domestic and export demand. There is nothing worse for the investment plans and learning process of the private sector than a few cycles of repeated stop-and-go production. Well designed public investment projects, by contrast, usually stimulate private capital

formation in the so-called 'crowding-in' process little discussed in Russia.

To avoid recurrent stability crises the balance of payments and inflation have to be kept under tolerable control. Continued export growth and access to foreign borrowing are essential to external balance. Restrictions on capital movements can help keep the overall balance of payments in line and also permit internal cheap credit policies. It helps to have fiscal balance in which positive government saving (current revenues in excess of current expenditures including interest payments), and the difference between public investment and government saving (essentially the public sector borrowing requirement) should be no more than a few per cent of GDP.

Fiscal balance and real wages growing no more rapidly than labour productivity are essential for holding price increase in check. While an 'independent' central bank may be important as a symbol, price and wage regulation of the kind used in South Korea since the early 1970s may be a better tool for assuring relative price stability in a way consistent with overall growth. Such controls avoid the blunt and wasteful effects of credit crises and recessions regularly induced by monetary policy when it is forced to carry full responsibility for price stability.

Crucial macro-economic details can aid the industrial restructuring task. Cheap, direct credit should be accompanied by closed international credit markets and a state role (not necessarily control) in banking. Public development banks are the preferred model in most parts of the world. Externally, a weak exchange rate stimulates export growth, but may be difficult to maintain in a country like Russia with ample raw material endowments. Exports from such sources can obviate the need for a high local price for hard currency, making directed incentives for other export lines that much more essential. An undervalued currency also goes hand in hand with low real wages. Given the dramatic wage cutting during the transition period the political feasibility as well as the likelihood of a favourable economic response to further income reductions are low.

In a buoyant macro-economic environment, companies themselves can surmount the problems of the past, but only with the active co-operation of the state. The now vanished principal/agent structure of socialist enterprises puts planners with imperfect information in charge of managers who could sometimes pursue their own private interests. Both sides benefited from high material throughput, lubricated by the soft budget constraint. Outside easily privatised sectors like retail trade, the former principals have been replaced by public entities that still own the bulk of the large firms and must make them tick. Managers must learn capitalist

mentalities with their ongoing technical, investment and marketing education being more essential than the introduction of 'hard' budget constraints to industrial recovery and growth.

The key initial task is restructuring: management and technology problems have to be resolved, in order to allow potentially healthy enterprises to get under way. SOEs will have to shed some of the welfare responsibilities they carried under socialism, but this transformation must be done carefully and in a socially agreed upon fashion. This transformation may cause extreme fiscal difficulties even if done very carefully. A fundamental reorganisation of this relationship is essential if any sort of western-style democratic corporatist social order is to appear.

As firms (whether SOEs or POEs) reconstitute themselves, they will need institutional help. Finance for expansion has to be available, along with a favourable investment climate. Experience around the world shows that for nations not at the technological frontier, jointly mediated state and private sector procedures for 'picking winners' are feasible and indeed necessary for growth. The old Japanese criteria of supporting industries that sell products with high income elasticities of demand and in which rapid productivity growth would appear to apply just as well to the post-socialist countries as they did for MITI in 1950-70, for Korean planners in 1960-80, and for Chileans in 1970-90. Similarly, useful is the Korean practice of tying incentives to enterprise performance (especially exports), while using tariffs and quotas to ensure domestic producers an adequate cash flow from sales in the protected local market. Through indicative planning, self-destructive price competition and wide investment swings in sectors with scale economies can be avoided.

Such a planning operation will be needed because the price system is not the only bearer of economic information. Transmitting the messages the market does not carry is far easier among a reduced number of actors, and this simple fact points functional economic systems in the direction of large and/or collaborating enterprises, labour federations, and a bureaucracy that can guide producers to operate coherently with directed supports. All parties can ease the transmission of newly acquired technologies to the factory floor.

The free-market models that have been applied to eastern Europe do not recognise that successful semi-industrialised economies have shared these supra-market features. In due course, the worldview of the Washington consensus is bound to be replaced. There are also specific interventionist actions—co-operation between private firms and regional

authorities all over western Europe, the township and village enterprises in China, even American innovations like the Tennessee Valley Authority – which may find emerging analogs under post-socialism.

With democratic corporatist capitalism and a mixed economy as the general target, the last operational question is how to constitute an economically functional bureaucracy to control restructuring, privatisation, and then regulation and guidance of efficient enterprises (whether privately, publicly or otherwise owned). The human capital base and political tradition for an effective bureaucracy exist in eastern Europe. It will take a political act of will to bring it into being. Well-paid, competent privatisation ministries have been set up in several countries, in line with the ideological predilections of the reformers. The political process itself will determine how long it takes for effective indicative planning offices to emerge in their place.

REINVENTING GOVERNMENT: TRANSPARENCY AS A KEY TO RENEWAL

Reinventing planning is the other side of the coin of effective privatisation. What will not work is pseudo-privatisation, or the implementation of an idealised Anglo-American system which depends on owners/principals to impose economic efficiency on the managers/agents who run their firms by use of voice and threats of exit. Such a capital market is a textbook fiction. In practice, the post-socialist countries are likely to follow their western cousins by moving toward cartels, conglomerates and insider-based mechanisms for financial control. Embedded public/private collaboration in managing change goes together with this sort of ownership structure.

It is commonly argued that the Russian government is too corrupt to carry out the ambitious functions of an activist developmental state. This counsel of despair is especially self-serving, when it comes from advocates of the continuation of the current *laissez-faire* policy which has actively created the current conditions. Ignoring the self-interest of many of its proponents, this argument can be seen as a challenge to institutional creativity. How can the competitive, at least partially self-policing, features of a successfully functioning market economy be nurtured under current conditions? Transparency, in the sense of openness to public view, in the process of privatisation and institutional creation would do much to start movement in a positive direction. Making the process, terms and ultimate distribution of property rights and concessions public information would have a healthy oxidising effect on governmental conduct. Much of the secrecy and

manipulation of the current way of doing things has resulted from the fundamental unpopularity of the policies being pursued. It is true that the less that is known about unpopular decisions, the less the resistance. That is only an argument for secrecy when wise policy is being pursued – clearly not the case here, now.

POPULAR SUPPORT FOR NEW INSTITUTIONS KEY TO SUCCESSFUL REFORM

How can such economic development be made consistent with democratic politics? Sustained output growth (with enterprise ownership swinging gradually toward the private sector) will have to be guided by politicians and bureaucrats sharing the long view and holding considerable power over management and labour. Can all these parties coexist with changing elected leadership, and can they monitor both the reconstruction of the means of production and the reweaving of the social safety net? Societal answers to these interlocking riddles will have to be found before sustained output and employment growth can provide legitimacy for democratic politics and ratify the replacement of socialism by a humane mixed system in the former Soviet Union and eastern Europe.

The current neo-liberal policy regime is a developmental dead-end. It is unable to

achieve real reform because there is no broad democratic assent to the institutions and ground rules of the new system. Because neo-liberal doctrine has virtually no popular support it will require authoritarian tactics to maintain control as it uses its painful and unpopular methods (which are also bad development policy). Nothing done under these current conditions can be assumed to be permanent, so neither internal nor foreign decision-makers can apply rational appraisal techniques to economic life, only postponing and making more painful the unavoidable restructuring.

The political requirements for sustainable economic development which avoids widespread repression are consensus on semi-constitutional 'rules' establishing the institutions of a market economy – the array of detailed issues concerning property rights, the division between market and non-market decision-making and the rights of citizenship (which include the definition of individual entitlements) and the obligations of state/regional/city governments. While there can be no successful development without an active and coherent state role, there is no reason that this requires an authoritarian state. An array of policies more closely in line with Russian social and cultural traditions would allow economically rational policies to be pursued in a democratic context.

Migration, Urbanisation and Regional Inequality

Amitabh Kundu
Shalini Gupta

An analysis of migration patterns using data (on male migrants) from the census indicates a slowing down of population mobility over the decades since independence. This article focuses on the dynamics of migration and urbanisation in the context of the changing structure of economic development.

THE process of globalisation is increasingly breaking the economic barriers to trade and investment in the direction of making the national production systems a part of the global economy. Capital can move to any country and commodities can be produced anywhere seems to be the guiding principle. Natural resources can also be transported over long distances for being processed without prohibitive cost. Indeed, several multinational companies and individual entrepreneurs are producing commodities in the less developed countries at a low cost using their cheap labour and other natural resources. The process, it is hoped, would, through its multiplier effects usher in industrial development in these countries. However, for the process to work, the governments are expected to provide transparent and stable administration, maintain law and order and create a congenial and competitive economic environment. The state, it is argued, should thus facilitate entrepreneurs in taking their own decisions regarding output and employment mix, location, export, import, appropriation of profits, etc. Of course, some of the small entrepreneurs expect governments to provide certain infrastructural facilities and basic amenities. The big companies are, however, often willing to undertake this responsibility themselves, in exchange of long-term agreements or for certain special fiscal and administrative concessions.

The emphasis is, thus, on production activities being allowed to move to the areas where the labour and natural resources are unutilised or underutilised. The underlying assumption seems to be that it is far more difficult and costly to move labour to centres of production and make appropriate provision for them rather than shifting the production base. Economic liberalisation is, thus, expected to reduce economic inequality at the global level through acceleration of growth in less developed countries which, in turn, would reduce their outmigration of labour. The industrialists setting up production units in these countries may not consider slowing down of population mobility as their avowed objective but that would be the logical outcome of their decisions at the macro level. The policy of liberalisation,

which implies greater movement of capital and natural resources, may, thus, be associated with growing immobility of workforce and population. It is indeed true that during the past couple of decades, when the constraints to movement of commodities have been relaxed or removed, such constraints for the movement of people, and in particular labour, have been strengthened. In view of the above trend, it would be important to analyse the migration pattern across regions to assess whether, and if so, to what extent, the population has become immobile over the past couple of decades. It would also be interesting to identify the socio-political and

institutional factors, besides the pure economic factors, responsible for the possible decline in labour mobility.

The hypothesis regarding decline in spatial imbalance and slowing down of population mobility can be examined at different levels. Besides the global level exercise done by taking the countries as the units of observation, one can do the analysis across regions within a country or a state. It would, for example, be worthwhile to analyse whether regional disparity in a large country like India has gone down with economic growth over the years and how that has affected population mobility. Indeed, it is

TABLE I PATTERN OF INTERNAL MIGRATION IN INDIA, 1961-81
(Number of migrants in millions)

	1961	1971	1981	Growth Rates	
				1961-71	1971-81
Total population	438 90	548 20	665 30	24.88	21.37
Total migrants					
Intercensal	66 10 (15.06)	68 20 (12.43)	80 10 (12.17)	3.18	18.77
Lifetime	135 30 (30.38)	157.40 (28.70)	195 80 (29.50)	16.31	24.38
Male population	226 20	284 10	343.90	25.66	21.13
Male migrants					
Intercensal	25.60 (11.30)	26.80 (9.42)	30.40 (8.85)	4.65	13.75
Lifetime	41 90 (18.50)	48 80 (17.20)	57.20 (16.80)	16.63	17.10
Female population	212.80	264 10	321.40	24.12	21.68
Female migrants					
Intercensal	40.50 (19.01)	41.40 (15.68)	51.50 (15.72)	2.33	22.02
Lifetime	93.40 (43.90)	108 60 (41.10)	138.60 (43.10)	16.27	27.62
Rural males	183 20	225.30	260.00	22.98	15.40
Rural male migrants					
Intercensal	15 40 (8.39)	15.90 (7.06)	16.30 (6.27)	3.58	2.32
Lifetime	25.70 (14.00)	29 10 (12.90)	30.00 (11.09)	13.30	3.14
Urban males	42.80	58.70	83.90	37.15	42.93
Urban male migrants					
Intercensal	10 20 (23.83)	10.90 (18.48)	14.20 (16.86)	6.37	30.41
Lifetime	16.20 (37.80)	19.70 (33.60)	27.10 (32.40)	21.93	37.73

Notes: The figures in brackets are percentages to the corresponding total population. Lifetime migrants are those that were enumerated at places other than that of their birth. Intercensal migration figures are based on the concept of place of birth for the year 1961. For 1971 and 1981, the figures are based on the concept of last residence implying that the people residing anywhere other than the place of enumeration are considered migrants. The figures for 1981 do not include Assam as Census could not be conducted there. The data are obtained from the Migration Tables in various Population Censuses.

impossible to analyse the impact of liberalisation programme on movement of population as no reliable data on migration are available after 1991, the year in which the programme was formally launched by the government of India. What would, nonetheless, be interesting is to analyse the pattern of regional disparity and migration since independence, viz, 1947, and see if the two reveal some kind of association. Based on the past trend and the stipulations of the liberalisation strategy, it should then be possible to speculate on the trend of regional disparity in the 1990s and its impact on the mobility of population.

An attempt has been made in the present paper to examine whether there has been a slowing down of population mobility over the decades since independence and if so, whether that can be attributed to investment in backward areas and consequent decline in regional imbalance. Importantly, measures to remove administrative controls and let loose the forces of free market were adopted, although in an ad hoc manner, since the 1970s. Consequently, the impact of liberalisation on regional disparity can, to an extent, be assessed from the state level data for the 1970s and 1980s, as attempted in the paper. Similarly, the migration pattern has been analysed at the state level using the data on male migrants only from the Population Census. Only the male migrants have been considered in the study since female migration in India is attributed largely to marriage, joining the family and other social factors. Also, female mobility is likely to change only over a long period of time with changes in social customs and practices whereas male migration is likely to respond directly to the changing economic scenario. The thrust of the paper being on the dynamics of migration and urbanisation in the context of changing structure of economic development, the exclusion of female migrants can be defended. The pattern of female migration has, nonetheless, been analysed at the national level, with the specific objective of comparing it with that of the male counterpart.

Kingsley Davis, in early 1950s, in his pioneering work *The Population of India and Pakistan* had observed that the population of the Indian subcontinent was relatively immobile. He attributed this immobility to prevalence of caste system, joint families, practice of early marriage, diversity of language and culture, lack of education and predominance of agriculture in the economy. It is argued that a society bound by caste and family system and traditional values often acts as a deterrent to migration. By the same logic, improvement in the levels of education and that of transport

and communication facilities would increase mobility. Interestingly, however, an analysis of the trend in population mobility in India reveals that, despite significant improvements in education, transport and communication facilities, growth of industries, diversification of the economy, modernisation of norms and values, etc, population mobility has declined during the recent decades.

The pattern of internal migration (excluding the international migrants) for males and females during the 1960s and 1970s has been presented in Table 1, giving the figures for both intercensal as well as lifetime migrants separately. It may be seen here that mobility

of population has, in general, declined both in rural as well as the urban areas during 1961-81. The rural and urban male population increased by 23 and 37 per cent, respectively, during the 1960s whereas the growth rates of intercensal migrants were around 4 and 6 per cent, respectively. The lifetime migrants, too, grew at a rate smaller than that of total male (population), the figure (for rural and urban areas) being 16 and 22 per cent, respectively. During the 1970s, the growth rates of intercensal and lifetime migration for urban males were 30 per cent and 38 per cent, respectively. These were below the growth rate of urban population in the decade

which was around 43 per cent. Importantly, there has been a significant fall in the growth rate of migrants from rural areas during the 1970s. The growth rates of intercensal and lifetime male migrants work out as 2 per cent and 3 per cent during 1970s whereas the rural population registered a growth rate of 15 per cent. The percentage of intercensal male migrants (rural and urban combined) within the country has thus gone down from 11.3 per cent in 1961 to 9.4 per cent in 1971 and further to 8.8 per cent in 1981. The corresponding percentage figures for lifetime migrants are 18.5, 17.2 and 16.8 at the three points of time.¹ The pattern is somewhat different for the female counterpart. The female migrants grew at a slower rate than the population during 1960s both for intercensal and lifetime migrants. The pattern being the opposite in the 1970s. The percentage of female migrants, therefore, declined during 1961-71 but increased marginally during 1971-81.

Table 2 presents the structure of intercensal migrants disaggregating them into four streams, viz, rural to rural (RR), rural to urban (RU), urban to rural (UR) and urban to urban (UU). Each stream has further been broken down into three categories based on the nature of movement, viz, within the district, across the district but within the state and across the state. A slow growth of migrant population may be noted in case of most of the streams. The decline is particularly noticeable in case of RR stream. Besides, the percentage of interstate migrants to total migrants has gone down from 19.83 to 19.18 during 1960s and further to 18.14 during the 1970s. Other factors remaining constant, one would expect an increase in this figure due to emergence of several new states during the period. The decline, therefore, is significant and must be interpreted as a process of slowing down of population mobility across the state boundaries. It may be argued that the migrants are increasingly getting absorbed within their own states, possibly due to socio-political factors, constraining their mobility. The decline in inter-state migration is largely due to the decline in the RU stream. This can perhaps be explained in terms of deceleration of growth in the large cities in the developed states that attracted the rural poor from the backward states. These people, coming from distant areas, are not able to find a shelter for themselves, possibly due to city planning restrictions imposed in these cities, growth of regionalism, overcrowding and lack of basic amenities to the poor.

The component of intradistrict migrants has also gone down but this is directly linked with an increase in interdistrict component. This may partly be explained in terms of the

increase in the number of districts during 1961-81. Many people classified as intradistrict migrants in 1961 Census got classified as interdistrict migrant in the subsequent censuses in case of a division of the district. The disaggregated data on migrants in different streams suggests that movement to urban areas (from both rural and urban areas) within the state has gone up significantly during 1971-81, compared to the previous decade. The growth rates are higher than the corresponding rates for interstate migration. This implies that during 1970s, migration within the state contributed more to urban growth compared to that in the previous decades as also the migration across the states.

The growth rates of female migrants have always been higher than the corresponding growth rates of male migrants. This has resulted in an increase in the sex ratio, defined as females per thousand of male population, in all the streams (Table 2). The basic reason for this is that unlike the male migration, female migration is, to a great extent, relatively independent of the economic factors and has not declined much over the years.

INSTITUTE OF DEVELOPMENT STUDIES

8-B, Jhalana Institutional Area, Jaipur 302 004

Applications on plain paper with complete bio-data are invited for the following faculty/research positions:

1. CHAIR PROFESSOR IN RAJASTHAN ECONOMY AND SOCIETY

Should be a well known scholar of high calibre in any area of social sciences with evidence of interdisciplinary approach and should possess ability to provide intellectual leadership. Other things remaining equal, a scholar, who has intellectual involvement in the economy and society of Rajasthan, would be preferred. He/She would be expected to engage in studies and dialogues of importance to the development and growth of Rajasthan. The appointment would be for an initial period of three years. The salary is negotiable but could be upto the maximum of Senior Fellow/Professor's scale.

2. ASSOCIATE FELLOW (Lecturer), Women's Studies (for one year in the first instance)

The candidate is expected to have Post-graduate degree in any of the Social Sciences or in other relevant area of Women's Studies, preference will be given to one with Doctoral degree. Experience of research/training/project formulation/consultancy in gender studies and related aspects is expected. A senior position, that of a Fellow (Reader) may be offered to the candidate with superior scholastic achievements and relevant field experiences. The remuneration in the prescribed UGC scale will be fixed according to the qualifications and experience.

3. CO-ORDINATOR – NGO and Panchayati Raj Centre (temporary for two years but likely to be extended further)

The incumbent should be a post-graduate in any discipline with adequate research and/or work experience in rural development, Panchayati Raj and voluntary action.

The position may be filled by direct recruitment or by deputation from Government/autonomous body, Non-Governmental Organizations on contract basis.

4. RESEARCH OFFICER – Livelihood Strategies: Gender, Civil Society and Public Action (for nine months)

The candidate should be MA in Sociology/Anthropology – desirable M.Phil. Remuneration according to qualifications but not exceeding Rs.5,000/- per month (consolidated).

Applicants giving (a) full personal details, (b) academic qualifications, (c) special training, (d) relevant experience, and (e) names of three referees should reach the Director, **Institute of Development Studies**, 8-B, Jhalana Institutional Area, Jaipur 302 004 within 15 days of the appearance of this advertisement, marking the envelope with the post applied for.

territories in the country are presented in Table 3 for 1961, 1971 and 1981. The regional variation in the percentage of migrants provides interesting insight into the development dynamics in the country. It may be seen in the Table that the backward states like Bihar, Jammu and Kashmir, Uttar Pradesh, Rajasthan, Orissa, etc., report a low percentage of male migrants in 1961, 1971 and 1981. The only major exceptions are the states of Madhya Pradesh and Andhra Pradesh.³ The developed states, on the other hand, show high figures, generally above the national average. Here the exceptions, viz., reporting low migration rates, are Haryana and West Bengal. One must, however, add that the smaller states like Assam and Himachal Pradesh (as also the north-eastern states like Meghalaya, Nagaland, Sikkim, not included in Table 3) exhibit high immigration rates because of massive government effort for developing the administrative infrastructure and basic services in the post-independence period [Kundu 1995]. Importantly, there is a declining trend of migration in almost all the states.

The percentages of interstate (lifetime) immigrants in Table 4 shows variation across the states similar to that of total migrants in Table 3. High rates are registered for rural as well as urban areas in most of the developed states like Gujarat, Haryana, Karnataka, Maharashtra, Punjab and West Bengal with the significant exception of Tamil Nadu. The smaller states like Assam and Himachal Pradesh (as also Meghalaya, Nagaland and Sikkim, see Kundu 1995), once again, report high immigration. The less developed states, on the other hand, report low incidence of interstate immigration, as expected. Madhya Pradesh emerges as an exception, registering high rate of immigration. This may be explained in terms of massive public sector investment and expansion of linked tertiary activities in the states, attracting workers from other states.

Table 5 provides the spatial profile of interstate (lifetime) outmigration from both rural and urban areas. Here, the pattern appears to be just complementary to that of immigration, as noted in Table 4. The backward states like Bihar, Himachal Pradesh, Kerala, Rajasthan and Uttar Pradesh have high outmigration rates in all the years under consideration for both rural and urban areas. Only Madhya Pradesh and Orissa emerge as exceptions. People in these two states, possibly due to illiteracy, traditional background, etc., are unable to become a part of the national labour market and avail better prospects outside the state. The case of Punjab and Haryana, reporting high outmigration from both rural and urban areas, is partly due

to their being a part of one state in the early 1960s. After the bifurcation of the state of Punjab (in 1966), many among those who had moved within the state, got classified as interstate migrants due to jurisdictional changes. Importantly, there is a decline in the percentages of both interstate immigrants as well as outmigrants (lifetime) for most of the states (Tables 4 and 5).

The analysis of intercensal (interstate) immigrants, too, reveals that male mobility has declined across all the major states (Table 6). The states reporting percentage of immigrants higher than the national average in 1981 are Gujarat, Haryana, Karnataka, Maharashtra, Punjab, Tamil Nadu and Himachal Pradesh. Important point to note is West Bengal, which had a high percentage of immigrants in 1961, has registered a drastic decline, so much so that its value is less than

the national average in 1981. Also, the urban figures for the backward state of Himachal Pradesh are very high – much higher than that of many developed states closely followed by Orissa at all the three time points.

It has been mentioned above that the percentage share of inter-state migrants has been diminishing gradually over the years. The figure has declined sharply in all the developed states except Gujarat, Punjab and Haryana (Table 7). The fall in the value for West Bengal from 43.4 per cent in 1961 to 25.6 per cent in 1981 is indeed very significant. The increase in case of Punjab and Haryana can be attributed to the bifurcation of the state, as discussed above.

Rates of net interstate (intercensal) migration are presented in Table 7. It can be noticed that except Tamil Nadu all the

Source: Based on data obtained from the Migration Tables, Census of India.

developed states have observed a positive net immigration at all the three points of time.⁴ However, there has been a steep and consistent decline in the rates of net immigration in most of these states like Karnataka, Maharashtra, Tamil Nadu and West Bengal. Correspondingly, the rate of population loss through net interstate migration has gone down quite substantially in the backward states. Among the backward states, Madhya Pradesh reports positive values for net interstate migration at all the three points of time while Orissa becomes net immigrating state in 1981.

It is not possible to analyse the mobility pattern during 1980s, as the migration data at all-India level for the year 1991 have not yet been published by the Population Census. An attempt has, therefore, been made to estimate the interstate migration during the 1980s on the basis of the difference between the actual population count and the projected population for 1991, as presented in Table 8. The population figures at the state level have been projected by using the average of the natural growth rate of population for each state for the two preceding decades, taking

rural and urban areas separately (column 3). Applying the female-male ratio, as reported by the Population Census (column 4), the population estimates for the males have been worked out (column 5). Since the estimated total of male population for the country as a whole, obtained by aggregating the state level figures, varies from the actual total, a correction factor has been worked out which is the ratio of the actual to the estimated total population. Now, by multiplying the state level estimates by the correction factor, we obtain the revised estimates of the state population, excluding the migrants (column 8). Estimated net interstate migration for the 1980s – the difference between the actual population count and the revised estimates – is given for the major states in column 9 in Table 8.

It is interesting to note that several backward states, namely, Andhra Pradesh, Himachal Pradesh, Madhya Pradesh and Rajasthan have positive net interstate migration during 1981-91. The developed states, on the other hand, have registered negative net interstate migration barring Maharashtra and West Bengal. One can

possibly explain this in terms of the natural growth rates in many of the developed states during 1981-91 being less than the average as estimated above. However, substantial outmigration or return migration in case of the developed states emerges as a strong possibility. One can also argue, based on the results of Table 8 that the development process in the backward states is drawing many migrants from other states.

Migration data from the Population Census of 1991 for a few states have recently become available. Interestingly, an analysis of this data [Premi 1996] confirms the trend observed for the preceding decades. Also this broadly corroborates the results, derived for the 1980s based on our conceptual model, as presented in Table 8. Table 9A gives the aggregative data on lifetime interstate migrants for the states of Andhra Pradesh, Haryana, Karnataka, Kerala, Punjab and Tamil Nadu (for which the data could be available) for four census years. It may be noted that the percentage of the migrants among males has declined systematically since 1971, both for rural as well as urban areas. The fall is sharp during 1981-91, the

Notes: (1) All-India figures exclude Assam and J and K (2) Correction factor (CF) has been worked out on the basis of all-India estimated population and actual population. The formula is $CF = \text{population count in 1991} / (\text{Estimated Population in 1991}) = (411172370 - 423558369) / 411172370 = -1.030123617$. The corrected estimates of male population in 1991 have been worked out by multiplying the estimated male population by 1.030123617.

percentage figure coming down from 2.0 to 1.1 in rural areas and from 7.6 to 5.1 in urban areas. Importantly, the figure has come down even for the females from 4.3 per cent to 3.5 per cent during this period. There is, thus, no doubt that an average Indian has become less mobile since the early 1970s, the process being rather sharp in case of the decade 1981-91.

Furthermore, the percentage of interstate migrants (to the total migrants) seems to have gone down marginally, as one would infer from the figures for the southern states in Table 9B. The increase in the figure in the case of Punjab and Haryana can be attributed to the socio-political disturbance in the region which has caused a lot of population mobility. The decline in the movement between the states of Punjab and Haryana can, however, be inferred from the fact that the percentage of lifetime migrants in Punjab coming from Haryana (to the total lifetime migrants in Punjab) is higher than the corresponding figures for intercensal or current migrants in 1991. The same is true for the migrants from Punjab to Haryana (Table 9C). One would infer that present level of movement between the states is much less than what has been observed historically.

INTERSTATE DISPARITIES.

Migration, urbanisation and regional disparity are strongly interrelated. An attempt to understand the underlying forces and their interrelations would be extremely useful in the context of the development dynamics in a large country like India, as discussed at the very outset of the paper. Scholars have analysed the spatial structure of development based on the trend in net state domestic product (NSDP) in per capita terms, across the states. There seems to be a general agreement that regional disparity has gone up since the mid-1960s, after a slight decline in the 1950s and early 1960s. The Task Force on Urban Development (1983) reports an increase in the disparity, measured in terms of coefficient of variation (cv), in per capita NSDP. The figure has gone up from 23 per cent in 1961 to 26 per cent in 1971 and further to 32 per cent in 1981. Taking the average value for five years, it is observed that the cv was 22.6 per cent only for the period 1970-75 which increased to 29.1 per cent for 1980-85. In the year 1993, the cv has gone up further to 32.2 per cent [Kundu 1996]. Hashim has computed three yearly averages for per capita state incomes around the base year for 1971, 1981 and 1991. The cvs are computed as 31.5, 37.2 and 39.2 for the three time points, respectively.

The disparity can be noted to be going up in terms of various other economic indicators

as well. The interstate disparity in monthly (per capita) consumption expenditure has increased from 11.1 per cent in 1973-74 to 17.3 in 1992, as per the data available from the National Sample Surveys. Similar increases in disparity can be noted in case of other infrastructural facilities and basic amenities like power consumption, transport system, health services, etc. In some of the social dimensions like access to education, water supply and sanitation facilities, the regional disparity has, however, registered a decline. But in the other social dimensions, viz, incidence of poverty, population growth, infant mortality rates, etc, the disparity has gone up.

That the inequality should increase in terms of these crucial indicators, despite the planning strategy in India designed with the avowed objective to reduce it, must make the planners concerned about the inadequacy of their efforts and the nature of inherent growth dynamics in the country. At a higher level of generalisation, one would argue that despite an acceleration in economic growth in many of the less developed countries and reduction of spatial inequality at the global level, after launching of the programmes of liberalisation, regional imbalance within the countries can go up in important economic and social dimensions. Clearly, India is a case in hand, wherein regional inequality has increased despite high economic growth. Particularly important is the fact that during the 1980s, when the economy was growing at about 5.5 per cent annually in real terms – which is a record by any standard – there was an accentuation of interstate inequality.

Spatial disparity in development should, *ceteris paribus*, encourage migration towards the developed states and regions, as per the neoclassical models of growth and labour mobility. Interestingly the migration pattern in India, as observed through the data of 1961, fits well in these models that assume that optimality in the spatial distribution of economic activities in the long run would be brought about through free movement of the factors of production. Indeed the backward states had high rates of outmigration while the developed states were absorbing these migrants.

In recent decades, however, migration in general and interstate migration in particular, shows a different pattern, as discussed above. Despite significant increase in regional disparity, migration has gone down. The outstanding feature of the changing pattern of migration is a clear shift from the colonial pattern wherein people moved from the impoverished hinterland to a few developed regions or large cities, often across the states. As a result, the developed states in the 1990s report a much lower percentage of in-migrants

than in the previous decades. As a corollary to that, outmigration from the backward states has gone down. Besides, there is an increasing incidence of intra-state migration, in relative terms, especially in these states.

Some scholars have explained the decline in interstate migration [Mehrotra 1974] in terms of developmental programmes, launched by the state governments in the post-independence period. Persons who used to migrate out of the backward areas in search of jobs are now often able to find means of livelihood at their own places. Availability of education, health and other services has also stabilised the population in backward regions, it is argued. Similarly, better communication and transport facilities have alleviated the need to move for employment, study, etc, since people can now commute to distant cities, providing employment. Undoubtedly, there is some truth in these arguments but they do not explain the growing immobility of population in a satisfactory manner. Also, an analysis of regional structure of development would discount this hypothesis since inter-state inequality in several dimensions of economic and social development has gone up over the years, as discussed above. A better

TABLE 9A: PERCENTAGE OF LIFETIME INTERSTATE MIGRANTS FOR ANDHRA PRADESH, HARYANA, KERALA, PUNJAB AND TAMIL NADU

	M	F	M	F	M	F
From Haryana to Punjab	15.2	34.3	12.4	29.2	10.4	19.8
From Punjab to Haryana	22.9	23.4	17.7	22.6	12.8	17.8

explanation can possibly be found in terms of growing assertion of regional identity, education (up to high school) in regional languages, adoption of master plans and land use restrictions at the city level, etc., all these directly or indirectly discouraging migration [Kundu 1983]. This would seriously discount the proposition that the mobility of the factors of production, operationalised through the market, would automatically ensure optimal distribution of economic activities in space.

Another complementary explanation of this changing scenario of migration can be provided in terms of increase in intra-state inequality in the post-independence period. In each state, a few large cities – usually the state capitals – emerged as centres of industrial investment as these had an advantage of having an industrial base and a higher level of basic services. These centres received a large chunk of the subsidised amenities provided through their state governments that attracted the elites, professionals and industrialists. As a consequence, most of the backward regions or districts received very little of the subsidised amenities and of the private investment coming into the states. This resulted in movement of people from backward to developed regions/large cities within the state. Besides, growth of agriculture was extremely uneven in space, increase in land and labour productivity being restricted to a few districts only, due to the strategy adopted in the late 1950s and early 1960s. This sharpened inequality and encouraged intra-state migration, particularly from rural to urban areas.

It is also striking that many of the backward states have experienced rapid urban growth during the past three decades [Kundu 1992]. The fast growth here is due to the rapid growth of small and medium towns and emergence of new towns. A sizeable proportion of these fast growing and new towns are taluk or taluk headquarters. It may be argued that with the decline in interstate migration, the small and medium towns, located in the backward states, are absorbing migrants from the impoverished hinterland. Many among these have a low level of basic services and poor quality of infrastructure. These may, therefore, be growing without any capacity to sustain the incremental population. This indeed should be a matter of concern for the policy-makers.

The problem of decline in the rate of outmigration from the backward states, namely, Bihar, Madhya Pradesh, Rajasthan and Uttar Pradesh and their absorption within the rural areas and in small and medium towns becomes far more serious since these have high rates of natural growth. Indeed, the burden of absorbing the growing labour force productively in the economy has

become more difficult in recent years with the fall in the rate of outmigration from the backward states.

Economists advocating the opening up policy in agricultural sector have argued that a 'suction mechanism' is in operation within the Indian agrarian system whereby the regions with high and growing land productivity are able to attract migrant workers from other regions. This, they believe, results in equalisation of labour productivity in space. Analysing the data on land productivity and labour absorption from a different analytical perspective, Alagh, Bhaduri and Bhalla (1982) have come to a similar conclusion. It is possible to use their stipulation to build up a rationale for adopting a development strategy in agriculture, focusing on only select regions having a high growth potential, as often proposed under the liberalisation policy. However, with a sluggish growth in rural to rural migration (also interstate urban rural migration which has a component of agricultural labourers), the possibility of migrant workers, coming from across districts and states sharing the benefits of concentrating agricultural development strategy in a few districts seems rather bleak. Unless the reasons for increasing immobility are properly understood and the factors responsible for it appropriately tackled, it would be dangerous to follow the strategy of pumping in subsidised technological inputs in select districts or leave the process of agricultural development to be determined by global market forces.

The growth of manufacturing sector in the 1990s is also likely to be concentrated in a few developed states and large cities as the locational controls and programmes to promote industries in backward regions are being gradually withdrawn. This would invariably accentuate the interstate and intra-state disparity in industrial development. As a consequence, urban growth, too, may get further polarised around a few big industrial centres and the problem of finding productive employment in the backward states, particularly in their backward districts, would become far more serious in future years.

To conclude, the decreasing mobility of the population poses a major challenge for the development strategy being followed in countries like India and their development perspective. The policy of unbalanced development, if continued despite this ominous trend, can have serious negative implications. It is, therefore, important that these implications are examined with empirical rigour. Also, measures should be worked out, if possible, to stall this declining migration trend. However, if the dynamics of population distribution happens to be largely beyond the scope of governmental policies, there seems

to be no choice but to adopt a policy of balanced regional development and disperse economic and employment opportunities to backward regions through a planned effort.

Notes

- 1 The deceleration in the growth rate of lifetime migrants can not be explained in terms of mortality factor associated with the international migrants (born in Pakistan or Bangladesh, coming to India at the time of partition) over the years, since we have taken only the internal migrants into consideration.
- 2 The regional analysis has been done by taking male migrants only and all the tables onwards take only the males into consideration.
- 3 Orissa, too, reports a high percentage of migrants but only in urban areas, followed by Bihar.
- 4 Punjab of course is a special case in this context because of the division of the state in 1966, as mentioned in the text above.

IDBI

FOR the first six months of 1996-97 the Industrial Development Bank of India (IDBI) has posted a net profit of Rs 514 crore against Rs 503 crore in the corresponding period last year. Due to a comparatively lower number of large projects assisted during this period, overall sanctions declined from Rs 10,836 crore in the first half of the previous year to Rs 8,342 crore. While total operating income of the company during the period rose by 18 per cent to Rs 2,776 crore, income from direct loans, which is the major segment of IDBI's business, recorded a growth of 24 per cent.

Restructuring the Tax System

Hiranya Mukhopadhyay

I

IN a recent paper K Sundaram, V Pandit and B Mukherji (henceforth KVB) argued that cascading type tax (CAT) is better than VAT (or rather, rebate-adjusted tax system, RAT) because it can generate same revenue (sector by sector) and replicate VAT prices with lower *ad valorem* duty rates, thus providing lower incentives for tax evasion.¹ It is worth mentioning that whenever pricing is done on the basis of total cost (including input duty) and then allow for set-off for input duty, revenue neutrality will not make any difference between the pre-VAT and post-VAT prices. Prices will be identical. That is precisely the reason for the result cited in their paper. The price equation in their paper with the multiplicative mark-up is,

$$v_i = (1+s_i)(1+\theta_i)(w_{0i}+a_{2i}v_2 - s_{2i}a_{2i}v_2/(1+s_2))$$

where, v_i 's and s_i 's are duty inclusive prices and *ad valorem* tax rates in two sectors. Needless to say, pricing is done on the basis of total cost inclusive of input duty.

II

Let us elaborate our point with the help of a fixed coefficient production function. The price equation with fixed coefficients of production is,

$$P = \{\Sigma a_i(1+t_i)p_i + W\} (1+r) \quad (1)$$

Where,

a_i 's are the input-output coefficients
 t_i 's are the respective *ad valorem* duty rates levied on inputs
 p_i , the input prices exclusive of duties
 W , wage cost inclusive of other manufacturing cost
 r , is the mark-up rate

In the above expression, total input duty is given by

$$T = \Sigma a_i t_i p_i \quad (2)$$

If the finished product is taxed at the *ad valorem* rate 't', the duty inclusive price P' is given by,

$$P' = P(1+t) \quad (3)$$

Note that P' can also be written in the following way:

$$P' = \{[\Sigma a_i p_i + W](1+r)\} + \{[\Sigma a_i p_i + W](1+r)t\} + T + T\{t(1+r)+r\} \quad (4)$$

In equation (4), the first term refers to total production cost, the second and third term refer to total excise revenue (net of duty on input duty (tT) plus duty on mark-up on input duty (trT)) on output and input respectively and the last term to cascading effect.

Under the VAT scheme, when prices are set on a 'net cost' basis with set-off, the price equation is given by,

$$P^* = [\Sigma a_i p_i(1+t_i) + W - \Sigma a_i p_i t_i](1+r) \quad (5)$$

which is simplified to

$$P^* = [\Sigma a_i p_i + W] (1+r) \quad (6)$$

and the final price is determined by

$$P'' = P^*(1+t) \quad (7)$$

Revenue neutrality in the case of 'net cost pricing' implies that pre-VAT revenue is equal to post-VAT revenue. That is,

$$[\Sigma a_i p_i(1+t_i) + W](1+r)t + T = [\Sigma a_i p_i + W](1+r)t' \quad (8)$$

Therefore, statutory duty rate of the final good after VAT (t') is (henceforth, $\Sigma a_i p_i + W$ is denoted by c),

$$t' = t\{1 + (\Sigma a_i p_i t_i)(1+r)/c(1+r)\} + T/c(1+r) \quad (8)$$

$$t' = t(1+T/c) + T/c(1+r) \quad (9)$$

It may be noted, $\Sigma a_i p_i t_i = T$. The new price level after substituting equation (9) into equation (7) is,

$$P'' = P^*(1+t') = c(1+r)(1+t') = c(1+r)\{1 + t(1+T/c) + T/c(1+r)\} \quad (10)$$

$P'' = c(1+r)(1+t) + T + tT + trT$ (10)
 It may be recalled from equation (4) the pre-VAT price level is,

$$P' = c(1+r)(1+t) + T + Tt + Tr + Tr \quad (11)$$

Due to the VAT scheme, the term 'Tr' disappears from equation (10), but the revenue consideration forces the term $T + T(t+tr)$ to remain in equation (10). Therefore, the post-VAT price level is lower than the pre-VAT price level.

Revenue neutrality in the case of 'total cost pricing' with set-off implies,

$$[\Sigma a_i p_i(1+t_i) + w](1+r)t + T = [\Sigma a_i p_i(1+t_i) + w](1+r)t' \quad (12)$$

where t' is the post-VAT duty rate on the final good

$$t' = t + T/(1+r)(c+T), \quad c = \Sigma a_i p_i + w \quad (12)$$

New price level is,

$$P'' = (\Sigma a_i p_i(1+t_i) + w)(1+r)(1+t') - T \quad (13)$$

It can be shown that after substituting for t' , P'' is,

$$P'' = c(1+r)(1+t) + T + T(t+tr+rt) = P' \quad (see equation 4)$$

Needless to say, pricing on the basis of total cost is not based on sound principle under the VAT (or RAT by their terminology) scheme. A survey conducted by the NIPFP in 1990 revealed that out of 128 responses received, a majority (56 per cent) of them reported pricing on a net cost basis (A V L Narayana et al (1991)).² Therefore, we believe that their recommendation in favour of a CAT, because it can generate same revenue and identical prices with lower duty rates, is not correct. Consequently, the criticisms laid by the authors in their paper against the Tax Reform Committee Report and NIPFP (1994) are unjustified.¹

Engels and Women's Property Rights

B R Bapuji

THIS brief article offers a couple of comments on Bina Agarwal's (1994:12-14) claims with regard to her "significant departure" from and "critical additional point" to the "standard Marxist analysis" in general and Engels (1884) in particular concerning the links between gender subordination and property.

Bina Agarwal interprets Engels as arguing that gender relations are hierarchical in bourgeois families and 'egalitarian' in proletarian families. This is a wrong reading of Engels since Engels had simply observed that there is "no stimulus" to assert male domination in the absence of all property among the proletariat. Moreover, due to the position of woman as "the bread-winner" of the family, male domination in the proletarian home has lost its "foundation" except the "brutality towards women which became firmly rooted with the establishment of monogamy" [Engels 1884:72]. How can anyone interpret "brutality toward women" as "egalitarian gender relations"?

Bina Agarwal observes that Engels bypassed the issue of women's property rights altogether by advocating the abolition of all private property as the solution. This, again, is a misinterpretation of Engels since there is nothing that Engels "by-passed". If Engels argues for the retention of property rights of men alone, then we can conclude that he "by-passed the issue of women's property rights". Bina Agarwal therefore, does not base her conclusion on any solid ground. Further, Bina Agarwal is curious to know Engels' answer to the question: "What would be the impact on gender relations in propertied households if the women too were propertied as individuals?". This question is very abstract and elusive in that it does not specify the class nature of that 'property' or those 'propertied households'. Do these

households own/control 'bourgeois' property (that enables them to exploit the surplus labour of others) or small property of the independent producers or petty bourgeoisie (which involves the labour of all the family members including 'women')?

If Bina Agarwal is referring to the owning/controlling of the former kind of property by women, then the gender relations between an individual bourgeois propertied woman (wife) and an individual bourgeois propertied man (husband) would be 'egalitarian' because both these men and women need not work either at home (here the work is done by the domestic proletarians and not by the individual bourgeois propertied women) or outside (here the work is done by the industrial proletariat). But if Bina Agarwal is curious to know the impact of women possessing property rights individually on gender relations among the landless agricultural labourers or independent producers/peasants, then the gender relations would be either equal (if men also do the housework) or unequal (if women alone do the housework). The history of the Peoples Republic of China testifies this fact. The Chinese rural women participated in the anti-feudal agrarian revolution, got land rights individually in their names and yet all housework was left to them. Only in certain areas and only during certain brief periods (e.g. the Cultural Revolution), due to their struggle against the exploitative division of domestic labour, Chinese women were free from gender inequalities. This is what Engels' statement implies when he says, "The emancipation of women becomes possible only when...domestic duties require their attention only to a minor degree" (1884:158). Hence, what is needed is not simply the ownership/control of women over property but also a radical transformation of domestic division

of labour whereby "domestic duties require their [women's] attention only to a minor degree".

Since Bina Agarwal used the expression "Engels' analysis and associated discussions" it is not out of place to quote Lenin's (1919:71) analysis here: "You all know that even when women have full rights, they still remain downtrodden because all housework is left to them. In most cases housework is the most unproductive, the most savage and the most arduous work a woman can do. It is exceptionally petty and does not include anything that would in any way promote the development of the woman." Therefore, Bina Agarwal's claim that her argument that women should have individual control over property is a "critical additional point missed out in Engels' analysis and associated discussions" is untenable.

Bina Agarwal makes a theoretically naive observation that certain societies "underwent socialist revolutions" and yet "gender-egalitarian mechanisms of control" went "unrealised". She refers to Molyneux's (1981) essay 'Socialist Societies, Old and New: Progress toward Women's Emancipation' in support of her contention. The theoretical tragedy of Molyneux's essay and Bina Agarwal's conclusion lies in the fact that those societies never "underwent socialist revolution". Those societies either followed the path of party/state capitalism (e.g. former Soviet Union) or made unsuccessful attempts, merely preliminary attempts, at a socialist revolution (e.g. China).

According to Marx's *Critique of Political Economy*, a society is said to have undergone socialist revolution if and only if that society has revolutionised or is in the process of revolutionising the exploitative division of labour in such a way that no single individual (man or woman) is tied down to a single kind of labour whether it is housework or outside work, whether it is mental labour or manual labour, whether it is administrative tasks or performance tasks and so on.

"Are employees' dreams always a corporate nightmare?"

Today, three simple schemes from GIC Housing Finance answer no, no, and no again!

We all know that home is where the heart is. And that the heartiest incentive you can offer an employee is a home of his or her own.

To enable you to make such an offer, in a manner economical both in time and capital costs, here's your choice - firstly the line of credit "Through the Company" - your company deducts instalments from the employee's monthly salary.

Secondly, the line of credit "To the Company" - loans direct to companies that operate their own housing loan schemes

Thirdly, the "Employee's Housing Scheme" - loans to companies for the construction of staff quarters

Please contact us for details. They'll bring many a smile to many a face - rapidly!

UNIT TRUST OF INDIA
For your better tomorrow

One day you will stop working.

Invest wisely today and you won't stop spending.

Imagine wanting to buy something for your family and then holding back. Imagine saying no to life's little luxuries. Simply because you have no income flowing in. Fact is, you needn't ever see yourself this way. It's not what you've worked for. It's not what you deserve. If you agree, secure yourself with the Retirement Benefit Plan. And pick up Pension Units while you have the resources today. All you need to do is invest between the age of 18 and 60 years. The moment you do, you are entitled to a 20% tax rebate under Section 88 of the

I.T. Act. The Plan will do all the saving on your behalf. At 58, you will start receiving a monthly pension as lifelong security. Alternatively, you also enjoy the option of claiming a lumpsum saving. Of course, the earlier you invest, the more you stand to benefit. So start collecting Pension Units regularly. It's a sure way of ensuring that your life tomorrow is as secure as it is today.

**UTI
Retirement
Benefit
Plan**

Immediate Tax Benefit ■ Lifelong Pension ■ Lumpsum Saving

To know more, please mail the coupon below to: Zen Communications Pvt. Ltd, P. O. Box No. 6585, Worli, Mumbai 400 018.
Alternatively you could contact your nearest UTI office/agent.

Yes! I'd like to secure my future with Pension Units from UTI. Please send me the **free** brochure and application form.

Name _____ Address: _____
